CIRCULATES EVERYWHERE IN CANADA

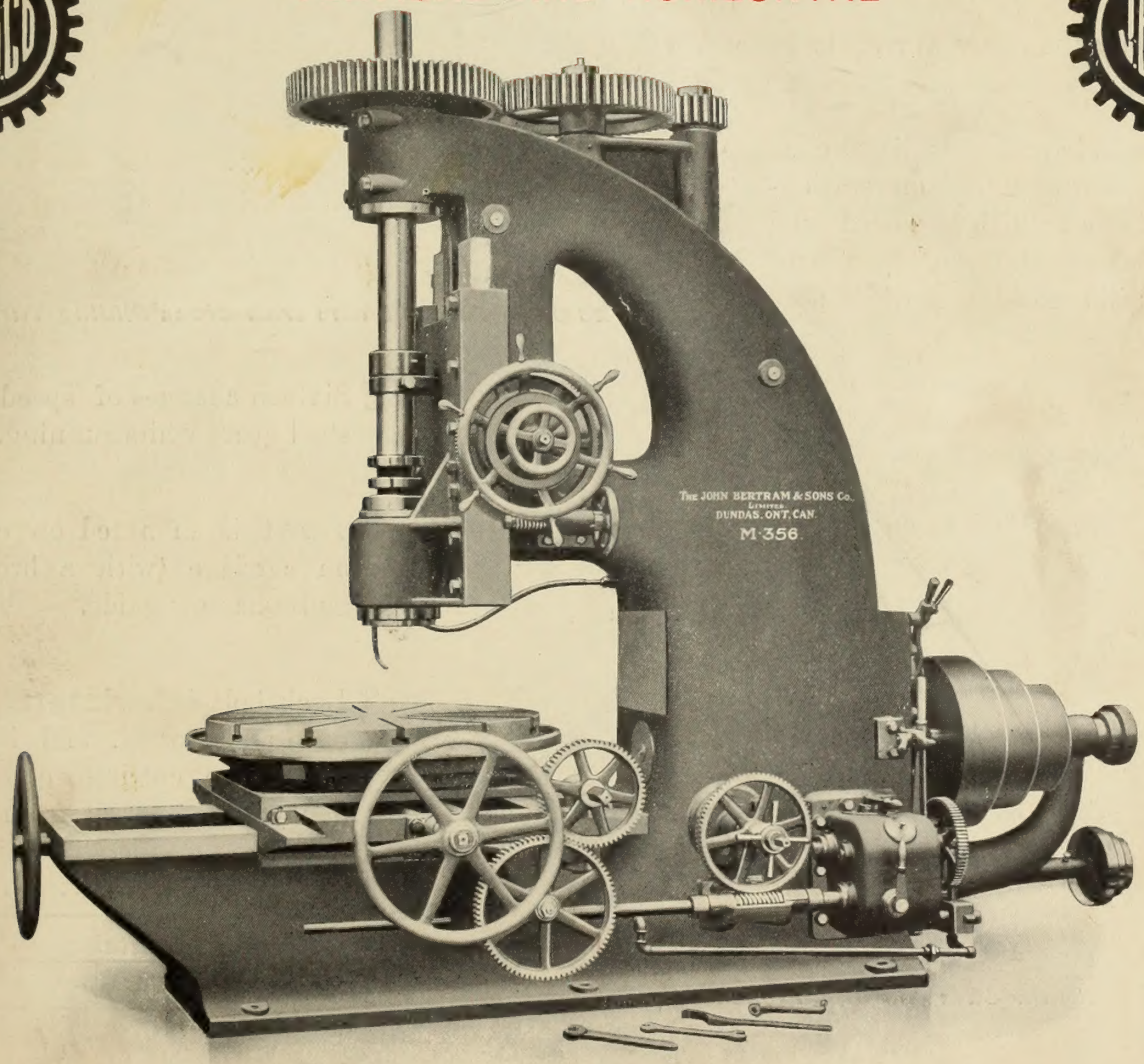
CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg, and London, Eng.

MONTREAL, 232 McGill Street. TORONTO, 10 Front Street East. WINNIPEG, 511 Union Bank Building. LONDON, ENG., 88 Fleet Street, E.C.

Vol. V. Publication Office: Toronto, January, 1909. No. 1

MILLING MACHINES
VERTICAL AND HORIZONTAL



No. 4 BERTRAM VERTICAL MILLING MACHINE

The spindle is of steel, 5" in diameter and counterweighted, Compound Tables having longitudinal and transverse movement by hand and power and 42" circular table. Tables have eight reversible feeds, and provision is made for self-supporting crane. Supplied with either belt or motor drive.

THE JOHN BERTRAM & SONS COMPANY, Limited
DUNDAS, ONTARIO, CANADA

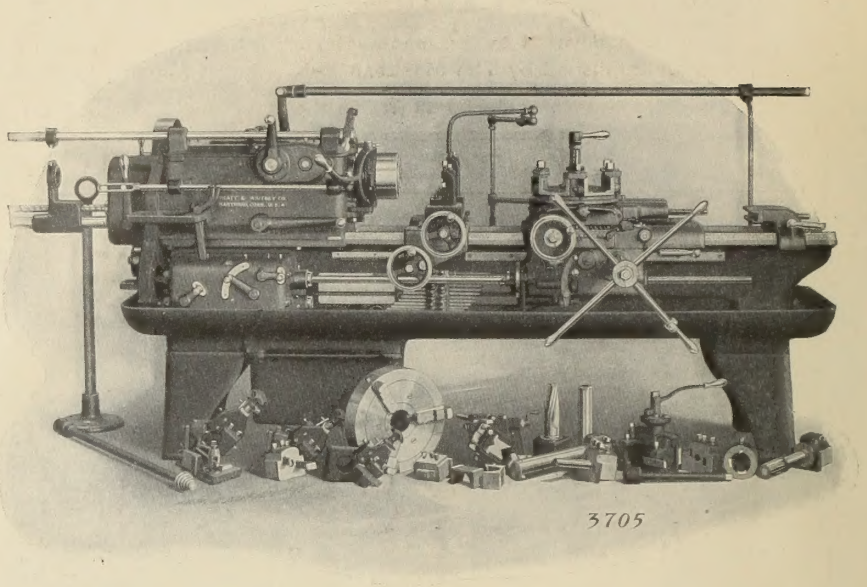
OPEN TURRET LATHE WITH CROSS SLIDING TURRET

Equally suitable for work on Bars, Castings and Forgings.

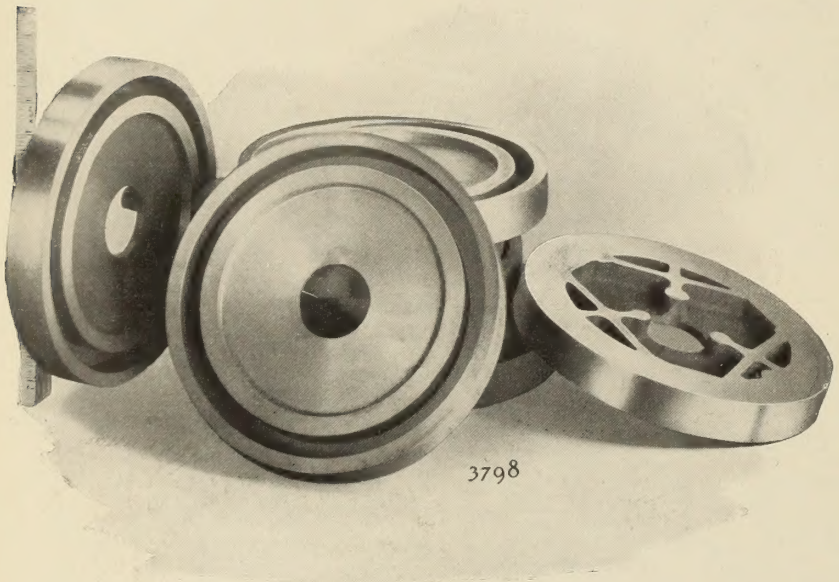
¶ The **open** Turret gives tools a **solid backing** as well as a solid seat.

¶ 30% heavier than any turret lathe of its size.

¶ Drive—single pulley or direct connected motor mounted on stationary head stock which is bolted solid to the bed. The most powerful drive to all turret lathes of its size.



2½ x 26 Open Turret Lathe with Cross Sliding Turret



A Few Samples of Chucked Work

¶ Sixteen changes of speed through steel gears while running.

¶ Turret is mounted on cross-slide on carriage with a broad base and a narrow guide.

¶ Lock bolt is **horizontal,** is hardened and ground, and is directly under the cutting tool. No tendency to lift turret from its seat.

Write to nearest office for complete illustrated Catalogue—"The Open Turret Lathe."

Turret Lathes.

A style and a size for every requirement.

Our catalog gives the details. It will be sent on application.

A Westinghouse motor direct connected to a machine has many advantages,

both direct and indirect, which result in economy, reduced labor and increased output. This means a decrease in the cost of the product per unit of output, and at the same time an increase in the revenue from the investment in costly machines and tools. The decreased cost will vary with different installations and operating conditions.

Ask nearest office for information.

18" Double Back Geared Engine Lathe.

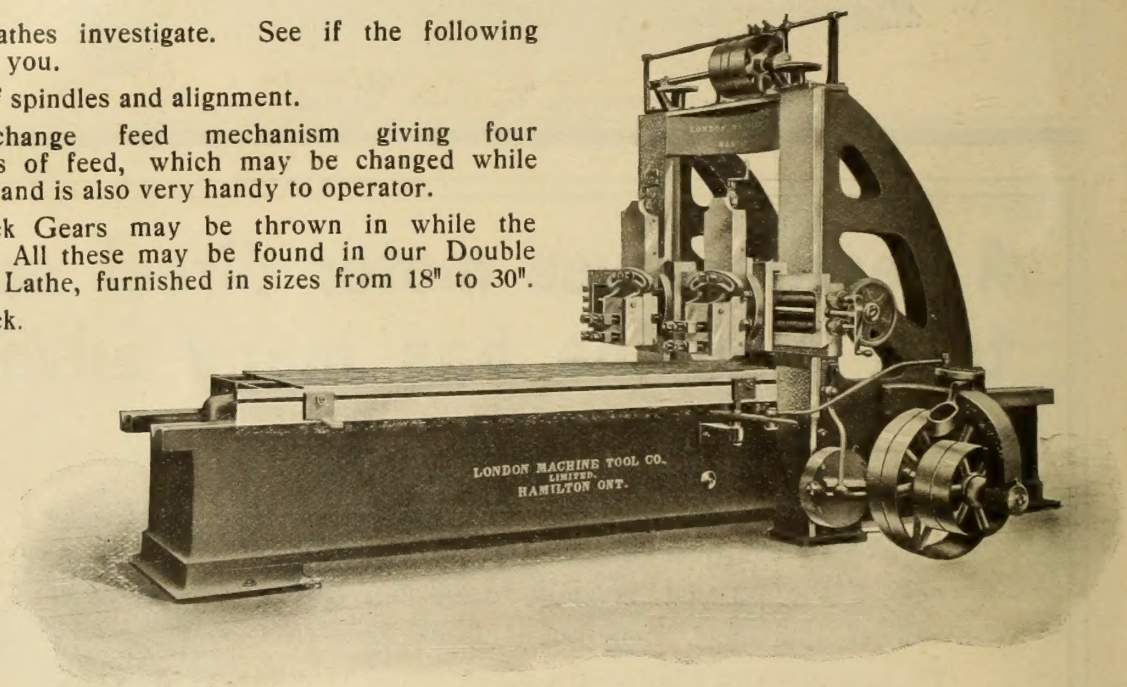
When buying Lathes investigate. See if the following features are furnished you.

Great accuracy of spindles and alignment.

Instantaneous change feed mechanism giving four instantaneous changes of feed, which may be changed while machine is in motion, and is also very handy to operator.

The Double Back Gears may be thrown in while the machine is running. All these may be found in our Double Back Geared Engine Lathe, furnished in sizes from 18" to 30".

18" and 27" in stock.



36" x 36" x 10' Planer.

Our Planers are built strong, heavy and powerful enough to handle the heaviest work of any modern shop, and also the use of High Speed Tools. They are absolutely accurate in all kinds of planing.

Saving in costs are sure results when the work is done on these Planers.

Built in sizes from 20" to 10'. 24" and 36" in stock.

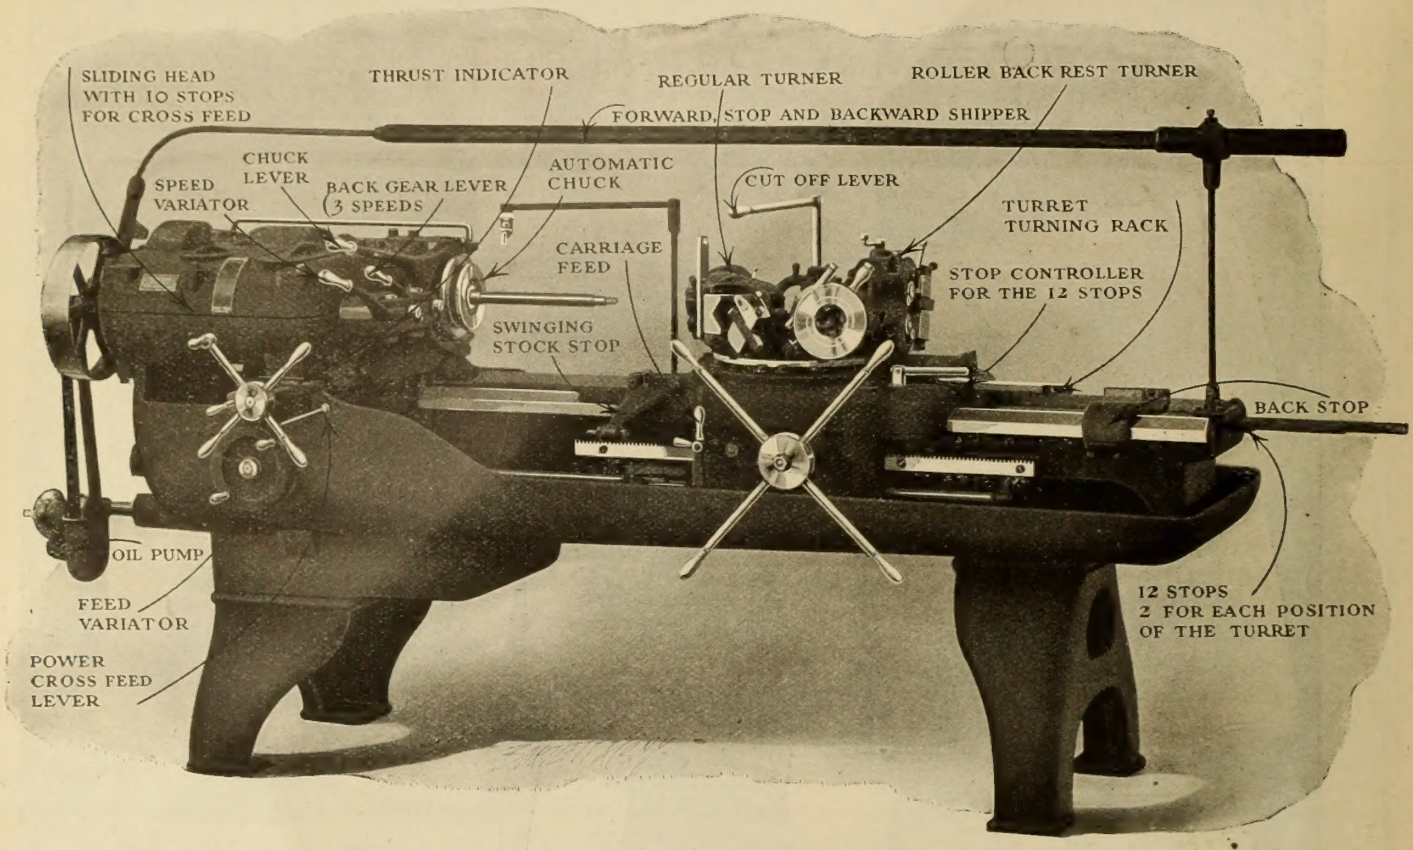
ACCURACY POWER-RIGIDITY.

THE

Hartness Flat Turret Lathe



Our entire plant is devoted to the building of Flat Turret Lathes exclusively. We have been following this policy of sticking to one thing for over twelve years.

SOME OF THE CHARACTERISTICS OF THE HARTNESS FLAT TURRET LATHE ARE

Originality in design—Unflinching control of work and tools
Accuracy of output

The Lathes are now equipped with outfit of tools for handling both bar and chucking work. This tool equipment is of the adaptable kind, taking care of all work within the range of machine—NO SPECIAL TOOLS REQUIRED. A change in your product does not call for a new tool equipment.

Our aim is to lead—not follow.

Our Catalogue gives full particulars, shall we send you a copy?

Here's a Good Drill

SELLING at a very attractive **PRICE**

Write for Particulars

The BAWDEN DRILL

Most powerful drill of its size on the market. Screw has quick return and automatic stop. Table is raised by a crank which retains its relative position to the table at all times. Shafts are steel, gears cut two to one; cone has four changes for belt. Drive pulleys are 8 in. in diameter with 3 in. face and will make 300 revolutions per minute. Many other good points and measurements explained in circular.

BAWDEN MACHINE TOOL CO.,

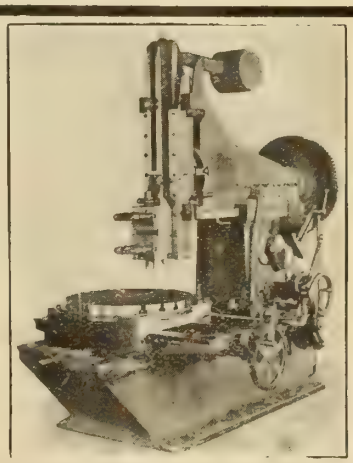
196 King St. West - TORONTO, ONT.

POINTS TO PONDER!

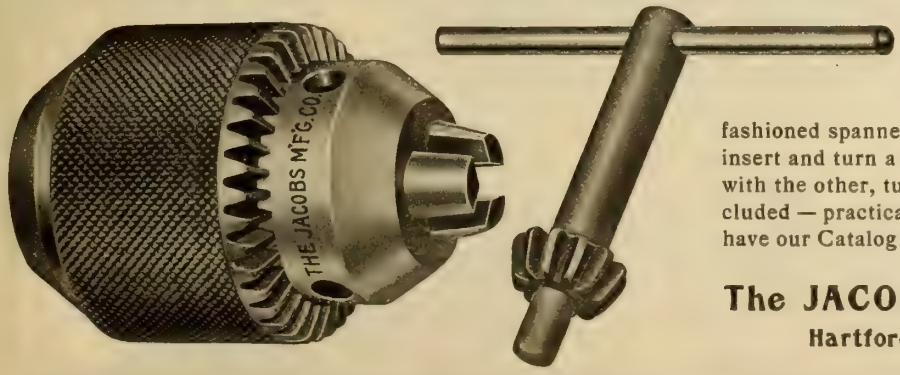
Here are some of the attributes that raise the **Dill Slotter** into a class by itself. **A Traveling Head**—greatly increases the range of the machine. **A Quick Traverse Gear**—great time and labor saver. **New Quick Return**—permits high and uniform cutting speeds. **New Intermittent Feed**—for feeding heavy work at high speeds. **A Continuous Feed**—for some work, very desirable indeed. **An Automatic Knock-Off**—A safety device for the feed mechanism. **Stroke Indicator**—Quite indispensable; nothing like it. **Hand Wheel Controller**—A good thing, and in the right place. **A Tool Post in the Relief Apron**—very handy in changing tools. **Six Changes of Speeds**—about four is the usual number. **Belt and Motor Driven**—designed for both; not a makeshift. **Powerfully Geared**—about double the usual ratio.



FREE BOOKLET FOR THE ASKING!

THE DILL SLOTTER PEOPLE, (33rd WARD) PHILADELPHIA, PENN.

"JACOBS" means "PERFECTION" in DRILL CHUCKS



Changing tools is such a simple and speedy matter when you are using the **JACOBS IMPROVED DRILL CHUCK,** that it is a sheer waste of time and energy to use the old-fashioned spanner chuck at all. With a Jacobs Chuck you insert and turn a key with one hand, take out and change drills with the other, turn the key once more and the job is concluded — practically instantaneously. Hadn't you better have our Catalog? Send for it now.

The JACOBS MANUFACTURING CO.
Hartford, - Conn.

Save on Your Gear Cutting!

by installing the best gear cutting machine you can get. It will pay you to investigate our machines. Since 1833 we have devoted ourselves to the development and improvement of this class of machinery with the result that every machine bearing the name of Gould & Eberhardt embodies many patented features not found in any other make of machine. The illustration shows

Eberhardt's Patent "New Type" Entirely Automatic Gear Cutting Machine for Cutting Spur Gears Only.

These machines are designed *in keeping with modern high speed steel requirements*, plenty of metal being distributed where most needed, and stout, transverse webs and bridges in main frame insure rigidity under the heaviest work machine is rated for.

They are entirely automatic in operation, so that one operator can look after several machines or do other work. Each movement is complete in itself, and cannot take place until all previous movements are fully and correctly completed; e. g., the movement of the worm and worm wheel must be fully completed before the cutter carriage can commence its work. The cutter carriage must have traversed the required length before it can return, and must be back in position ready for the next cut before the gear indexes for the next tooth. A very essential feature of the construction provides that unless the division of the worm wheel is made *complete*, the cutter carriage cannot possibly feed forward. This action always takes place entirely automatically, and requires no adjustment whatever for any size of gear.

All our "New Type" Machines are built according to our "Center Line Construction." The cutter and feed screw work in an imaginary central plane, which divides the main frame casting into two equal longitudinal sections, the cutter slide feed screw is located directly behind the cutter so that a direct central thrust is imparted, and the column which supports the work spindle head and indexing wheel provides an equalized support for the weight of gear blank, and also against cutter strain. This brings all strains and movements central, thus enhancing the stability of the machine, and maintaining accuracy; there are no one-sided or overhanging strains. In short, accuracy, maintenance of alignment, equalization of pressure and wear, general stability and increased output are insured by this principle of construction.

One new No. 1 foot-power press.

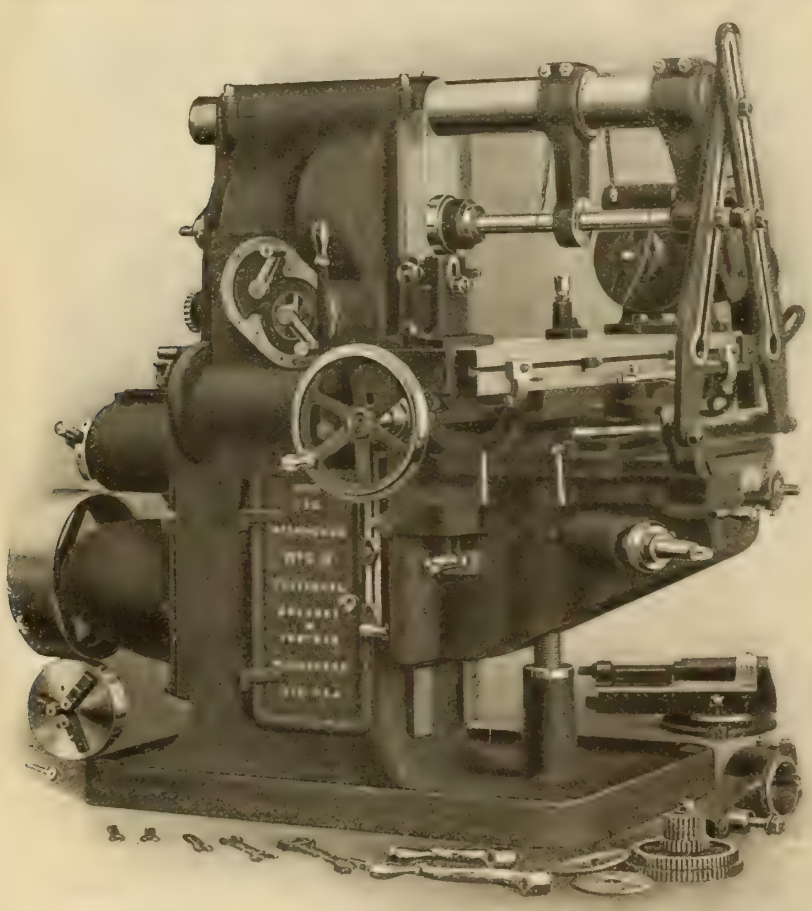
GRINDERS

One new cutter and reamer grinder
One refitted stove plate grinder.
Two new American centre grinders
One nearly new No. 10 motor grinding attachment.
Twelve new pedestal grinders.
Six new bench grinders.
One automatic surface grinder.
One new No. 2 water tool grinder
One double-wheel water tool grinder
One new bench twist drill grinder

MISCELLANEOUS

One new 30" Gisholt boring mill
One refitted 36" Gould & Eberhardt gear cutter.
One 8"x18" Bell steam hammer.
One 5½"x18" Bell steam hammer
One No. 25 Bradleyhelve hammer.
One 18" Bremer punch and shear
One 12" Bremer punch and shear.
One 87" plate-bending rolls.
One 48" hand-power bending rolls
One new No. 6 Fox tube cutter
One new 16" Globe tumbling barrel.
One new 2" cutting-off machine.
One new Buffalo tire upsetter.

H. W. PETRIE, Ltd., Toronto, Montreal, Vancouver



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

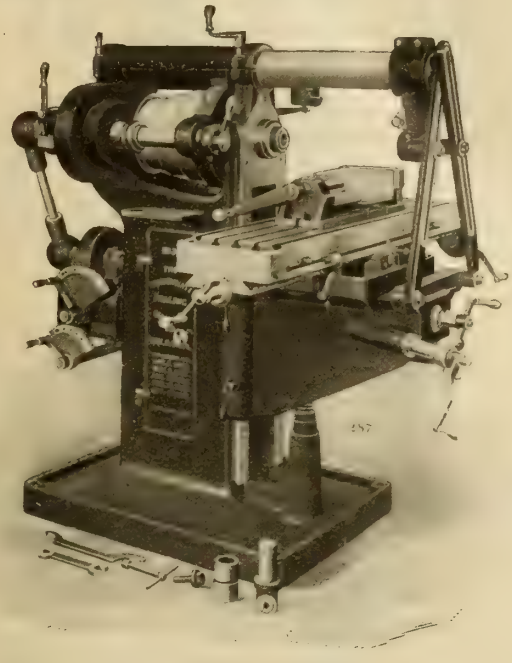
Cincinnati Cone Driven Millers

For Medium Service



No. 3—PLAIN MACHINE

These are the machines that have enabled us to break all rapid milling records during the past few years. They are big enough and have sufficient cutting capacity to meet the requirements of most shops.

We intend, therefore, to continue to supply them in all sizes—Plain and Universal.

Our new line of High Power Machines are intended for the severest service, on work requiring heavy, fast cutting.

For medium service we recommend "Cincinnati" Cone Drive Millers.

We are Milling Specialists

Cincinnati Cutter Grinder Improvements

TAPER GIB FOR ADJUSTING SLIDE
MORE SUBSTANTIAL STOP DOGS WITH FINE ADJUSTMENT
STIFFER KNEE

A Few Important Features

KNEE SWINGS ABOUT COLUMN TO ANY ANGLE
and table swivels about fixed centre on slide bringing work into any desired position to emery wheels.

GRADUATED DIALS
on all swivels and adjustments.

A QUICK LEVER FEED
for sharpening cutters and also a slow screw feed for other work. Uses **cup-shaped wheel** for sharpening cutters.

HAS MICROMETER ELEVATING DEVICE
for setting cutters or reamers for desired clearance—and on this depends the successful working of these tools.

SOME THINGS IT WILL DO
It will sharpen all manner and shapes of cutters, reamers, etc. Will do internal cylindrical, surface angular and face grinding.

IT WILL SAVE YOU MONEY
because it will sharpen cutters, reamers, etc., correctly and quicker than any other similar tool. It is simple and convenient to operate. Any boy can run it.

No Use Having Two Machines When One Will Do the Work!

An ingenious and high-grade machine.

Both sides independent.

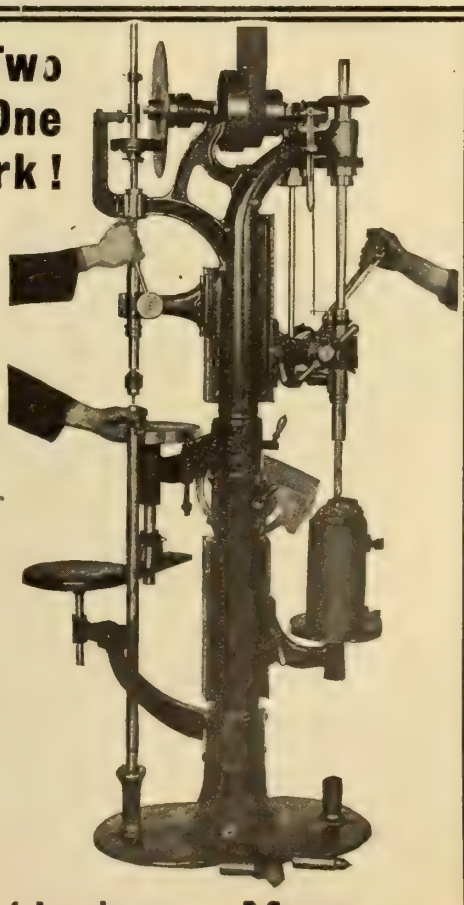
One side, sensitive drill with variable speed friction drive. Capacity up to 7/16 inches.

Other side, regular power or hand feed drill. Capacity up to 1 inch.

Removable seat to be used on either side if desired.

Knee feed drill, sensitive drill, manufacturer's drill. It's all there.

Look at illustration and write us for more information.



Lapointe Machine Tool Co., - Hudson, Mass.

EFFICIENCY
IN A
GRINDING WHEEL

is measured in two ways—
The amount of work done in a day—
The number of days the wheel works before wearing out—

That means the hardness and sharpness of the material of which the wheel is made.

Carborundum

Grinding Wheels are made of Carborundum, and Carborundum is the hardest abrasive material that has ever been discovered.
It is also the sharpest—

And, as it is a manufactured abrasive, it is always uniform—
The wheels you get next week or next year will be exactly the same as the wheels you get to-day—

And if you get the right grade for your work, they will do your work better and more economically than any other grinding wheel on earth.

Have you had the
Carborundum Book?

THE
Carborundum Company
Niagara Falls, N. Y.

It's no trouble to grind

tools if you are using BLOUNT'S NEW IMPROVED WET TOOL GRINDER. It has a vertical centrifugal pump which is guaranteed to furnish a constant and easily controlled supply of water. A loose sleeve cap encircles the pump shaft up to a point above the water-line, preventing leakage without the use of packing. There is no wear of parts because the propeller is so loosely fitted that it does not touch the case at its nearest point; so grit and dirt positively does not affect it. It is equipped with self-oiling bearings throughout and has many other features possessed by no other machine.

Norton Grinding Wheels are made of Alundum

Grinding Wheel Economy

The sooner users of Grinding Machines and Grinding Wheels know their conditions thoroughly—their machines, the material, proper speeds for wheel and work, wheels of proper grain and grade for the work—the sooner they will reduce grinding costs to a minimum.

"Saving the wheel" should not be considered ahead of maximum production. Big production means wheel economy. Using wheels that are too hard for the work, or running them above the recommended speed to "save the wheel" is *not* economy.

Maximum production and maximum economy are sure to result from the use of Norton Grinding Wheels made of a sharp-grained, right-tempered abrasive, Alundum. "Norton experience" is surely worth something to you in connection with such matters as grit and grade, speeds, etc.

New Machine Tools

TAKE a look over your machine tools. You will soon have to make some replacements—some additions. You *need* new tools.

¶ How about your engine lathes? Have you been using them for a class of work you should have done on Gisholt Lathes? One Gisholt, you know, will do as much chucked work as two to four engine lathes. There's twenty years of successful experience in "making good" behind that statement.

Why not ask what we can do for you?

¶ Ask about Gisholt Lathes, Boring Mills and Tool Grinders. A new booklet we have issued recently will interest you. Write for it.

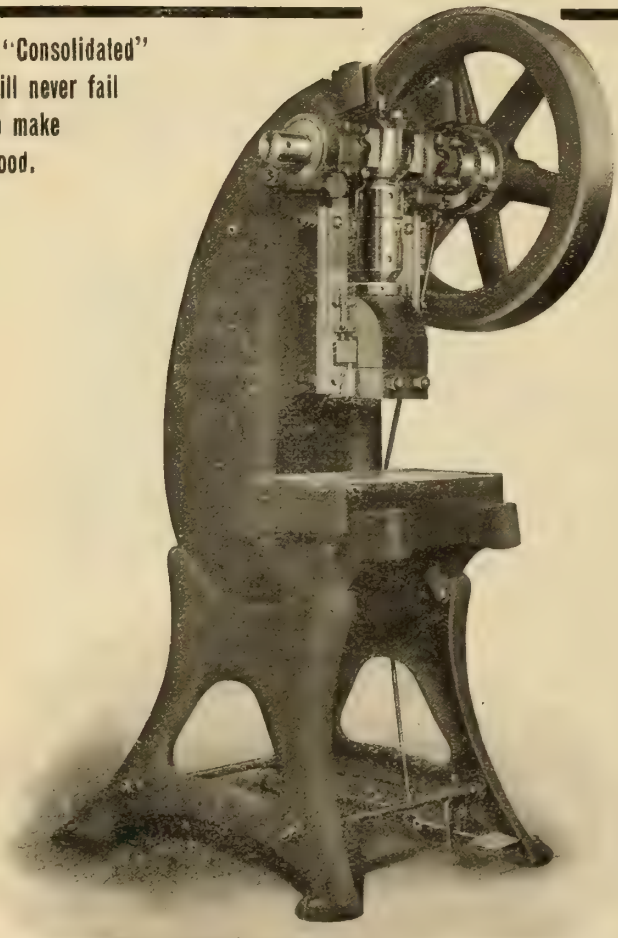
MONTREAL

A "Consolidated" will never fail to make good.



Here Is a Money-Saver !

We know that you are always on the lookout for ways to save money and reduce your cost of manufacture.

We are confident that we can **PROVE** to you beyond a question that "Consolidated" presses will save a percentage of the time of your operator varying from 10% to 25%.

The "Consolidated" has all working points directly in front, within reach of the operator, so that there is no time lost in trotting around to the back of the press to make adjustments.

'Consolidated" presses have a connection that will stay where you put it (no matter how often you change it), and a clutch that will run day after day without jamming. This feature alone should save an hour a day—at 20c. an hour, three hundred hours in the year, a total of at least $60.00.

Will you not permit us to demonstrate the truth of our claim? At any rate write for a copy of our new catalogue for your library.

The "Philadelphia" Grease Cup

Automatic application of grease to the bearings without the use of spring compression.

Nature Supplies the Feeding Force in the form of Compressed Air

The combination of the "Philadelphia" Cup and any good cup grease on the market insures satisfactory lubrication with a saving of at least 50 per cent. over any other system. That is our guarantee, and thousands of our cups in daily operation are more than "making good." If you want to know why and wherefore, drop us a postal. We are here to answer questions.

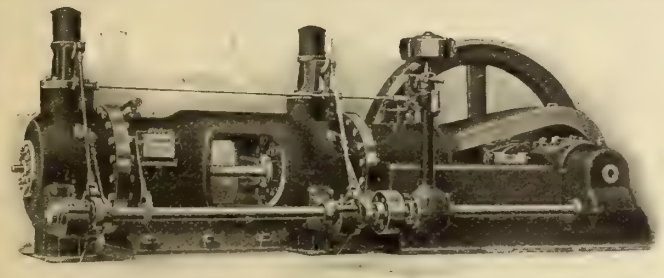
Cheaper than Steam

You are interested in a form of power that is cheaper than steam. You are still more interested if it is not only cheaper, but every bit as **reliable.** Skeptical, eh? It may help to convince you that such a form of power is at your disposal when you know that more than 10,000 h.p. of

Warren Gas Power Plants

operating every day within four hours' travel of Toronto are proving to be every bit as reliable as steam and a great deal cheaper. As a power user you are interested enough in these claims to ask for **proof.** It means money saved for you if we are stating the truth. A request on your business letter paper will bring the proof along.



Cut shows the Warren Tandem Type Machine. Sizes to 1000 h.p. Engines of this type operating within a day's travel of Toronto have established world's records in fuel economy.

A Basis of Success

By Henry Clews, the New York Financier

A WISELY advertised product gives its sponsors credit standing. For confidence makes credit; and knowledge is absolutely necessary to confidence.

Big advertising looks like big sales; it familiarizes; it unconsciously creates trust.

Beyond all question of doubt, the greatest force working in the interest of credit to-day is publicity.

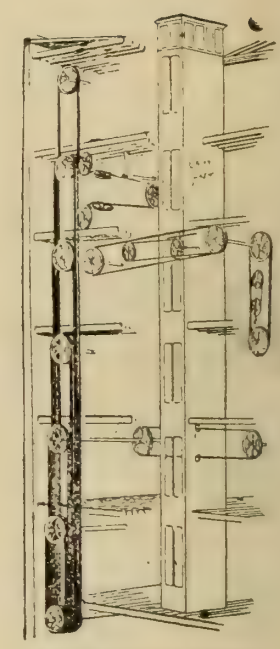
Vertical Drive



Driving the Entire Building

It often happens in a mill or factory that power is wanted at some remote corner of the plant. There may be an abundance of power at the engine or main line shaft, but the question arises, how are we to get that power to where we want it, and in the most economical way? This is just where we come in! We are Rope Drive Experts. We design, manufacture and install Drives complete.

Remodelling a Large Plant with an Interesting History

The Old Engine and Boiler Works of Bertram Engine Works Co., Toronto, Purchased by Berg Machinery Mfg. Co., Have Been Completely Remodelled, Considerable New Machinery Installed, and Old Machinery Completely Renovated.

The Berg Machinery Mfg. Co., Toronto, successors to the firm of A. Berg & Sons, engineers, who began operations in Canada four years ago, have acquired the extensive foundry and machine shops formerly operated by the Bertram Engine Works, which was one of the largest establishments of the kind in Canada.

In 1893, the Bertram Engine Works, Co., Ltd., succeeded the John Doty Engine Works and almost every year since 1893 new machines have been added to the plant and other improvements made. It will, no doubt, be interesting to give a short history of the growth of the works now occupied by the Berg Mfg. Co.

John Doty & Sons, started in a small way building gas engines on the east side of Bathurst Street, near the water front. The gas engines worked with illuminating gas and were built in quantities. They were crude affairs, compared with those of to-day, but found a ready and large sale. This company built the Primrose and Mayflower, two boats for the lake trade. They built a large machine shop on the present site in 1892, and carried on a large business until they moved to Goderich. The Doty Engine Works at Goderich are now carried on by Fred Doty, son of the founder of the John Doty Engine Works Co. The two sons, Fred. and his brother, built a sand pump when at Bertrams, which firm they managed for a time after their works were sold out to the Bertrams.

At the Bertram Engine Works, were constructed marine craft of all descriptions, including the wide range running from shallow draft launches to the largest and staunchest vessel for freight-carrying and for passenger service. Six grain barges were built for the Prescott Elevator Co., in 1897-1899, and a number of side-wheel tugboats for the Upper Ottawa Improvement Co. Six of these are still in service. The large passenger steamers, Corona, Toronto, Kingston and Montreal, were built at the Bertram Works.

Connected with the works were large shipyards, which are now used as a dock under the management of J. W. Gerrell, formerly general manager of the Bertram Works.

Fig. 2—The Office.

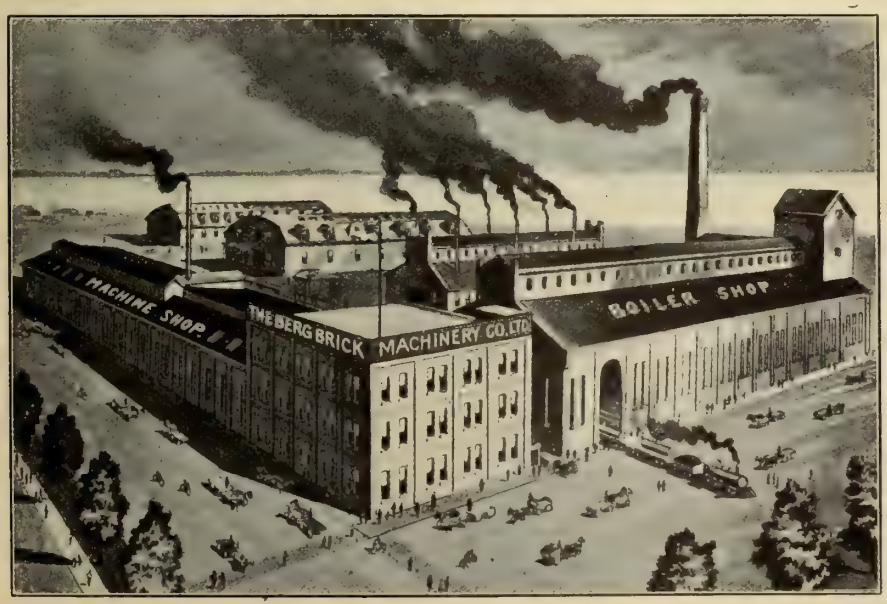

Fig. 1—Bird's-eye View of the Berg Machinery Manufacturing Co.'s Plant.

The first president of the Bertram Works, was Geo. Bertram, who was followed by his brother, John, and afterwards Robert, son of John Bertram.

The Bertram Engine Works constructed and erected engines up to 3,200 horse power of different designs. The output of the Bertram Works is to be found as far north and west as the Stickeen River, B.C., and as far east as St. John, N.B.

In 1895, the Bertram Works was absorbed by the Canadian Ship Building Co., consisting of Fred. Nicholls and associates. They afterwards built a ship yard at Bridgeburg, and the Bertram plant was sold to the Berg Machinery Mfg. Co. Since this latter company took hold of it the works have been completely remodelled, considerable new machinery installed, and the old machinery completely renovated. Before taken over by this firm the works were in bad shape, but the work which has been put on the several shops during the past year have made them practically new. New equipment, which has been added, in the way of tools, traveling cranes, etc., make the plant quite up-to-date.

It may be interesting to note that the first Berg brick press built in Canada was made at the Bertram Engine Works. Besides, a line of brick machinery the Berg Machinery Mfg. Co. intend to make producer gas plants, the patents for which the company now have, gas engines, cement machinery, mining machinery, including crushers, pulverizers and concentrators, engines and boilers.

Anton Berg, inventor of the Berg Brick Press, has had about twenty years' experience with the highest grade of brick machinery, and is a mechanical engineer. He is a Norwegian by birth.

He is assisted by John Berg, the eldest son, and Severn, junior member of the firm, who has learned his trade as a machinist and mechanical engineer. His son, Charlie, is at present learning his trade in the works. Over two hundred of the Berg presses are now in use in the United States. In the four years they have been in Canada, twenty-three brick factories have been equipped with Berg presses.

The corner building shown in Fig. 1 was formerly taken up as a machine shop. Now handsome offices have been built on the first floor on the west side of this three-storey building. In the offices are large vaults. The half-tone Fig. 2 does not do justice, because the color scheme is lost to some extent. It shows a sample of brick from every factory in Canada that uses the Berg machinery. It is the most striking silent argument in brick. The vault is arranged for records, plans, drawings, etc. A complete laboratory is being equipped so that customers can supply samples of their material,and have the press made to suit the grade of brick, which can be turned out with the available material.

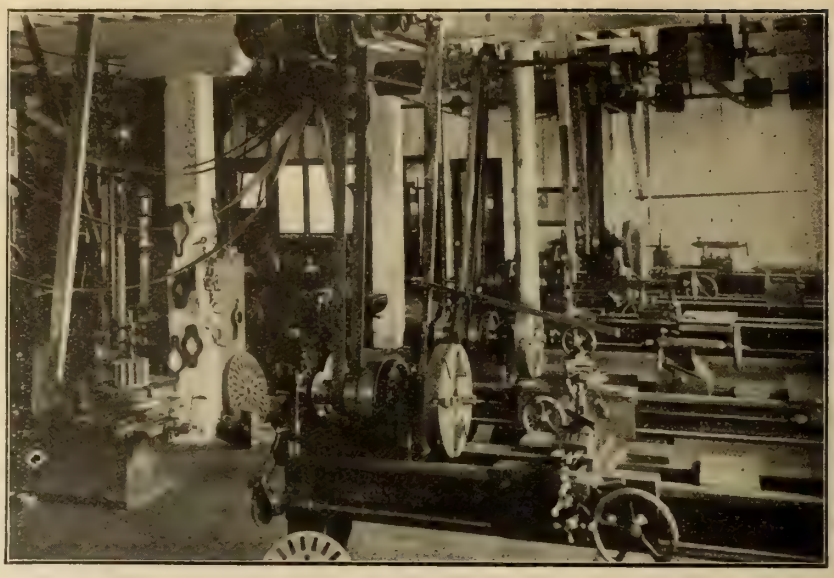

Fig. 3—Machine Shop.

The machine shop occupying the remainder of the first floor of the three-storey building is shown in Fig. 3. All the machines have been over-hauled and arranged in order so that the shop presents the appearance of a model machine department. Fig. 4 shows the erecting shop with several presses ready for shipment. Traveling cranes have been installed greatly facilitating the handling of the machinery. Lathes are arranged

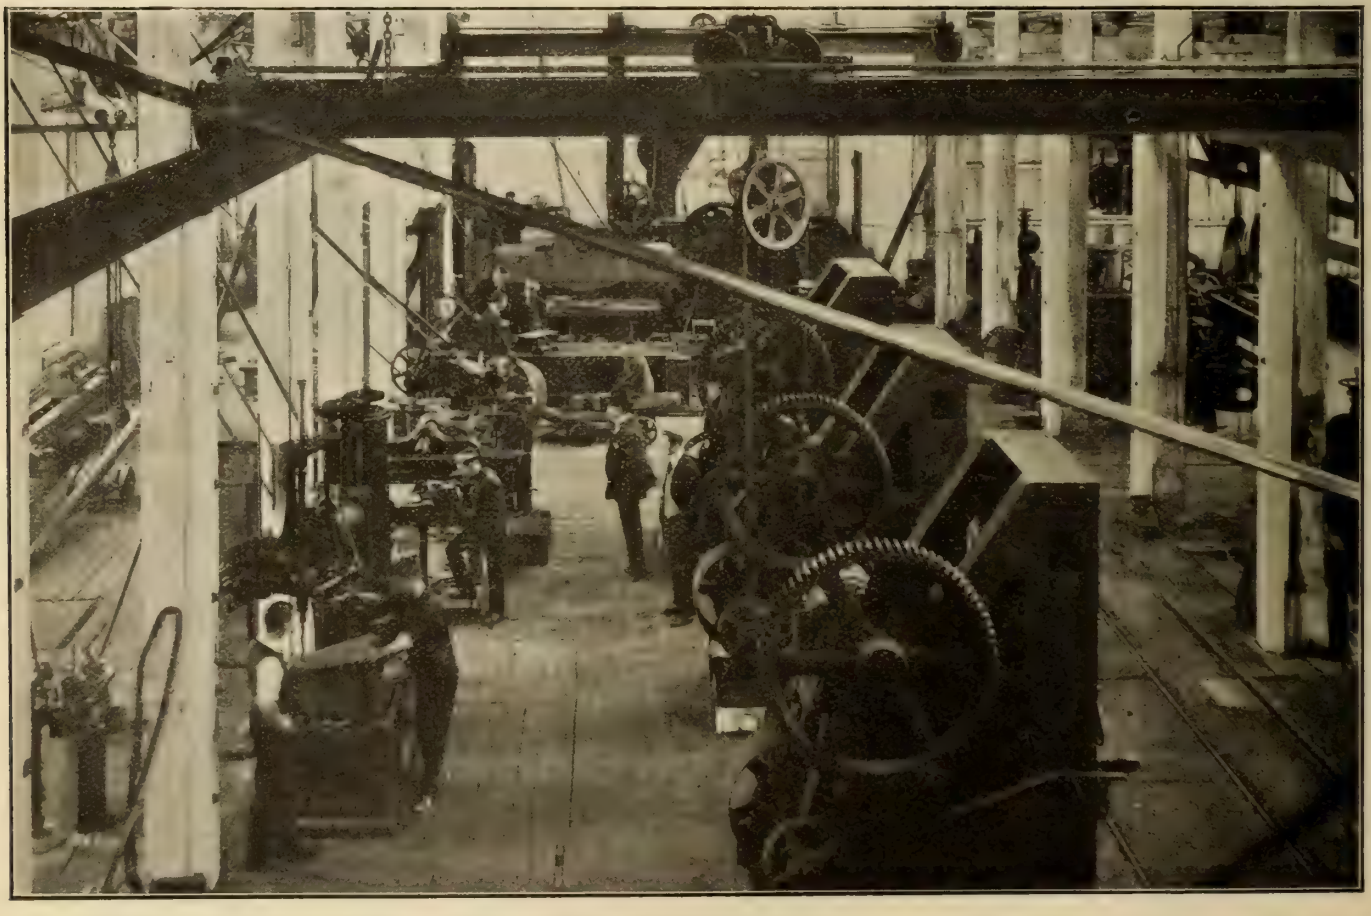

Fig. 4—Eastern Machine Shop and Erecting Shop.

beside the windows and the heavy machinery has been put on concrete foundation. Previously, the floor was built on posts, but this has been changed and the machines are given great rigidity, by having the foundations cemented into the walls. This greatly reduces the insurance risk. A steel stairs leads up to the second storey to the tool room. At the head of the stairs is a lookout so that a foreman can watch both the tool room and the machine shop. These shops contain many machine tools, which have been in use for several years. These have been repaired and are now as good as new. Among the machines in this department are those from the works of John Bertram, Bertram & McKechnie, London Machine Tool, Becker-Brainard, Imperial, Canada Machine Co., Sarnia, etc. Some of these machines are specially built, one boring mill accommodating work sixteen feet in diameter, and one planer being 72 in. by 72 in. by 14 ft., with three heads on cross-rail. A tool room has been arranged on the ground floor and all the tools have been gathered from the machine shops and arranged systematically on shelves.

In the corner building on the second floor is the private office formerly occupied by George and John Bertram. John Bertram, who was a brother Scotchman of the late John Bertram, Dundas, was quite aesthetic in his tastes as the plaster casts still on the walls of his private office indicate. Four pastoral scenes represent, L'Automne, L'Hiuer, L'Ete and Le Printemps, all of which are very artistic.

On the top floor of the corner building is the pattern shop equipped with the necessary tools and machinery for pattern making. A small store room for patterns in constant use is also on this floor.

At the east end of the machine department is the foundry, equipped with two large cupolas with a capacity of fifty tons per day. Four large gib cranes cover the whole of the foundry.

In a large building in the rear is the old erecting department. The machines from this building have been placed in the over-hauled machine shop, and it is now used for storing steel, boiler tubes and patterns. The patterns are all indexed and a duplicate index is kept in a book in the office so that any pattern may be easily found.

In the flange shop the company can turn nine-inch flanges on one-inch plate. The hydraulic flanger used in this shop can exert a pressure of 200 tons or 2,000 lbs. to the square inch. This machine has turned a 10½-in. flange at the rate of about 4 ft. every twenty minutes.

Fig. 5 shows a view of a corner of the boiler shop after it was overhauled. The boiler shop is fully equipped with the heaviest and most costly machinery on this continent, Scotch, German and United States manufacturers' names showing upon the nameplates of the builders. A radial drill from Smith Bros. & Co., Glasgow, will accommodate work 14 ft. wide, and 10 ft. high. A large set of rolls each 26 in. in diameter will accommodate work 22 ft. long. A 50-ton crane has an 80 ft. lift, and is used in connection with an hydraulic riveter built by A. Thompson, Fitchburg, Mass. There is a large assortment of other rolls, punches, planers, boring mills, radial drills, etc., all arranged so that work will pass through the shops with greatest facility. Each machine has its own jib crane. Large marine boilers and hardening cylinders for brick are manufactured here. These latter are three-quarter-inch steel plate, 76 in. in diameter and 65 ft. long. Each cylinder will cure 20,000 bricks under steam pressure in from ten to twelve hours. These each weigh 27 tons. An elevated foreman's office has been erected at one end giving a full view of the boiler shop.

Fig. 6—Boiler Shop.

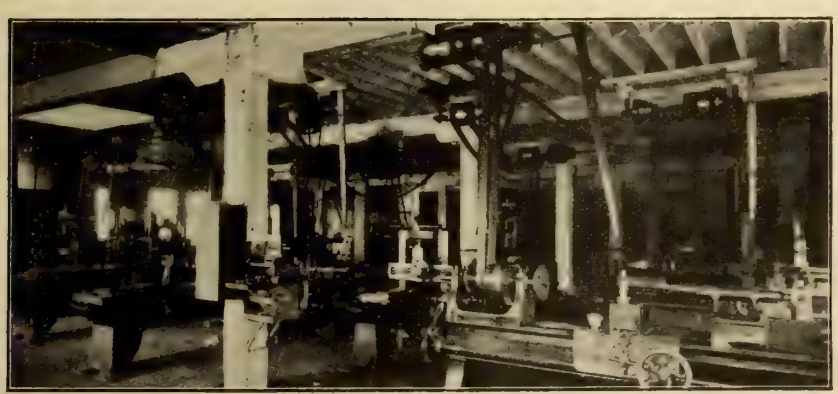

Fig. 5—Tool Room.

In the engine room is a John Doty engine, of 90 h.p., built sixteen years ago. It is still in good order. This engine supplies part of the power. There are also two compound air compressors, supplying compressed air to the boiler and machine departments.

The forge shop contains five forges and a steam hammer made in the Bertram Engine Works. The whole plant covers about five acres. Supplies are brought in and shipments made by means of a G.T.R. spur track. A 15-ton

yard crane is used for loading and unloading. Tracks run into the machine shop and machines are easily moved to the point where shipment is made.

It is expected that when the plant is working to its capacity it will employ about five hundred hands. The works having been remodeled and made ready for manufacturing, the Berg Machinery Mfg. Co. expect that with the present bright prospects, this will be at no far-distant date.

WELDING LOCOMOTIVE FRAMES.

By A. W. McCaslin.*

On the Pittsburg & Lake Erie railroad we repair some of the engine frames as many others do at this time, without removing them from the engine. We have very good results in the heating, as far as appearance of the completed job superficially would indicate, but I do not say that we weld these frames, for I do not consider such an operation made without a lap of some kind deserving the name "weld." In fact, this butting of frames is simply a burlesque on proper welding. I have satisfied myself as to the virtue of this so-called weld by making several in the shop, giving them many advantages that cannot be offered on an engine, and invariably they would separate showing very little resistance, from the light blow crosswise of the weld under a small steam hammer. The breaks would show that a union of the metal had been effected, but would also show a very feeble tenacity. Yet knowing these facts, I am very much in favor of repairing frames this way wherever it is possible to spread the frame and take the heat, as it frequently keeps the engine in service until its time comes for general repairs, and this means quite a saving in money to our companies.

We have what we think, splendid burners, and build a very satisfactory furnace with standard size firebrick. Mr. Shoenberger, foreman blacksmith, in the Fort Wayne shops at Pittsburg, kindly furnished me the original design for both of them. See Fig. 1.

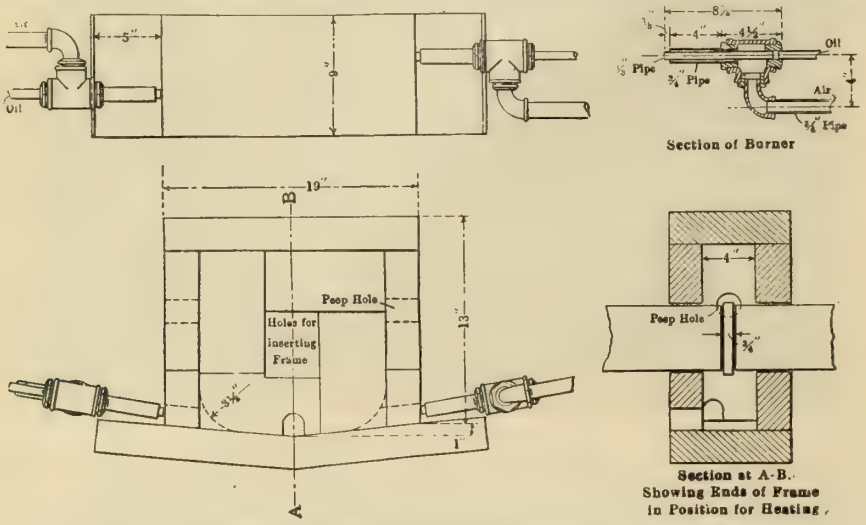

Fig. 1.—Frame Welding Furnace.

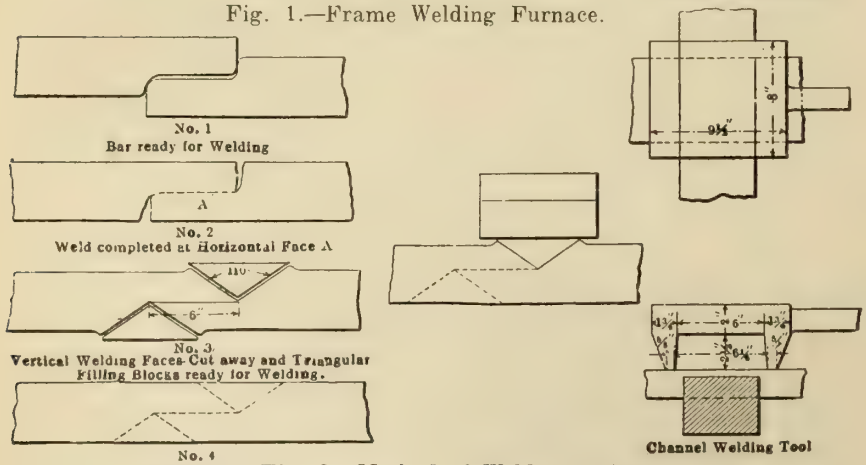

Fig. 2.—Method of Welding Triangular Bars.

I build the furnace with the bottom inclined, as shown in blueprint, making it about 1 inch lower at its centre than at the fuel holes at the ends. Have also added a small slag hole at the centre near the bottom, so the slag will not gather and be blown up against the frame. We use two burners to this furnace, and crude and carbon oil as fuel, and take a very slow heat. The bottom inclined as mentioned, helps to prevent the wasting of the bottom side of the frame and gives the heat a start to return over the top of the frame and out the peep hole. When the heat is complete the furnace is pushed away into the pit and the work completed with light sledges.

I do not approve of making the side V-weld under a heavy steam hammer without using a channel tool. The "laid-in" piece travels or flows both ways from its centre, crosswise of the frame, without interference or resistance, and does not spread enough with its angle to increase the lap or to weld properly against the walls of the V out in the frame. That is, it cannot weld properly while flowing in a direction paralleling the walls of the V in the frame. This piece will travel alone, the bulk of the frame preventing the walls of the V-cavity following. If we cut off the ends of this weld it will appear all right, the drag of the iron being just sufficient to hide the weld. The iron in the piece laid in will not be compact near its ends, neither will the weld near its ends be meshed to a sufficient depth.

This will be entirely different, and is a satisfactory piece of work, if done under a small steam hammer with light blows, or with heavy sledges. In this case the laid-in piece should be properly made, and the overhang not cut too close to the frame. The side heats should be drawn well up to the point of the V-piece, and this stock driven back into the weld and at the same time form a lap where it is so much needed, that is at the ends of this weld on top and bottom of the frame back.

If the side V-weld is made in a frame under a heavy steam hammer there should be a heavy channel tool placed on top. This tool should be 8 inches wide, cut out 2½ inches deep, ½-inch longer in the crown, and ¾-inch longer at the mouth than the cross-section of the frame, that it may release readily. It will shear off the extra stock, prevent the laid-in piece from lengthening endwise, will drive it back into the weld, force it against the walls of the V and lengthen the lap lengthwise the frame. Then take a second heat on the laps and there will be no hole or opening at the points of this weld. This is not only the most convenient weld to make in repairing frames but it is the best.

We sometimes make in the front sections of frames and in large hammer piston rods, what we call a lap and V-weld. We flatten the end of each piece nearly one-third, make the lap and weld as shown in Fig. 2, then drive back the end of the laps and lay in a V. This insures a solid centre and a solid side opposite each V, which throws the laid-in pieces about 6 inches apart. This weld will elongate evenly when being reduced and will not slip nor shear as the ordinary lap or V-weld will.

* Paper before the International Railroad Blacksmiths' Association.

New Departure in Metal Cutting Tools Without Clearance*

This Paper Sets Forth a Turning Tool that is Intended to Cut Without Clearance—It is a Radical Departure in the Practice With Cutting Tools.

By JAMES HARTNESS

The tool consists of a cutter and a holder so constructed as to allow the cutter a slight oscillatory freedom in the holder. The centre line on which the cutter oscillates is substantially coincident with the cutting edge. The oscillation of the cutter about the centre line does not affect the position of the edge, but it does allow the face of the cutter to swing around to conform to the face of the metal from which the chip is being severed.

The objects of this construction are to make possible the use of more acute cutting edges in order to reduce the cutting stresses; to equalize wholly or partly the unbalanced side pressure on the cutting edge; and to obtain a rubbing contact to prevent lateral quivering.

In order to bring out these objects it is necessary to analyze briefly some of the conditions under which metal is worked in a lathe, dealing particularly with cutting angles, clearance of cutting edges, and the importance of minimizing the tendency of the work and tool to separate under cutting stresses.

No attempt is made to discuss the forms of cutting edges for withstanding the heat of high speed service. The generally accepted cutting angle of greatest endurance under high speed is about 75 deg., and the angle of least resistance, according to some of Dr. Nicolson's tests, is about 60 deg., with an increase below as well as above that angle.

The cutting angles of the tool described in the present paper may be varied from the present orthodox angles down to 30 deg. or less, according to the nature of the work.

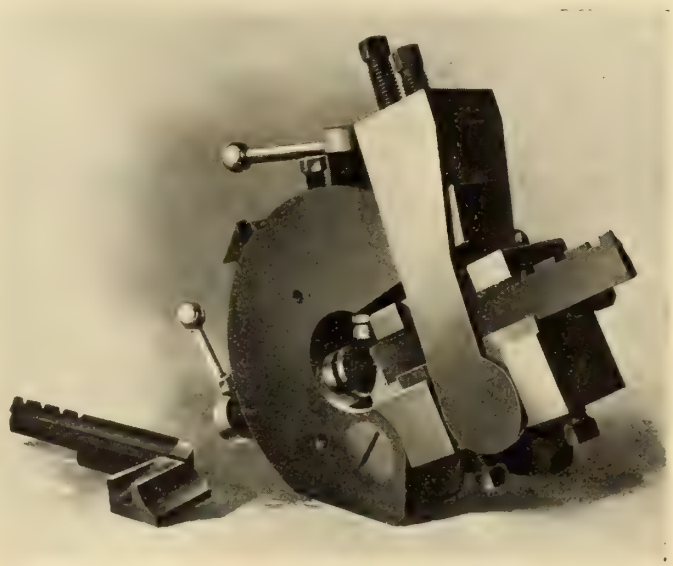

Fig. 1—The No-Clearance Turning Tool for Flat Turret Lathe. This Tool has Double Attachment for Turning Two Sizes. See Figs. 4-6.

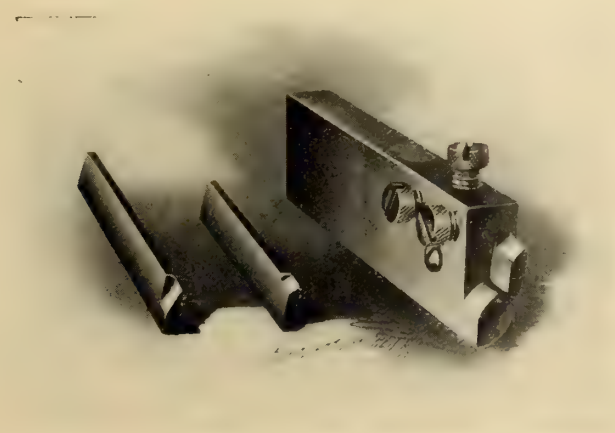

Fig. 2—No-Clearance Tool for Standard Engine Lathe Tool Post with Three Cutters of Different Angles.

The results obtained by Dr. Nicolson, which showed an increase in cutting stress for tools more acute than 60 deg., may have been due to the cuts having been run without cutting oil or suitable cutting lubricant. Furthermore, the comparative lack of durability of the more acute edge below 70 deg. may have been due either to heat or lateral quivering or both. The heat would have been greatly reduced by a liquid cooling medium, especially one having some lubricating qualities, and the lateral quivering may now be eliminated by means explained in this paper. The thin edge of an acute tool is obviously the least suited to carry off heat or to withstand the quivering incident to cutting.

This paper is intended to suggest a scheme for widening the field of investigation. Instead of approaching the subject as a scientist bent on getting exact data regarding performance of certain existing forms of tools and machines, the writer's line of approach has been from the standpoint of a designer and manufacturer of lathes, and particularly lathes of the character of the Flat Turret Lathe.

Class of Work Here Considered.

The means for cutting set forth should be considered from the standpoint of one who sees nothing but lathe work under 20 in. in diameter, and of the kind usually found in any machinery

* Paper read at New York meeting of the American Society of Mechanical Engineers.

building plant, whether it is a navy yard, railroad shop, or automobile building plant; not that the means are of no value in larger work, but being out of the writer's range of experience, such work was not considered in designing the tools described.

A more exact description of the range of work for which this tool is intended would be: lathe and turret lathe work under 20 in. and over 4 or 5 in. in diameter, and less than 8 or 10 in. in length; also work up to 2 and 3 ft. in length, of diameters under 3 to 3½ in. and generally over ¾ or 1 in.

It includes three classes of work: a, chuck work, having diameter generally exceeding length, and held wholly by a chuck or face plate; b, bar work which is held in the chuck and steadied by back rests; and, c, work having dimensions similar to bar work, but which must be turned on centre points, with or without following and fixed steady rests.

It will be noticed that this excludes all of that kind of larger and heavier lathe work in which the principal duty of the lathe is the rapid removal of the stock. In the particular branch of work under consideration the rapid removal of stock is important, but not paramount.

Although the field of work includes all kinds of steel and cast iron, this paper will deal only with the standard open hearth machinery steel of about 20 points carbon.

In work supported on centres and in chucking work, the connection between the work and tool includes a number of joints, both for sliding the tool in relation to the work, and for the rotation of the work. Each of these joints has more or less slackness, and each of the slides and other members is more or less frail in structure. With a mounting of this kind the cutting edge of the tool does not pass through the metal without swerving and flinching.

Type of Tools Used.

In the class of work under consideration each piece has several diameters, with shoulders which should be accurately spaced and formed. Nearly all the shoulders required in this class of lathe work are the so-called square shoulders.

In engine lathe practice these shoulders are "squared up" by a side tool after the other turning has been done by a round nose or diamond point tool, but in the turret lathe for bar work these shoulders are produced by the same tool that takes the stock removing cut.

The tool used in turners for bar work cuts on the same principle as the engine lathe side tool; that is, its rake or top slope is almost wholly side slope, and its cutting edge stands at an angle of 90 deg. to the axis of the work.

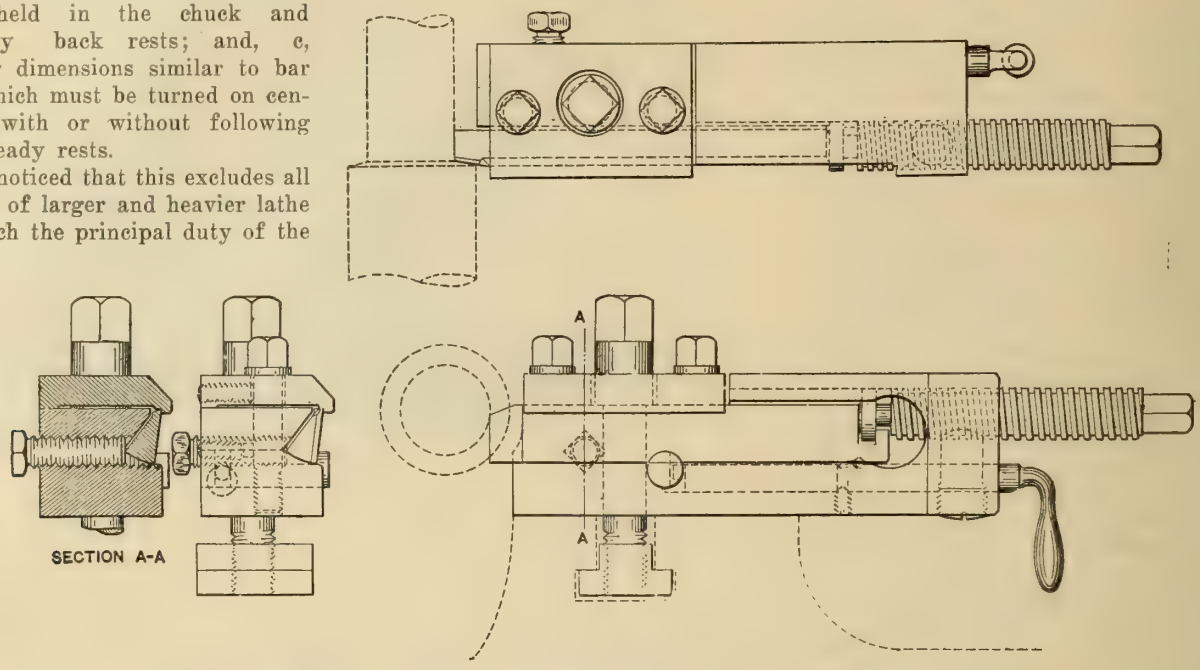

Fig. 3—Form of Turning Tool and Holder for Engine Lathe.

In the engine lathe a tool of this character has generally been unsatisfactory for rapid turning, yet in the turret lathe this very tool seems to be universally used for all bar work. The difference in performance seems to be due to the difference in mounting. It works well where there is no chance of vibration, but trouble begins when it is used in a machine like the engine lathe or turret-chucking lathe in which the work is supported by one part of the machine and the tool by another, and the true path of the cutting tool through the metal is dependent on the entire structure of the machine, there being nothing to prevent quivering.

The no-clearance tool to be described is a side tool without clearance. Its under face bears flatly against the work, thereby preventing the lateral quivering which has previously made this type of tool inefficient.

Means for Improving Efficiency.

A machine's efficiency is proportional to its strength to resist its working stresses. There are two ways to increase this efficiency; a, by strengthening the machine, and, b, by reducing the stresses for a given result.

In the writer's previous work the strengthening of the machine has been accomplished by the elimination of unnecessary features, and placing the necessary joints for obtaining the various motions in the least objectionable positions. A single-slide scheme of lathe design was adopted to eliminate the complicated and frail construction of the multi-slide tool carriage which is now in almost universal use in all standard machine tools.

The next step was to devise a means for minimizing the stresses at the cutting edge, and the object of the present paper is to explain how this result has been obtained.

This reduction of stresses may not be important in roughing work in which a flinching of the work or machine may be disregarded so long as the machine continues to crush off the metal, but for the kind of work mentioned in this paper it has been considered of first importance.

Direct Cutting Stress.

For the purpose of analysis the cutting stress may be divided into three elements: the direct cutting stress, the separating stress, and the tendency to quiver, which we will consider in turn.

By direct cutting stress we mean that part of the stress that is directly downward in a lathe. With all other conditions unchanged, we should expect to

find that an acute-edged tool would offer the least resistance, and that the difference in direct cutting stresses for tools of varying cutting angles would show a marked reduction in favor of the more acute tools.

Dr. Nicolson's experiments below 60 deg., already mentioned, showed an increase in cutting stresses and a marked loss in endurance, but these tests were on dry cutting without the benefit of a lubricant or a cooling solution. The thin edge tool is undoubtedly benefited more than the blunt edge tool by lubricant or cutting medium. Just what cutting angle would be the best under conditions of most efficient cooling medium may not yet be fully known.

That there is no marked difference in the blunter tool of varying cutting angles really does not affect the situation when we try the real cutting or sliding angles, which may be roughly stated to be efficient in proportion to their acuteness.

It is obvious that the least direct cutting stress for a given depth and feed would be obtained by a straight-edge tool, and one that would take a chip in which there is the least molecular change.

Crushing and partially or wholly shearing the chip into chunks which are three or four times the thickness of the feed undoubtedly increase the working stresses and heat.

Dr. Nicolson clearly shows the great distortion that takes place even in cutting with an acute tool of 60 deg. and a straight edge. This tool does not have even the disturbing element of shearing action at the edge of the chip, but the experiment shows the distortion of nearly every part of the chip. A tool having a round nose or a blunt edge would doubtless show still greater distortion.

A flat top slope should have a straight cutting edge. The more the edge is rounded the greater the conflict of the metal crowding to the edge. The flow of metal on the top slope of the round nose does not move in one direction wholly, but tends to travel towards the centre of the curve. The conflict of currents of metal which approach the centre from various parts of the curved cutting edge increases the direct cutting stress.

The crushing process of the present scheme of turning is due both to the bluntness of the cutting angle and the shape of the edge. A curved edge should have a curved top slope in order to remove the chip with the least distortion of the metal. The curved top slope for this purpose would make the shape of the cutting edge similar to the cutting edge of a carpenter's round-nosed chisel. This form of tool is not offered as a practical form, but is mentioned to emphasize the unnatural flow of the chip that must take place on the flat top slope of a round nose tool.

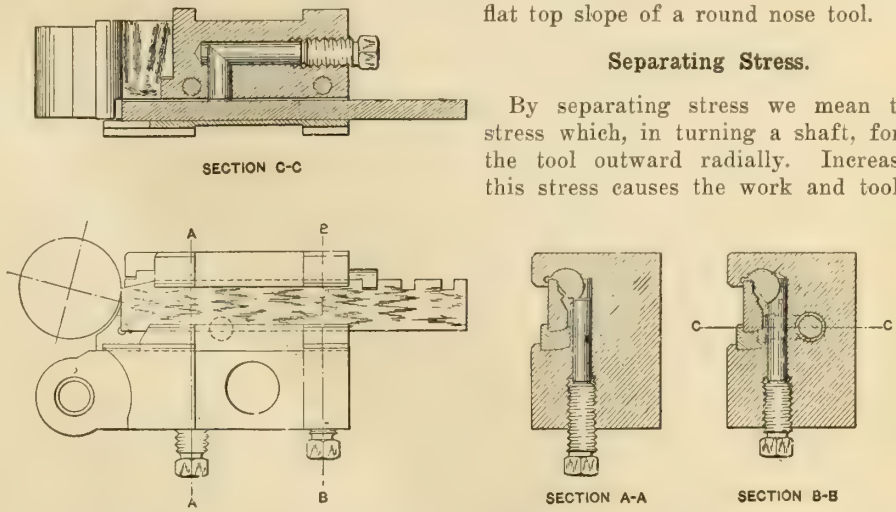

Fig. 5—Details of Turning Tool Showing Means of Holding Cutter and Limiting Oscillation.

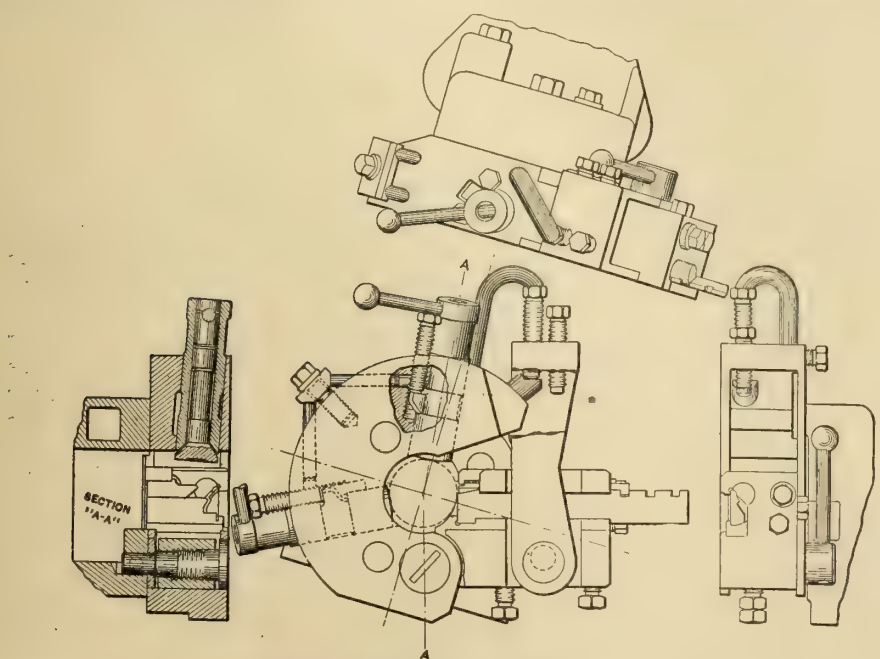

Fig. 4—Turning Tool for Flat Turret L athe.

Separating Stress.

By separating stress we mean that stress which, in turning a shaft, forces the tool outward radially. Increasing this stress causes the work and tool to move apart, and results in variation in diameter, also in irregular and generally inaccurate product, particularly when the rough stock runs eccentric or irregular. Although this separating stress may be lessened by giving the tool more back slope, this is possible only in tools taking light depth cuts. A lathe tool, however, which takes a cut like a side tool, gives little or no tendency to separate radially.

With the side tool set at an angle of 90 deg. to the travel of the feed, the feeding stress does not tend to force the work and tool apart; in fact, this tool may be set so as to produce a slightly beveled shoulder either side of the 90 deg. so as either to draw the work and tool together when making an overhanging shoulder or to force the work and tool apart when producing an external bevel.

Quivering Stress.

The quivering stress due to the nature of the chip is affected by the cutting angle of the tool. The chunks which make up the parts of a chip are less firmly united in a chip taken by a tool of 70 deg. cutting angle than by a tool 50 deg., and, of course, the more firmly united chunks, give a more continuous chip with the least vibration of stresses.

In turret lathe practice, especially in bar work, the tool and work are held together by a back rest which follows on the surface produced by the cutter, and in some kinds of turret-chucking work the tools for interior work are mounted on boring bars which take bearing

either in the work or in the chuck which holds the work. When tools get this steadying support directly on or in the work, they are freed from the chattering due to the machine mounting, but not free from that due to their own frailty or to the intermittent flow of the chip as it is taken off in chunks.

Relative Destructive Effects of Heat and Lateral Quivering.

The writer is not unmindful of the effect of heat in the destruction of the cutting edge, and fully realizes that no perfection of mounting of the work and tools will prevent destruction of the cutting edge of the tool by heat, but wishes to bring out the importance of the destructive effect of chattering which is ever present in standard types of machine tools. Heat is undoubtedly most destructive when roughing at high speeds, but the quivering plays a very important, if not the greatest part in edge destruction when finishing at the usual speeds.

Many machines are not run up to the high speed limit of the cutters. Even when provided with ample driving power, the strenuous life of attending a high speed machine is a little too much for the average man. As the speed is reduced, the quivering gains in relative importance, which should be taken into account in considering the no-clearance tool. With the slower speeds, tools should be used that give the best results at those speeds.

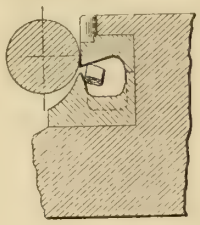
Clearance.

Since the birth of the slide rest lathe, in which the tool was first guided by mechanism, turning tools have been given clearance and it has been assumed that they would not cut without clearance. Of course it is well known that the orthodox lathe tool goes out of commission after losing its clearance, but that does not demonstrate that a tool cannot cut without clearance. It only proves that the present tools require clearance as they are now formed and mounted.

A tool which has been ground for clearance, and set in such a position that its under face is at an angle to the shoulder produced, presents but a small area to the shoulder of work when the clearance of the extreme edge has given way. The area is so small, compared with the stress of the abrading metal passing it, that it rapidly scores and wears into a rough surface standing at a "negative" clearance angle. A tool with a negative clearance and rough surface quickly goes from bad to worse.

The tool which has by chance been set in an engine lathe so that a comparative large area of the under face rides on the wall of metal does not wear away, because its surface is not subjected to as great abrading pressure per unit of area. Its area is sufficient to withstand abrasion.

It was assumed by the writer that increasing the contact of the under face of the tool against the face of the work would make it possible to cut without clearance. The advantage of a no-clearance tool is that its face rides on a good area and supports the under edge against the pressure of the chip, thus relieving the edge from the one-sided pressure which must be borne by a tool having clearance. This one-sided pressure may be wholly or only partly relieved.



No-Clearance Tool.

In order to enable the tool to ride flatly against the wall of metal from which the chip is being removed, we have mounted it to allow a comparatively free swiveling action on a centre line that is substantially coincident with the cutting edge of the tool When the tool is so mounted the pressure of the chip on the top slope tends to throw the so-called clearance face against the shoulder, for the mounting allows the tool to swing around to the angle that may be necessary to fit any work form, from a straight surface in planer work and the nearly straight surface in work of large diameter down to the angle of a helix obtained by the coarse feed on work of relatively small diameter.

A tool so mounted either swings automatically to adapt itself to angularity of feed, or may be swung by hand as soon as the cut is started. Its natural tendency holds it snugly against the metal, but the force may be varied from one that equalizes the stress on each side of the cutting edge down to a very slight stress which only holds the tool in no-clearance position. An important feature is that the tool is free to swing around to offset the unequal wear on the "clearance" face.

In the early experiments the cutters used were clamped rigidly in a holder, which in turn was pivotally mounted on a fixed holder. The cutting edge of the tool was so located as to stand exactly on the centre line of the swiveling holder.

In the later experiments the scheme has been simplified by loosely mounting the cutter itself, providing it with a round bottom struck from a centre line which is near the cutting corner of the tool. The cutting edge is usually standing at an angle to its centre line of swivel, giving the tool a front slope. The scheme of inclining the cutting edge to the line of swivel was adopted for the purpose of using a bar-shaped tool in which its shape could be maintained by grinding, for with this shape grinding back the end provides for the wearing down of the top edge. This gives the tool a front slope when the swiveling centre is kept horizontal. In some cases it may be well to tilt the holder to an angle that brings the cutting edge horizontal.

This departure from the ideal centre position of the line of swivel is not sufficient to cause any trouble. In fact, the pivotal line need not be exactly parallel to the cutting edge, neither is it necessary to have it very near the centre line of swivel. It is probable that under some conditions the cutting edge may advantageously be located either above or below or on either side of the cutting edge. The exact location of the cutting edge relative to the centre of oscillation partly determines the pres-

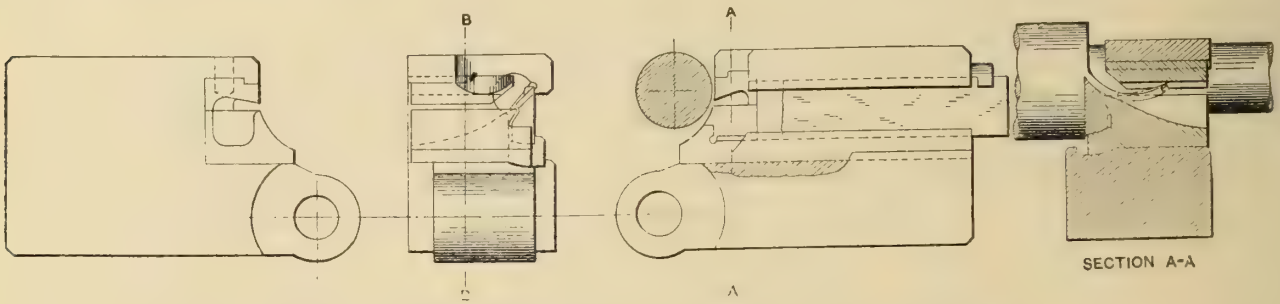


Fig. 6—Details of Turning Tool Showing Chip Breaker for a Curling Chip.

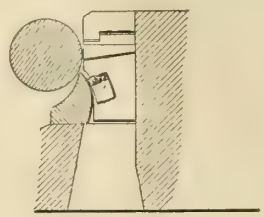
sure with which the tool rides against the wall of metal from which the chip is taken.

The extreme top edge of the tool, in some instances, has been slightly flattened on the acuter angles, the flat measuring from about 1-64 in to 1-32 in., and standing either 90 deg. from the so-called clearance face or sloping in either direction. Very good results were obtained by giving it a negative side slope standing at a maximum angle of from 10 deg. to 15 deg. from the horizontal. This top flat seems to make a good resting place for the false edge, and it may be that its successful operation is dependent on the false edge.

One interesting phase of these experiments has been the comparative willingness on the part of the tool to relieve the carriage of the duty of feeding. This first became apparent when the carriage continued to advance after the feed had been "thrown out." This self-feeding feature, of course, cannot apply to the action of planers, boring mills, or work of large diameter. It is mentioned here only to indicate the absence of resistance to the feeding motion under some conditions.

increase the tearing open or splitting effect which occurs in cutting metals. To increase the tearing action it is necessary to allow the chip, after it has passed from the edge of the tool, to pass over a lifter in the form of a wedge, either formed integrally with the tool or placed in the path of the chip near the tool, having an angle that not only assists in tearing the metal ahead of the tool, but also relieves the slope of the tool near the edge from an important part of the labor.

In other words, a chip possessing lateral strength made it possible to carry an important part of the cutting or splitting action farther away from the extreme edge. The heat generated by this part of the work, because of its



are sometimes used to illustrate ideal working conditions of a machine require the constant attention of the operator, and either a very large receptable which doubles the floor space required for the machine or the almost constant attendance of an extra man for removing the chips from the room.

The use of the more acute angles increases the chip trouble, and may in some instances make it advisable to retain the blunt cutting angles, or, at least, tools which produce tolerable chips.

For turning bar work in the turret lathe it has seemed best to adopt a chip-breaker which produces a fracture by placing an obstruction in the path of the chip at such an angle that the chip is bent, either by lifting or depressing, or both, shortly after it has left the tool, to an extent beyond its breaking point. In order to employ the chip-lifter most efficiently for the purpose of relieving the top slope of the cutting tool, the writer has preferred to use a chip-breaker which depended on depressing the chip after it passed over the chip-lifting incline. A breaker of this kind breaks

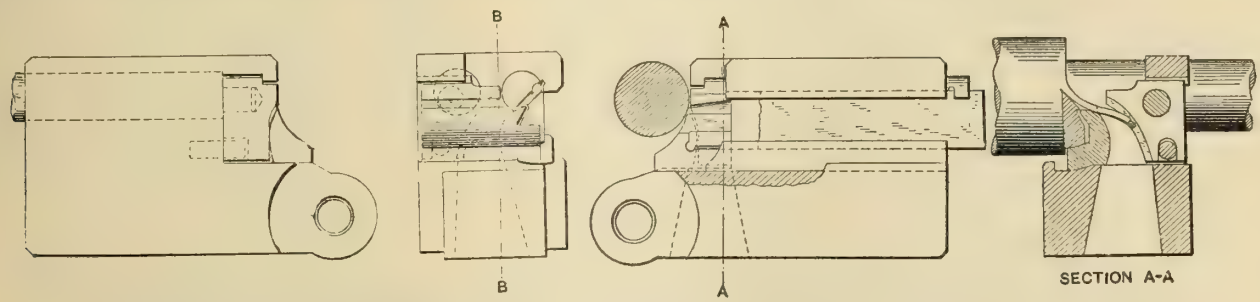


Fig. 7—Alternate Scheme for Chip Breaker for a Comparative Straight Chip.

The ultimate outcome of the use of acute angle tools may be to allow each tool to take a heavy cut on small diameters to determine its own feed. In the turret lathe this would be a distinct advantage.

Chip Lifter and Chip Control.

The chip produced by the acute angle tools is a continuous chip possessing great lateral strength. The continuous chip is preferred by any operator who has had experience with hot chips thrown off by tools of blunter angles, but while this particular feature enables him to observe the action of the tool closely without risk, the continuous chip in itself becomes troublesome, if allowed to run too long without breaking. In some of the first experiments with this tool, chips having a depth of about ⅜ in. and produced by a feed of six to the inch, were found exceedingly troublesome, especially when allowed to run out to lengths of 5 to 15 ft.

The lateral stiffness of the chip of the more acute tool made it possible to position, of course in no way reduces the life of the extreme cutting edge. Experiments with the chip-lifting scheme seem to indicate that under ideal conditions the duty of the extreme edge of the tool may be simply to cut through metal which may be under more or less of a tearing or splitting stress.

Although this chip-lifting effect may be produced by a top slope having a curved surface, it has seemed best for the convenience of grinding the tool on an ordinary wheel to keep the top slope of the cutter a flat surface, and to introduce this chip-lifter as a separate member, either as a part of the tool holder or in conjunction with the chip-breaker to be described.

Although it is, as was stated, a satisfaction to be able to stand near the cutting tool and to have some assurance of the direction in which the chip will travel, and to know that it is integral and not shooting out in hot chunks at all angles from the tool point, a continuous chip is nevertheless troublesome. Even with blunt tools, the curling chips which the chip in lengths varying from ½ to 3 in.

Conclusions.

The no-clearance cutter relieves the edge from the one-sided pressure.

It prevents lateral quivering.

It converts the lip angle into cutting angle, which for a tool of given form constitutes a gain of from 5 to 10 deg. in cutting angle.

It has extended the working range of the side tool which gives the minimum separating stress.

It has made possible the use of acute-angled tools which reduce the cutting stress, thereby increasing the output of machines which have been limited by lack of pulling power.

The reduction of the cutting and separating stresses has increased the accuracy (or output, which is generally interconvertible with accuracy) on nearly all lathe work.

This reduction also increases the output which has been limited mostly by the frailness or the slenderness of the work.

Machine Work on a Cream Separator, and Assembling Parts

Fine Work is one of the Prominent Features in Construction of Separators—Description of Work as Carried on by Petrie Manufacturing Co., Hamilton.

In the manufacture of cream separators the striking feature is the accuracy obtained in duplicating parts, especially

Fig. 1—Molding Machine Work on Cream Separator.

the gears. Machines built especially for the purpose are used in their manufacture. The plant of the Petrie Mfg. Co., Hamilton, is a modern factory for the construction of cream separators, all of the parts, with the exception of the pressed steel bowl and ball bearings being made in Canada. The bowl is machined, however, in their own works.

One of the first considerations is to construct a strong frame with a solid foundation. This is necessary in this fast-running machine to reduce vibration to a minimum. The cast iron parts are all molded on Pridmore machines, a view of one being shown in Fig. 1. Fig. 2 is the magnet separator showing the construction.

In the frame, properly encased, is the spur or square gear shown in Fig. 2. It is the system found to work well for fast-running machines. The points of contact between the spur gears are direct, producing a rolling motion. A larger view of the ball race is shown in Fig. 3. This arrangement consists of a ball in the bottom of the ball race cup, around which five balls run. The spindle that rests on these balls has a hardened steel ball for its point. If this ball should become slightly worn in one place by inserting a nail in the drilled hole shown the ball can be revolved and a new surface subjected to wear.

In tracing the work through the machine department the first operation is boring the frames in jigs carefully made by Brown & Sharpe. These are so constructed that a frame that does not fit either jig is thrown out. In boring the same high speed drills have been in use for three years, and there has been an output of fifty per day. The boring, milling and drilling department is shown in Fig. 4.

In the power presses, Fig. 5, the skimmers and other tin parts are shaped from steel and riveted by compressed air. The skimmers and the steel bowls are tinned so that there is no chance of rusting. In tinning these go through a process of caustic, water, sulphuric acid, muriatic acid and hot zinc. Four sizes of separators are obtained with the one size frame by changing the skimmer and bowl.

The gears are cut on Fellows' gear

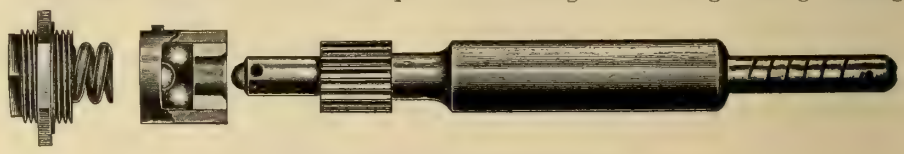

Fig. 3—Spindle and Ball Race.

Fig. 4—Boring, Milling and Drilling Department.

shaper, and two Brown & Sharpe's. The work is done with great accuracy as the gears run at 7,500 revolutions per minute. In Fig. 6 is shown the automatic gear-cutting machinery. A D. E. Whinton bevel gear cutter forms part of the equipment. The gears must be accurate from the first. They cannot be worn into shape, therefore the measurements must be exact.

Five Cleveland automatic, three Potter & Johnson, Pawtucket, automatic turret lathes, and six Jones & Lamson, Springfield, turret lathes, shown in Fig. 6, are used for small parts, and there is practically no variation in these parts. The machines are all built on concrete foundations and are rigid in construction. The gears are ground all over on two Landis grinders, with wheels furnished by the Canadian Corundum Co., running at 3,500 revolutions per minute. These wheels are soft and are used both for steel and brass.

The bowl is pressed in a large press costing about $14,000. The whole equipment for manufacturing separators is expensive, and for the manufacture of 50 per day a capital of $360,000 has been invested. It is the intention of the Petrie Mfg. Co. to instal one of these presses at a future date to manufacture the made in Canada separator.

The bowl of the separator is made of seamless steel tubing. In machining it, it is chucked and bored inside. It is then chucked on an expanding arbor and finished outside before it is removed from the lathe. By this method a well-balanced bowl is turned out.

In the assembling of the separator all parts are tested and the separator is run at full speed for some time. One feature is the unique patented brake. This is a strip of steel encircling the bowl and stops the machine very quickly with a very small pressure. This is a very effective brake and makes the equipment of the cream separator complete.

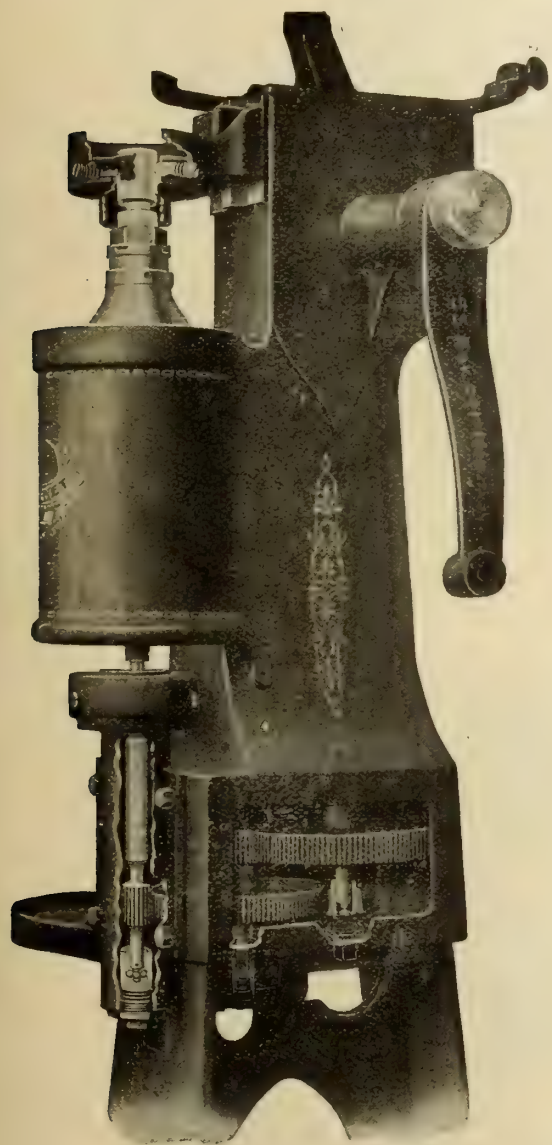

Fig. 2—Magnet Separator.

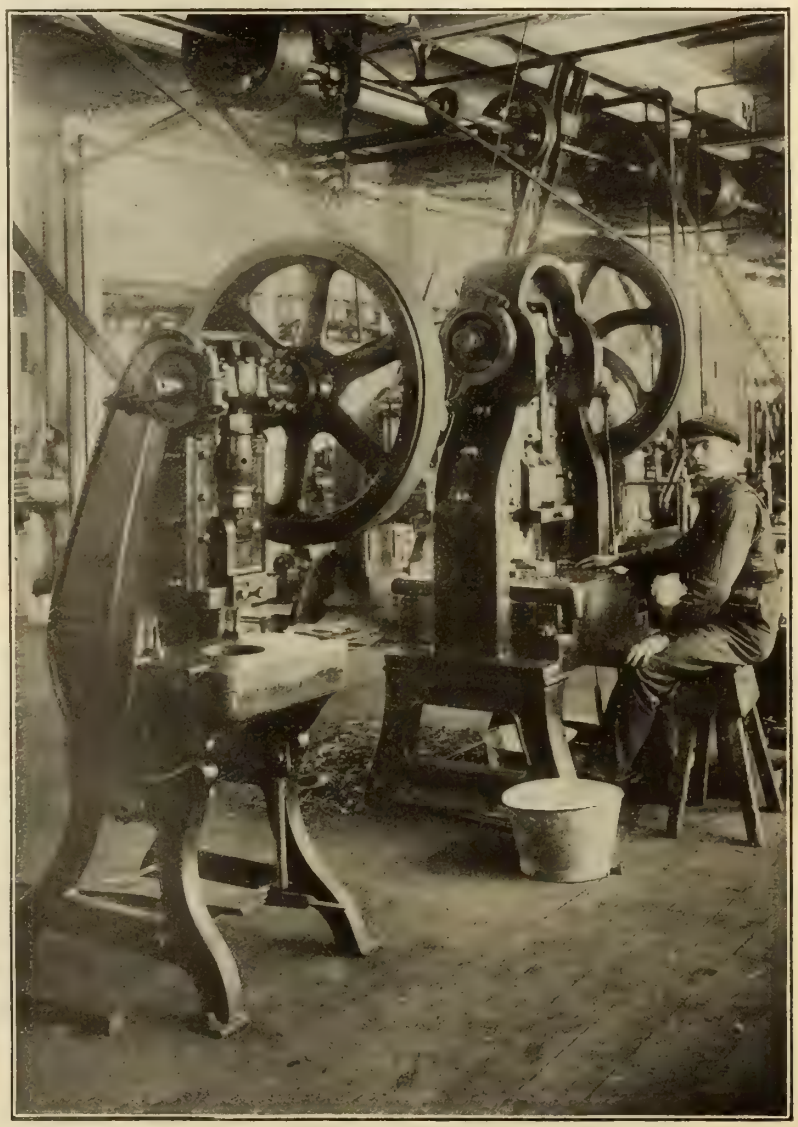

Fig. 5—Power Press Department.

WATER POWER.

The value of a developed water power is stated by Chas. T. Main, mill engineer and architect, of Boston, to be as follows:

"If the power can be run cheaper than steam, the value is that of the power, plus the cost of plant, less depreciation. If it cannot be run as cheaply as steam, considering its cost, etc., the value of the power itself is nothing, but the value of the plant is such a sum as could be paid for it new, which would bring the total cost of running down to the cost of steam power, less depreciation. That is, it is worth just what can be gotten out of the plant and no more."

Accurate Cost Keeping as an Aid in Manufacturing

First Article of a Series on Cost Keeping, Illustrating from the System Now Used by the Canadian Locomotive Co., Kingston, Treating of the Necessity of Securing Accurate Cost Data and General Scheme Followed.

It doesn't seem necessary to argue the need of accurate cost-keeping. Every manufacturer should know the advantage of the cost department. In a complete system there are several branches usually divided into the heads, labor, material and overhead charges. To look after the cost of these are several clerks, a cost clerk, timekeeper and a store's clerk or stockkeeper, and in many establishments where the superintendent cannot attend to the buying, the office of buyer is added. In industries, where great quantities of a line of goods are manufactured the office of shipper is also added. In a locomotive works where two locomotives are shipped per week this office is not necessary, as it requires the attention of one clerk for only a few hours a week.

The general scheme followed by the Canadian Locomotive Works may be applied to any industry but in detail there are very many differences. In an agricultural works, for instance, there would be nothing gained by going into the detail necessary in a locomotive works, yet a complete system is required in both cases.

Time Keeping.

It is an easy matter to obtain the total number of hours worked during the day by a mechanic, but is more difficult to properly distribute the time on the various jobs on which a man may work during the day. In the early days it was customary for a foreman to carry a book in his pocket, containing a list of his men. Each day he marked the time a man worked opposite the man's name. For his information he had to depend a great deal on a man's honesty.

The next step in the development was to have a time clerk supplied with a large book, in which the time of a mechanic's entrance and exit were marked. It was then found necessary to have one door for the entrance and exit. In this manner the time-keeping department developed and with it the cost-keeping.

Object of Cost-Keeping.

The object of a good cost system is to do away with any off-hand estimates, to collect accurate data in regard to manufacturing operations and compare them with previous similar work. In this way the benefit of the system will be seen, an increased output may be obtained at a decreased cost. If a business has been unprofitable, the leaks may be discovered and eliminated. Another point is that increased business may be secured by judiciously lowering the selling price of the product.

The system should give within a reasonable time after the work is done, the actual and complete costs including every item of expense, the cost of each operation on each part of a machine and cost of erecting it. It should assist in the economical purchase of materials and obtain greater efficiency from the workmen by providing remuneration, through a cost or premium system for special individual work.

An illustration shows the efficiency and rapidity of finding costs with the system in use at the Canadian Locomotive Works. An hydraulic riveter was installed in the boiler department under contract. Mechanics from the Locomotive Works were employed in the erection and some material was used. The cost of this labor and material was to be deducted from the cost of the riveter. The work was finished one afternoon. The man in charge of the instalation entered the office and reported his work completed. He also said he would return in about two weeks when the company would have the counter account prepared and adjust the charges. He was told to come back in the morning before noon, which he did, and was surprised to find all the charges, both for labor and material, prepared. This was done in the regular course of working of the cost system. The man objected to some charges, but they were shown to be correct and the riveter was accepted. Had the matter stood for two weeks the differences might not have been so quickly and easily settled.

Unfortunately, some managers of works look upon a cost system as an added expense, overlooking the many benefits. By means of a cost system, if one department shows a loss, that particular department can be investigated and steps taken to trace and correct the cause. This is possible by comparing costs month by month, or, in case of locomotive works, the cost of one locomotive against another. This is possible, as locomotives are usually constructed in groups of five or ten under a contract number.

The system must be complete, yet simple, giving full information in regard to stock, etc., a system which shows any defect and its cause, and the quantity and quality of the work in the various departments. A manufacturer can then tell exactly how he stands, whether or not he will have a profit. Everything must be accounted for and the details of the business, coming to the direct notice of the superintendent, he is better able to keep the efficiency of the works to the highest point.

The Accounting.

The Canadian Locomotive Co.'s plant consists of offices, including the engineering department, pattern and carpenter shop, foundry, machine shops, forge shop, boiler shop, erecting shop and power plant. When an order comes for a number of locomotives the specifications and drawings are prepared in the engineering department. A copy of the specifications is sent to the stockkeeper who knows what material is on hand. The buyer is notified and he orders the material to fill the contract. If the prices are low, he buys a large stock of pig iron, bar iron and steel, etc., and if prices are high he orders only enough to complete the contract. The work then passes through the shops and the labor and material costs are carefully kept.

The total cost includes productive and non-productive labor, power, material, tools, depreciation, general office expenses, etc.

Productive labor includes all men employed in the actual work of production, machine men, fitters, erecting men, etc. Non-productive labor includes superintendents, foremen, timekeepers, errand boys, clerks, watchmen and laborers.

In the general office the expenses that must be taken into consideration are insurance, salaries, light, supplies, heat, telephone, taxes, etc. Other expenses are power, shop transmission, material and depreciation.

Shops occupying their own grounds and buildings are their own landlords and must furnish themselves with power, elevator service, watchmen, etc. The shop must pay real estate taxes unless they receive exemption from taxation, but, in any case, there will be school

taxes, water, insurance on buildings, repairs, power and heat.

In many towns plants receive exemption from real estate tax with the exception of the school tax for employing a certain number of men and paying out annually at least a certain fixed amount in wages. In some cases taxation is fixed and in this case the amount, depending, of course, on the rates of taxation, is added each year to the general expense.

The rate of insurance is a very variable one and depends on the quality and arrangement of the buildings, the contents, fire protection and watchmen's service. It is a good thing to have the building installed with automatic sprinklers. With a good fire service, the rates are much lower. It is better to expend the money in a good fire service than in heavy insurance rates.

There is nothing about the shop that will withstand the wear and tear, but everything must wear out. No matter how good a machine may be when placed in the shop, there comes a time when it is so useless that it does not deserve shop room. It is relegated to the scrap pile and is replaced by a new machine. Under different conditions, different lengths of time will be required to wear out the machine, but the end of the machine must come and the machine be replaced by one more modern and useful. The cost of the new machine cannot be changed to the particular year in which the change is made, nor can the plant be figured at its full cost value each year. What is done is this. The life of a machine is taken and its cost divided up into as many parts as there are years in the life of the machine. One of these parts is added each year, to the expenses of operating. Each of these parts is called a depreciation. The average life of a plant is from ten to twenty years, so that one-tenth to one-twentieth of the cost of the plant must be added to the running expenses each year.

Interest is the price paid for the use of money and discount means much the same thing. In the first case, when a manufacturer borrows money from a bank or from people who make a business of renting or loaning money, he must pay a good round sum for the use of it. There are few manufacturers who do not require ready money and as products are usually sold on thirty or sixty days' time or in the case of agricultural implements, six months' time, there are people who take advantage of these facts to offer to pay cash if allowed a certain percentage discount. These items must, therefore, be reckoned in figuring out the cost and added to the percentage allowed for general expenses.

Every manufacturing establishment requires a large amount of printed matter and to this should be added the cost of photographing, designing and preparing engravings and cuts. There is the cost of publishing catalogues and circulars and in addition there are used in large quantities, letter paper, envelopes, receipts, forms for the different departments, including the cost department, various books, pens, ink, blank paper, all of which add to the cost, although some items will be rather small.

In the case of oils and lubricants there are two costs to consider, the cost of the oil and the cost of the power to overcome friction. Now it is manifest that the latter is much the greater and that the cost of the oil is almost incomparable with the latter. Yet some manufacturers will save $1 in buying a cheap oil only to spend $100 in overcoming friction which might be easily overcome by replacing a good for an inferior oil. An extra dollar spent in lubricating the bearings with a good oil is money well invested, and often affects an appreciable saving in power, and, therefore, in the cost of manufacturing.

General expense accounts should be made up at stated periods, and added as a percentage of the productive labor. The cost of maintaining the engineering department and all non-productive labor is calculated in the same way.

A complete system of cards is in use in the Canadian Locomotive Works. It has many advantages over the book system. It is a system of rapid compilation. There is no lost time. If a superintendent wishes to examine the cost of any part, he can do so without stopping the cost-clerk's work. A premium system of rewarding men is also in use. Twelve clerks are employed in the carrying out of the time and cost system. Among the duties are to keep a record of all present and past employes, weight of castings, etc., and the cost department is, in reality, the superintendent's information bureau.

In the February issue will be described the Time-Keeping System, used by the Canadian Locomotive Co.; in March, the Paying System, and in April, the Material Cost and Summary. The forms used will also be given.

SHERARDIZING PRACTICE.*

By J. Everett Thompson.

Some data may now be of interest derived from experience with Sherardizing in the United States. As a method of rust proofing, Sherardizing is an excellent one. It is applicable in all cases where hot or cold galvanizing can be used.

The great importance of Sherardizing consists in the fact that in addition to a surface coating of zinc, an infinitesimal quantity of zinc is alloyed into the iron or steel and forms in itself a rust proofing that resists corrosion.

In many cases the articles need no special cleaning before being Sherardized. In others they are cleaned, as is done for ordinary galvanizing. Bolts, nuts, screws, stampings, bright plates, wire goods, etc., may be Sherardized just as they come from the machines without any further preparation or cleaning. Articles coated with grease or oil receive as good a coating of zinc as those which are free from it, if not better.

The Method.

The articles to be Sherardized are packed in a closed drum or bar in contact with the ordinary zinc of commerce. The drum is placed in an oven and heated to a temperature of about 700 degrees F. for 4 or 5 hours. It is then withdrawn and allowed to cool down to a temperature convenient for handling, when its contents are dumped upon a screen or grating which allows the zinc dust to fall through into a chamber below, from which it is drawn for use again. The cycle of operation is so simple that the most ordinary class of unskilled labor can be employed without fear as to the results.

Advantages.

By the gradual heating up, and then the gradual cooling down, the zinc dust being a poor conductor of heat, there can be no sudden high temperature. The extreme evenness of the coating in practice means that, however thick it may be, the sharpness of screw threads or the shape of stamped letters is preserved, and if sufficient clearance has been given, a Sherardized nut will run on a Sherardized bolt as easily and as smoothly as if it were not Sherardized, no recutting being required. Articles Sherardized and buffed may be used instead of polished brass or nickel plating. Since the protective coating is in the surface and not on it, it does not peel off as plating does. Sherardized plumbers' supplies are unequaled as to beauty of finish and length of life. In marine construction Sherardized metal ranks next to solid copper and brass in its ability to withstand corrosion. Chains treated with this process have remained in sea water continuously for nine months without showing any signs of corrosion.

It is hard to tell which is the more worthless: knowledge without energy, or energy without knowledge. Neither an engine without a train nor a train without an engine is making any money for the company.

* Articles on Galvanizing and Sherardizing appeared in January, August and October, 1908.

Co-operative Technical Education, with Examples*

The Need of Industrial Education for Mechanics in Manufacturing Centres in Canada—An Outline of Apprenticeship System of the Bullard Machine Tool Company, Bridgeport — The Co-operative System at Bridgeport.

The question has been asked, Why are Canadian mechanics so backward in acquiring technical education pertaining to their work? The reason is simply because the attention due this important subject has not been given to it by the Canadian Governments.

In Massachusetts a bill is now before the Legislature to establish an industrial college. The plan proposed by this Legislature includes extensive buildings, most modern shops, laboratories and other equipment, and a corps of instructors sufficient in number to train a large student body. The idea is to place the institution between the engineering school and local technical or trade schools. The students would be equipped to become superintendents and high-class foremen.

This system may work out all right, but it isn't what Canada requires at the present time. Canada is a growing country and education cannot be centered in one or two or three cities. The tendency in the case cited will be to raise the standard until the school is on a par with engineering colleges and Canada has sufficient engineering colleges at present.

The manufacturing centres of Canada are in urgent need of technical schools. Massachusetts has just enacted a law providing aid for free industrial schools, establishing the right of a resident of any city or town in the State to attend an industrial school located in any other community and compels his residential city or town to pay his tuition fee. This wholly logical provision is designed to meet the wants of the young people of places so small as to be unable to support schools of this character. It is intended as a factor in the plan of dividing the State into districts, each with its industrial school supported in part by the State. This is a plan worthy of being followed by Canada.

The principle of Government aid for schools of this character is an excellent one. Their benefits are far from local to the places where they are situated. The students go out into the world to use the results of their training wherever it will reap them the most benefit. Technical education is an essential part of the foundation of a country's future industrial welfare. Germany has recognized it and United States has done much and is doing much to establish industrial schools for mechanics.

Apprenticeship Systems.

Much can be done for apprentices while they are apprentices. E. P. Bullard, jr., president of the Bullard Machine Tool Co., gave a paper on "Industrial Training Through the Apprenticeship System," at the Atlanta convention of the National Society for the Promotion of Industrial Education, showing the many good points of proper apprenticeship systems.

Mr. Bullard combatted the idea that the apprenticeship system is dead, and stated his belief that no system of schools could completely take the place of shop training. He outlined a careful inquiry which he had caused to be made at the works of the Bullard Machine Tool Company into the comparative cost of the same pieces of work when done by journeymen and apprentices, the cost of 1,000 such pieces having been collected by the cost-accounting department. These had been analyzed and compared with the addition of the proper burden figured on the hourly burden plan, and the work of the apprentices had been found to be appreciably cheaper than that of the journeymen. This inquiry had been undertaken because the directors of his company did not believe apprentice labor to be profitable, or that the works could afford to employ apprentices, and the result of the investigation has been to change this belief.

He considered it necessary that the apprentice should be paid sufficient wages to provide for his support, that he should be given instruction in the technique of his trade, that an adequate amount of class room instruction should be provided aiming directly at the work of the shop, and that especially the apprentice should be taught the care of expensive factory equipment. The foremen should not be relied upon to teach apprentices, but a special shop instructor should be employed, as foremen have too many responsibilities and cares to make it possible for them to teach the apprentices.

Speaking of care of factory equipment, he stated his belief that 90 per cent. of the repairs required for metal-working machinery are due to the negligence and ignorance of their operators.

The apprenticeship system of the National Association of Machine Tool Builders is in use in the Bullard works. The terms of the regular apprenticeship, diploma and list of tools given to apprentices are here given.

Terms of Regular Apprenticeship.

TO

.....

OF

.....

MANUFACTURERS OF MACHINE TOOLS

And Member of the National Machine Tool Builders' Association.

1. Application must be made in person. When satisfactory, the applicant's name will be registered and due notice given when he is required to commence work. Applicant must be at least seventeen years of ago.

2. The applicant must, before commencing work, execute together with some responsible surety an agreement in the form hereto annexed.

3. A trial period of one thousand hours will first be required, after which, should the apprentice prove satisfactory, he will begin his term of service which will be three years of 2,900 hours each.

4. If during this period of trial an apprentice should, in the opinion of said company, prove deficient in capacity or unsatisfactory in deportment, notice to that effect shall be given to said apprentice and his surety and the contract of apprenticeship shall become absolutely void.

5. On completion of the trial period, the apprentice will be given the use of a new equipment of tools, which will be the property of the company; but on satisfactory completion of the term of apprenticeship, said equipment of tools will be given to the apprentice free of charge.

6. The wages of apprentices shall be as follows: For the first one thousand hours, or period of trial, and the first year, eight cents per hour; for the second and third years thereafter, ten and thirteen cents per hour, respectively, will be paid.

7. Wages will be paid on the regular pay days of the company as they may, from time to time, be established, except that the money earned during the trial period will be retained by the company until the apprentice shall have completed his term of service, when he will be paid that amount, unless it shall be forfeited as otherwise herein provided.

8. Lost time shall be made up at the expiration of each year, at the rate of wages paid during the said year, and no year of service shall commence till after all time lost by the apprentice in the preceeding year shall have been fully made up.

9. It is also expressly understood and agreed that at any time when from any cause whatsoever, orders shall fall off, making it necessary to shorten the hours of labor or close the

* In March, 1908, appeared the G.T.R. Apprenticeship System; November, 1908, Industrial Course at Fitchburg; December, 1908, Urgent Necessity of Technical Education in Canada.

works or department, the said company reserves the right to suspend the force of apprentices wholly or in part, making payment only for the time actually worked.

10. The company will faithfully instruct the apprentice in the Machinist's Art or Trade in their shop, in ..... during his said term of apprenticeship.

11. Applicants who may have served terms of special apprenticeship, or who may be graduates of Technical Schools, shall be entitled to such credit of time on period of service as regular apprentices, and an increase in wage rates, as may be mutually agreed upon.

12. Apprentices will be required to perform their duties with punctuality, fidelity, and diligence, and to conform to the rules and regulations which are or may be adopted from time to time for the good government of the shop; and the company reserves to itself the right, at its sole discretion, to terminate the agreement and discharge an apprentice from further service, for any unfaithfulness, non-conformity with such rules and regulations, want of diligence to his business, or improper conduct in or out of the shop. In case of such discharge, or in the event that said apprentice shall abandon his apprenticeship before the expiration thereof, without the consent of said company, the apprentice shall forfeit all wages then earned and unpaid, together with the money earned during the period of trial, retained by the company as a guarantee of good faith.

DIPLOMA.

This is to Certify that ..... has served full term of Apprenticeship in acquiring the Art or Trade of Machinist, and is fully instructed in all branches of said Art or Trade at the works of .....

In witness whereof we hereunto set our hands and the seal of the National Machine Tool Builders' Association, this ..... day of ..... 19.....

..... President.

(Seal)

..... Secretary.

Tools Given to Regular Apprentices.

12 in. Surface Gauge, No. 57, 3½ in. base.
12 in. Combination Square Set, No. 23, with centre head.
1 lb. Hammer.
12 in. Scale No. 2 graduations.
6 in. Scale No. 4 graduations.
4 in. Scale No. 4 graduations.
10 in. Monkey wrench.
6 in. Stiff Joint Caliper, outside and inside.
9 in. Stiff Joint Caliper, outside and inside.
1 in. Micrometer.
6 in. Divider.
6 in. Hermaphrodite.
2 in. Centre Punch, large and small.

Necessary tools not included in the above equipment will be supplied from the shop tool room, on foreman's order.

During the fall of 1908 an innovation has been made in Bridgeport. Many of the most important manufacturers in this city have, working in co-operation with the local Y.M.C.A., established a day school in the Y.M.C.A. building under the supervision of a special instructor, and are sending their apprentice boys for two hours a day, five days a week, to the class room to receive instruction in the branches of study allied to the machinist trade, such as arithmetic, etc.

These boys are paid for the time they are in the class room, and through their increased knowledge they will be able to repay the employer by their increased earning capacity.

The school was started at the instance of Mr. Jeremiah Holmes, industrial secretary for the Y.M.C.A., working in conjunction with the Industrial Education Committee from the Manufacturers' Association. Mr. Broadhead, a graduate of Lehigh University, and until recently an employe of the Bethlehem Steel Co., was engaged as instructor.

The expense of maintaining the school is defrayed by the tuition received from the students, which is in all cases paid by the manufacturer who sends the boy to the school. The boys are all apprentices working in factories throughout the city.

Mr. Broadhead has placed the boys in classes according to their ability. The manufacturer is furnished with a report giving the progress the boy is making in school. No boys were given this opportunity who had not at least two more years to serve on their apprenticeship contract.

Details of Work.

Apprentices will pursue their shop work as at present in the factories where they are under contract. The class room work is given in the Y.M.C.A. building, to which the students proceed for a two-hour period for either three or five days a week as the manufacturer may elect. These two-hour periods may be assigned to commence or terminate with the regular hours of work at the factory. This affords a minimum of lost time in going to or from classes.

The classes will be in charge of competent instructors especially qualified, and engaged solely for this work. Owing to the lateness of the season, it has become necessary to limit the course for the first year to 30 weeks. In view of the somewhat short season, it is obvious that the five-day plan is desirable, if not essential, to a fair test of the system during the first year. The shop work is assigned to the charge of a capable employe already on the factory pay roll, who supervises the work of the apprentices under his care, and familiarizes himself with the general lines which the instruction follows.

The cost to the manufacturer will be a natural charge for the development of apprentices. At Lynn, where the General Electric has successfully used this same system, this has turned out to be —in dollars and cents—one of the most profitable departments of the works, as the increased value of the apprentice from day to day as an employe in the manufacturing departments much more than offsets the expense. The instruction expenses are divided among those making use of the system, and for the first year the charge is approximately $20 or $30 per apprentice, according as the three or five-day-per-week sessions are used.

This co-operative system is practically identical with that developed by M. W. Alexander, at the General Electric Works, West Lynn, Mass., with great success. At West Lynn, over $200,000 have been spent in buildings and equipment. By making arrangements with the Y.M.C.A. the manufacturers of Bridgeport have eliminated this expense. Later on, however, it is hoped that the Board of Education will be in a position to establish a separate institution for this work.

The apprentices at the General Electric Works, receive $5 a week, being paid for the hours spent in study as well as the time spent in the shop. The class room work forms the keystone of the successful performance of the system and is given in a central building over a mile distant from portions of the plant. The two-hour periods at West Lynn commence or terminate the day's work as assigned and afford a minimum of lost time.

The February issue will contain further comments on, and other examples of, technical educational courses for mechanics. It will also review the conditions that exist in some shops and show how they may be eliminated by establishing courses in technical education.

INCREASED RESPONSIBILITY.

Uncle—"What's that, my lad? you tell me your employer has forced an interest in his business upon you, and you only with him six months?"

Nephew—"Yes, sir; he said if I didn't take an interest in the business, I'd have to get out."

AN UNUSUAL TYPE OF DREDGE.

This article on page 38 of December issue, 1908, Canadian Machinery, was contributed by George Johnson, Arnprior, who designed it.

A NEW JOINTING CEMENT.

A new cement, Hawkins' "Imperishable," is being put on the market by Bain & Mitchell, Montreal. The application is simply made by mixing the cement to a stiff putty with a little boiled oil. Corrugated rings are not needed and no hammering or chipping is required to bring pipes apart after use. Pressure can be immediately turned on in any pipe line, etc., as soon as cement is in place, and flanges screwed tight. The cement is put up in tins in four sizes, viz., 14, 28, 56 and 112 pounds.

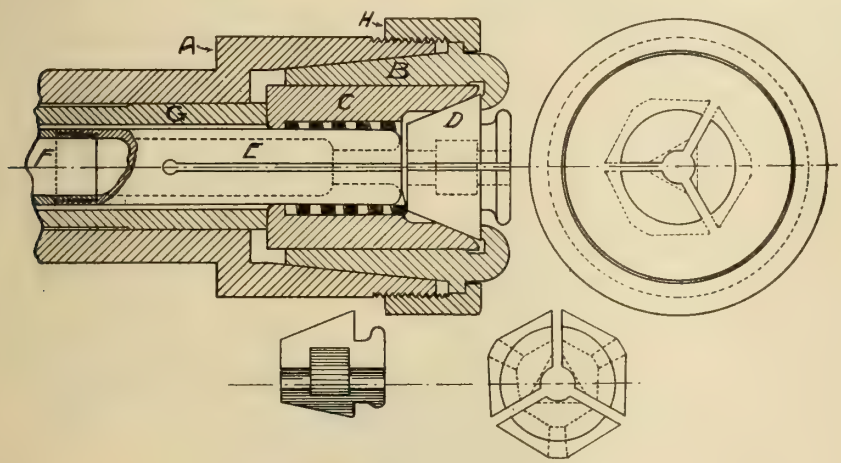
NEW SCREW MACHINE COLLET.

By D. F. Kalish.

The sketch shows the front end of the spindle, the rear end being the same as the ordinary screw machine spindle and is not necessary for this description.

"A" is the spindle and the front end, only, is hardened and ground inside and outside. The hole being made taper to insure a good fit of the piece "B" without much fitting.

"D" is the collet, tool steel and is made up of three pieces, as shown in the detail, and requires no grinding. The hole is reamed .005 smaller than the size of the stock to be held. It is finished turned from the hole and is then gripped endwise in the milling machine vise and slotted clear through. The hole is relieved in the middle of the collet by filing straight across as shown in the detail. The taper part is relieved as also shown in the detail, leaving a bearing about one-eighth of an inch wide on each section of the collet, giving a narrow bearing which enables the collet to hold smaller sizes than the size for which the collet was originally made.



Screw Machine Spindle.

"C" is the closer and is made of tool steel, hardened and ground inside and outside. The point where it bears on the collet should be as far forward as possible so that the collet will have a good hold when the stock gets near the end of the bar.

"E" is the feed chuck and the hole is made about .005 larger than the stock and is tapped in the rear end for the feed tube, instead of the thread being cut on the outside, making the piece simpler to make as it then can be turned one size on the outside.

"F" is the feed tube, which is made the same as the ordinary feed tube in most screw machine spindles, excepting that the front end is turned down and threaded.

"G" is the push tube and should have a good bearing on both ends to enable it to butt straight up against piece "C."

"H" is the spindle cap, machine steel which holds piece "B" back to its proper seat in the spindle and has holes (not shown) for screwing up with a spanner wrench.

New bars of stock may be put into the machine without stopping it and stock can be used right down to the end, saving considerable waste. Just before feeding, the push tube "G" recedes and the spring forces the closer "C" back. Centrifugal force then opens the collet and it stays open until push tube "G" is moved forward. The spring keeps the collet straightened up against the piece "B" at all times and the piece "C" when moved forward forces the collet to close down upon the work.

The spring was made of rectangular section on account of the small space which was available between the feed chuck and the closer.

There was no trouble from small chips working back into the slots, the oil flying off the rim of the collet carrying the small chips off with it.

The fact that the collet is always held in a forward position by the spring there is no end variation in the pieces being made, as caused by the movable collet in the ordinary style.

Several spindles designed and built this way have given excellent satisfaction as to the accuracy of the product and its advantages as to ease of making and superiority over the old style are obvious by the drawing and description.

PRACTICAL HINTS ON TOOL STEEL

By Wm. M. Preston.

This article is intended to treat on the practical and every-day methods of working tool steel in a plain and simple manner. It is comparatively easy to secure good results from plants especially made; where expensive registering instruments record the various degrees of heat required. Concerns with these facilities, however, are the exception, and not the rule. Therefore, these hints are intended for the average Canadian workshop, where only the ordinary facilities are found.

One of the most essential points to be remembered is, that steel is extremely sensitive to heat, and while it is in a heated state, great care should be taken that the heat either increases or decreases in an uniform manner. The former applies to hardening and latter to annealing.

It is an undisputed fact that those who have to do with steel have trouble in a greater or lesser degree. Chiefly in the greater degree.

Some mechanics expect to loose a small per cent. of a batch of tools in hardening. Does it seem unreasonable to expect that a batch of tools be put through the hardening process without any losses whatever? If ninety out of one hundred can be put through successfully in this way why not the remaining ten pieces? It is safe to reason that if the conditions are favorable for 90 per cent. the other 10 per cent. can also be done in the same manner if care be taken. Therefore there are mechanics who work daily on steel, who do not lose one piece out of 1,000, either by over-heating or cracking.

In some instances it is very natural to expect losses. Small shops usually have one or more smiths who do the forging, welding and various other kind of work. To expect a smith who has but recently made a weld, to harden a tool and not spoil it, is unreasonable.

To avoid losses along these lines, a man must not be permitted to weld, if he is to harden. The welding heat is so intense that it destroys the faculty of the eyes to rightly distinguish a proper heat for hardening, and, therefore, heats taken under these conditions are usually too high which destroys the steel, even though it may not crack or warp.

Steel manufacturers are unanimous on this point; or more properly speaking, on this rule. "Best results are obtained by hardening at the lowest possible heat at which steel will become hard." Facilities for heating have a great deal to do with the success or failure to secure results. However, with even the ordinary forge, the most gratifying results may be obtained, if a little care and judgment is exercised.

With a few fire bricks at hand, the ordinary forge may be quickly converted into a temporary hardening oven. The bricks may be built up loosely into a rectangular form, large enough to accommodate the work at hand. After an ample pit has been allowed for the fire, place a fire-clay slab or cast iron plate over same, so that the work does not come in contact with the fire. Then build up one or two bricks higher for oven in which to place the work. By covering the top over, and closing the front as much as possible, the job is complete. Fine coke, or nut coal is more adapted for firing than forge coal, as they are cleaner and last much longer.

Large and ample fires are very essential, so that the heating may be done with a minimum blast. This insures even and uniform heats and avoids overheating.

The hardening bath should be of liberal proportions. Not too small. This does not necessarily need to be composed of some secretly prepared solutions. A good strong salt brine is equal almost to any solution known. Of course for difficult shapes and irregular small pieces, oil is preferable.

It might also be well to note that good results are not obtained by "plunging" heated tools into the bath. Care should be taken to immerse the tools slowly into the solution. The way a piece is immersed usually determines whether it shall be warped or straight when it is cooled.

Hardening solutions should be kept absolutely free from oil and grease, and ought to be securely covered when not in use.

Tempering the same as a great many other theories and practices has been revised somewhat in recent years. Many and varied are the methods used. But for all ordinary purposes, the old method of drawing the temper to color is a very satisfactory and simple way of securing good temper in tools. On articles which have a rough surface, the color is harder to distinguish than on articles that have a smooth or polished surface.

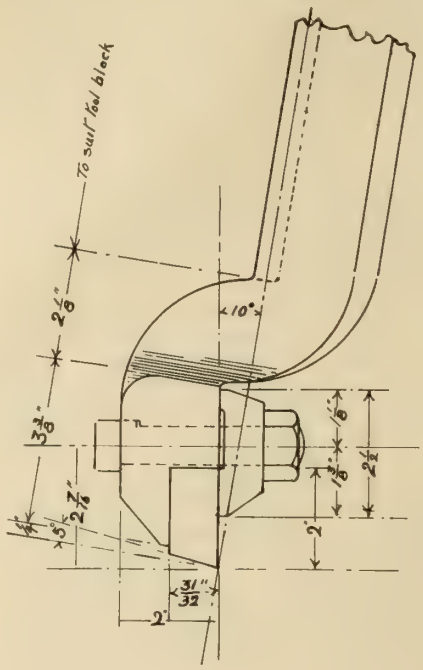
Good tempers are secured by slow uniform heating. When the desired color is obtained the piece may be immersed in oil for about 5 or 10 seconds, and then withdrawn, to be cooled off in the air.

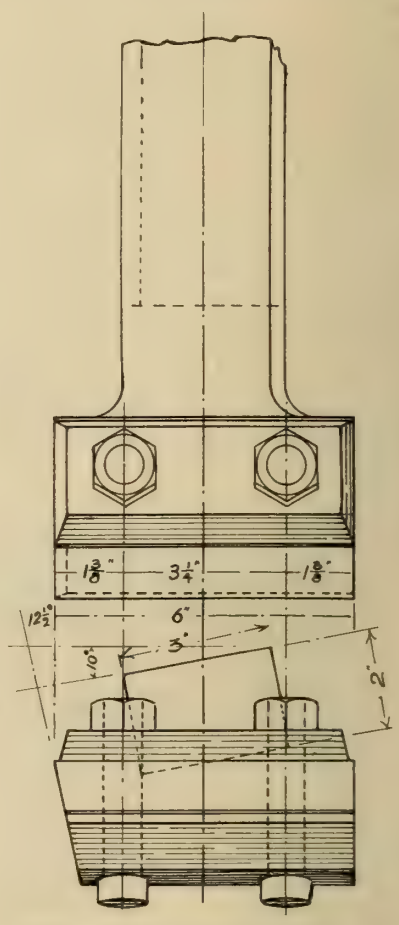
Annealing like hardening and tempering should be done in a very careful way. If for expensive tools it is well to seal up pieces so that the air does not reach them during the process. The heating like the cooling must be done evenly and slowly to secure the best results. It is often necessary to anneal several times in order to eliminate all internal strains in the material, so that the pieces may harden and retain their original shapes. This, however, is not usually done unless the tools have dimensions varying considerably in size. If the steel is treated carefully, almost any desired results may be obtained.

A FINISHING TOOL FOR THE PLANER.

By R. H. Wadsworth.

The finishing cut in planing is usually taken with a tool having a broad cutting edge, usually about 1½" on the larger machines. Such a tool permits a feed of about 1" per stroke of the planer. The accompanying sketch shows how a tool was made permitting a feed of 5" or 5½" per stroke. Such a tool is of advantage on large planers especially, where the time required by the planer in backing is sufficient to allow the operator to move the saddle 5" by means of the feed screw. We found it very profitable on an 8 ft. by 8 ft. planer. The tool gives results as satisfactory on multiple work, where the cutting is intermittent, as when the cutting is continuous. The feed marks remain very apparent but do not show an unevenness of over .0005". The shank or holder of this tool is forged from steel and machined as per the sketch. Two ¾" turned bolts fit closely in the holder. A case-hardened steel washer fits loosely over the bolts. The cutter is a piece of 2"x1" high-speed tool steel, ground so that it bears well in the holder. This tool





Finishing Tool for Large Planer.

may be designed for 1½"x1" steel if such is readily obtainable. By having two such cutters no delay need be experienced while one is at the grinding machine.

This tool turns off a large chip and leaves a smooth, bright surface. A cut as deep as .006" and deeper, may be taken if necessary with satisfactory results.

AN INTERESTING EXAMPLE OF CONTINUOUS MILLING.

The drawing herewith shows the outline of a small machine part, which requires that one of its surfaces be machined flat. This is the simplest kind of machine work, and is the sort of a job on which most well organized shops

would be prepared to make exceptionally good time.

However, by all of the usual processes of machining, even when the work is done on a miller, there must be a certain amount of time allowed the operator for chucking and handling the pieces. Unless the fixtures are made very convenient, this amounts to a good deal more than the time required for the actual machining. The fact is that the modern high power, conveniently arranged, miller does the actual milling

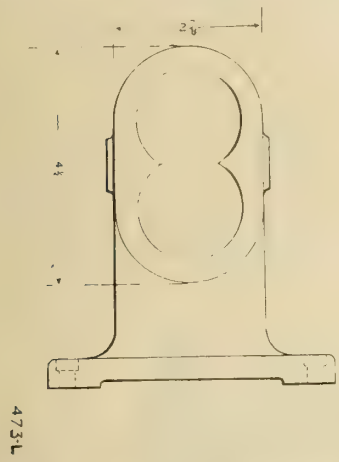


Fig. 1.—Piece to be Machined.

very much quicker in a majority of cases than is possible for the operator to handle the work.

On all such work which can be handled and chucked as quickly as the milling can be done, it is obviously of the greatest advantage to so arrange fixtures that the operator can be chucking one piece while the machine is milling another piece in the same fixture.

In view of all these facts, the accompanying half-tone illustrations will be of particular interest. It shows a No. 2 vertical Cincinnati high power miller, fitted with circular milling attachment, and a special circular fixture arranged to hold eight of these pieces. Each piece is clamped independent of the others, and the fixture is arranged so that the clamping and removing of the pieces can be done in the quickest possible time—so quick, in fact, that an operator can keep the fixture constantly filled with pieces to be milled, while the machine continues in operation without stopping.

It has been found that if the fixture is revolved continuously at such a rate as to pass 220 pieces under the cutter in an hour, the operator will be able to handle this same number of pieces, that is, he will be able to chuck new ones and remove the milled ones at this rate. The operation, therefore, becomes a continuous one. There is no time lost for returning the table, no time lost for chucking the pieces. The rate at which the work can be done depends entirely on the agility and willingness of the operator. For a man of less than average ability the machine can be slowed down so as to enable him to have just sufficient time for his part of the work, while on the other hand an operator of more than average ability could speed the machine up. This same method of milling applies to a variety of small machine parts.

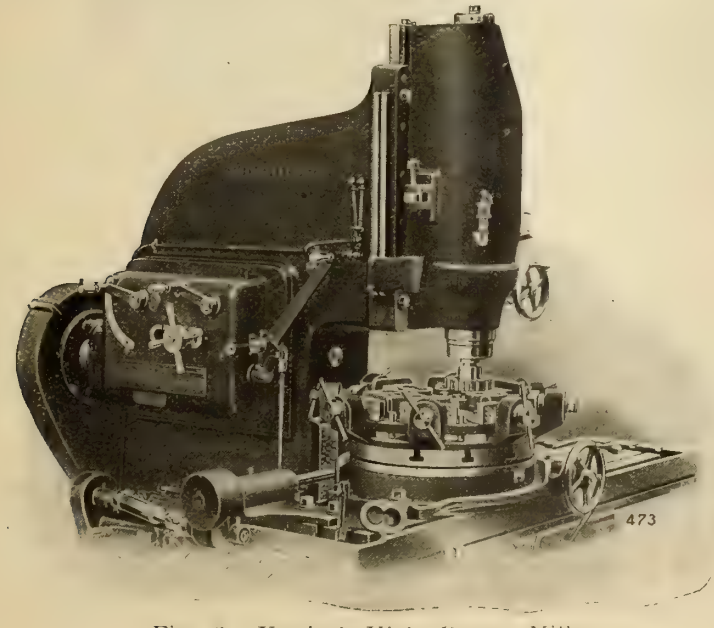

Fig. 2.—Vertical High Power Miller.

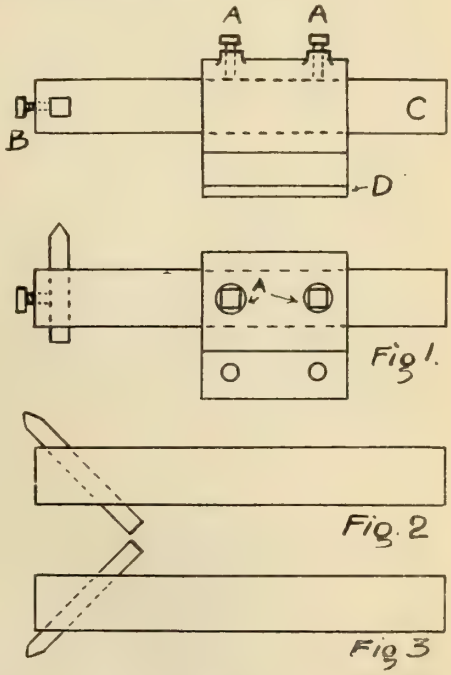
TOOL FOR BORING AND TURNING.

In Fig. 1 is shown the arrangement of the tool for boring. A square hole is made in a bar of round steel, the size depending on the size of tool required. The cast iron holder has a boss D fitting into tool rest and is bolted to it. A, A, tighten the bar in holder and set screw holds the tool in place. This tool may be used for boring or threading.

If there is a shoulder it is necessary to cut the hole slanting as in Figs. 2 and 3. The tool in Fig. 2 is for turning and Fig. 3 boring to a shoulder. To get the position 3, reverse the steel bar in the holder and then reverse the tool.



Tool for Boring and Turning.

CASTINGS TRUCK.

The truck shown in the accompanying line cut is used in an agricultural implement works in connection with their castings department. When the castings are sorted they are put in these steel barrels. Supports on the truck fit the trunnions on the barrel and the barrels of castings are easily moved from one place to another. The economic feature is that one truck is all that is necessary. As each barrel is filled it is moved to the storage bins or to the machine shop if there are machining operations to be performed.

Castings Truck.

TO REMOVE RUST FROM STEEL.

Brush the rusted steel with a paste composed of ½ ounce cyanide of potassium, ½ ounce castile soap, 1 ounce whiting and enough water to make a paste. Then wash the steel in a solution of ½ ounce cyanide of potassium in 2 ounces of water.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

McDOUGALL 16-IN. ENGINE LATHE

The headstock is well ribbed and closely fitted. The bearings are made self-oiling, having deep chambers for this purpose.

Tailstock of the overhanging pattern is furnished, which permits the use of compound rest at right angles when turning short centres. It can be set over and the clamping of the sleeve is accomplished by a new device consisting of a two plug clamp which effectively locks the sleeve.

Bed is of extra weight and depth, with unusual thickness of metal, web-bed in two-foot sections, and will not spring under the heaviest cut. Spindle is made of high carbon hammered steel bored from the solid, accurately ground, and mounted in solid chilled cast iron bearings accurately machined and scraped to perfect fit.

Carriage and apron have been designed with special reference to giving the maximum resistance to the springing and straining of these important parts of a lathe. The carriage has full bearings on V's its entire length, has wide cross V reinforced with an extra amount of metal in cross bridge.

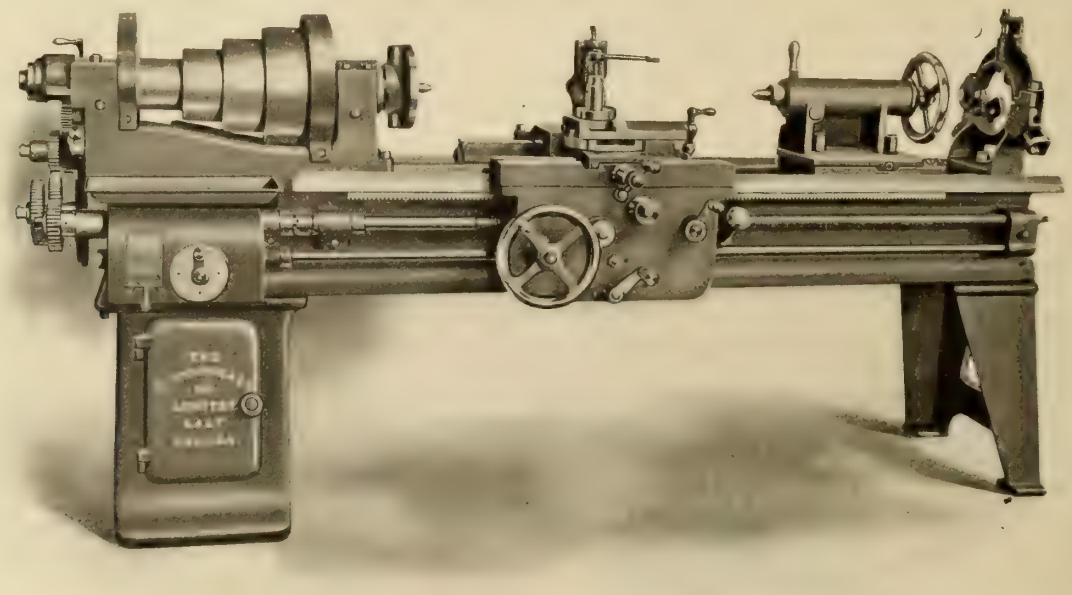
Compound rest is fitted with taper gibs which are adjusted from the end, carefully scraped to slide and has graduated base. Screws both on compound rest and cross slide are graduated reading in thousands.

Feeds both cross and longitudinal are engaged by friction and a safety attachment is provided which prevents screw and feed being engaged at the same time. There are three quick changes on the gear box at the head of the machine, which gives a ratio of 1¼, 2½ and 5 times any thread which may be in use at the time. The feed of the apron is also reversed in the apron.

For screw cutting an indicator is provided on the side of the carriage which renders it possible to cut single, double, triple or quadruple threads without a reversing belt being necessary, for with this attachment the thread may be taken up at any point, thus leaving the second pulley on the countershaft available as another change speed.

Gears and racks are all cut from the solid. Racks are all steel and gears wherever necessary are made from the same material.

This lathe is manufactured by the R. McDougall Co., Ltd., Galt.



McDougall 16-inch Engine Lathe.

McGREGOR-GOURLAY LATHE.

The illustration shown on the following page is a new style of engine lathe recently put on the market. It is intended to do the regular work, required of an engine lathe, and give satisfactory results when used as a high speed lathe.

The head is made with the new design three-step cone and double back gears, the cone is of good width, and diameter.

There is a belt shifter furnished, both on the head of the machine and countershaft, quickly changing the driving belt from one step to the other, by this means the belt can be changed as quickly as the ordinary change in speed by means of slip gears, etc. The change between the two sets of back gears is also operated by means of a lever, which puts all the changes in speed under the instantaneous control of the operator.

The head spindle bearings are solid with the head, being cast on chills which give a very close bearing material, and are afterward machined to a perfect fit for the spindle. These are adjustable and are furnished with a positive oiling device, which keeps a flood of oil in the spindle bearings. This makes practically an everlasting bearing.

The different changes of feed and screw cutting, of which there are fifty, are instantly obtainable by the movement of one, or two, levers. This permits of a heavy roughing cut at a fine feed, and a lighter finishing cut at a coarse feed, getting out of the high-speed steel all that it will stand. It is also of advantage in that it takes no longer to change from feeding to thread-cutting, than from one feed to another.

The automatic cross and longitudinal feeds, which are reversible in the apron,

are gear driven from the spline screw through friction clutches, which give a maximum feed, and at the same time provide against breakage from accident.

The thread on the lead screw is used only for screw-cutting, and it is impossible to engage the nut for screw-cutting and the feeds, at the same time. By the movement of a lever, the saddle is clamped to the bed when cross-feeding.

The hub of the hand wheel which governs the movement of the saddle as well as the handle of the cross-screw, and the screw of the compound rest have micrometer graduated collars. These collars are graduated, both in thousandths and sixty-fourths of an inch.

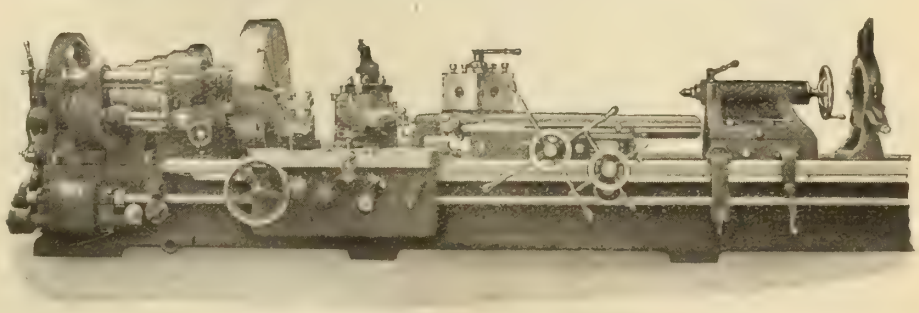
The tailstock is made off-set to accommodate the compound rest, and is clamped to the bed, by means of the handle shown, which stands directly in front of the operator. The sleeve of this tailstock is also graduated in fractions of an inch, which is useful in boring. The cross adjustment is also graduated.

There is on the top of the saddle, a small dial, by means of which it is not necessary to reverse or stop the lathe in cutting screws. The nut is thrown out, the saddle returned by hand, and as the dial is passing the zero mark the nut is again thrown in, which catches the proper thread. This permits of the two friction pulleys on the countershaft being both run in the same direction and gives eighteen speeds to the lathe spindle, which are arranged in geometrical progression, and, as before stated, any one of these speeds is practically instantly obtainable.

This machine is manufactured by the MacGregor-Gourlay Company, Limited, Galt, Ont.

HEAVY PATTERN AMERICAN LATHE.

This lathe is equipped with triple-geared head and turret on shears and is of good design. It is steel geared throughout and of very heavy construction.



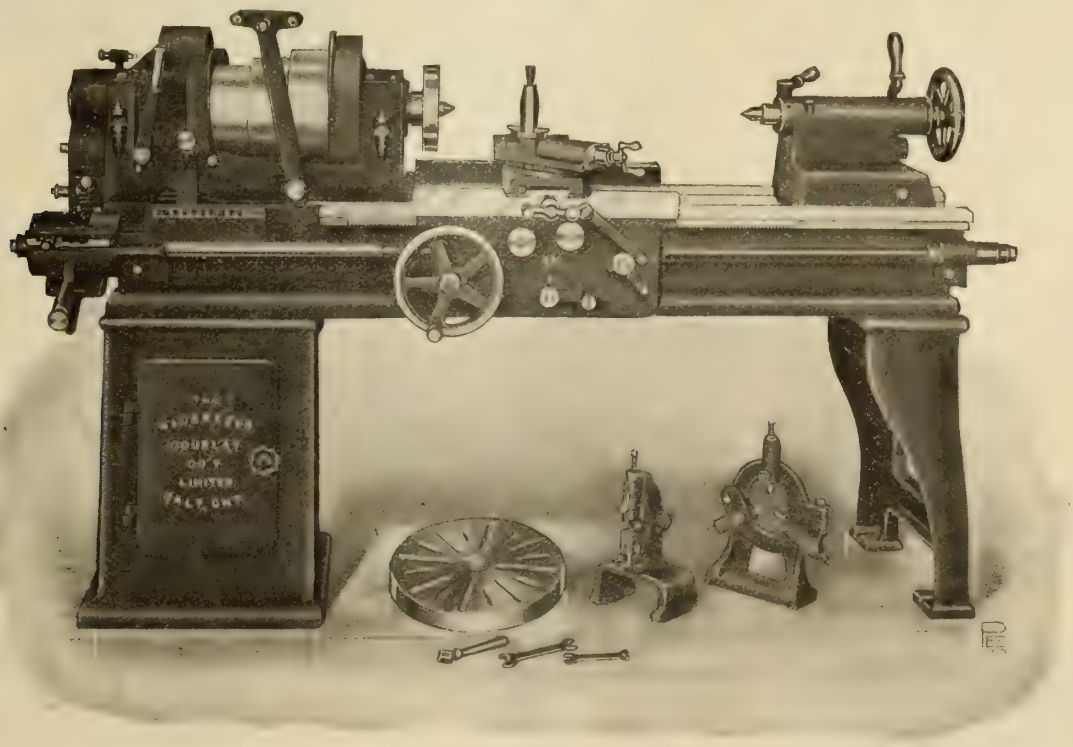
Heavy Pattern American Lathe.

The back gears are automatically disengaged when slipping pinion into internal gear and vice versa. Longitudinal feed of carriage is controlled by a friction, and the cross-feed by a saw-tooth clutch, operated from "star" handle on the apron, which is cam actuated. Rack pinion in apron can be withdrawn while thread cutting. Feed box, on front of machine beneath head stock, supplies three instantaneous changes for feeding and screw cutting, for every change of gears on quadrant at head end of lathe.

The turret is equipped with new indexing mechanism, which is self-compensating for wear. This mechanism is located at the front of turret top-slide.

Turret can be tripped or revolved automatically or by hand. The mechanism can be set so as to be inoperative, when wishing to run the slide back to extreme limit, without withdrawing the locking-pin or revolving the turret. This is accomplished by the small lever shown near the large pilot wheel. The turret top-slide is supported on its outer end by a gibbed bracket attached to the front of the slide which travels along the V's of the bed and through its support eliminates all tendency to spring under a long reach. The bracket can be removed should the work require that the turret slide pass over the carriage of the lathe.

The bottom-slide of turret is moved along the bed by the pilot wheel shown



New Style MeGregor, Gourley Engine Lathe.

at rear end. It is clamped to bed by two eccentrics, one at the front and the other at the rear end. It is further secured from slipping, due to severe end-thrust, by a pawl, which, dropping from the turret, engages a ratchet-toothed rack cast in the centre of the lathe bed.

Eight well selected feeds are supplied to the turret, ranging from .005 in. to .162 in., which are entirely independent of the regular carriage and apron feeds. Turret feeds are controlled by the two "star" knobs, carrying index dials, which are shown one directly above the other on the front of the bed near the feed box. The dials and pointers thereon, indicate at once the feed in inches as set, and all changes can be made while the lathe is running. The "star" knobs operate through shafts, extending through the bed to the quick-change turret-feed-box at the rear of head-stock, which is provided with a neat and substantial cover.

Provision is made on the compound rest slide to quickly attach the turret top-slide to same. This is very valuable when wishing to impart to the turret the feeds of the carriage, such as in large tapping operations. In such a case the taps get a "positive lead," since the screw-cutting mechanism can be engaged in the apron and the proper lead thereby transmitted to the turret slide, carrying the tap. This feature is also of value in ordinary jobs of chasing internal threads with a turret tool.

Feeds of turret can be reversed when wishing to "back face" or "counterbore." Reversal of feeds is controlled by the lever, conveniently located on driving sprocket of quick-change turret-feed-box. The taper attachment is equipped with vernier for fine adjustment.

This lathe is manufactured by the American Tool Works Co., Cincinnati.

KNURLING TOOL FOR LATHE WORK.

The knurling tool is shown in the accompanying illustration.

Exclusive of the rolls and pins, it is composed of but two parts—the shank, and the rocking holder for the rolls. The holder fits into a tongued and grooved circular seat in the shank, being retain-

Knurling Tool for Lathe Work.

ed in place there by a pin passing through a circular groove in the tongue formed on the shank. The holder is thus free to swivel when brought in contact with the work. This method of self-centering gives practically no lost motion, and the joint has ample bearing to resist the strains of both end and side thrust.

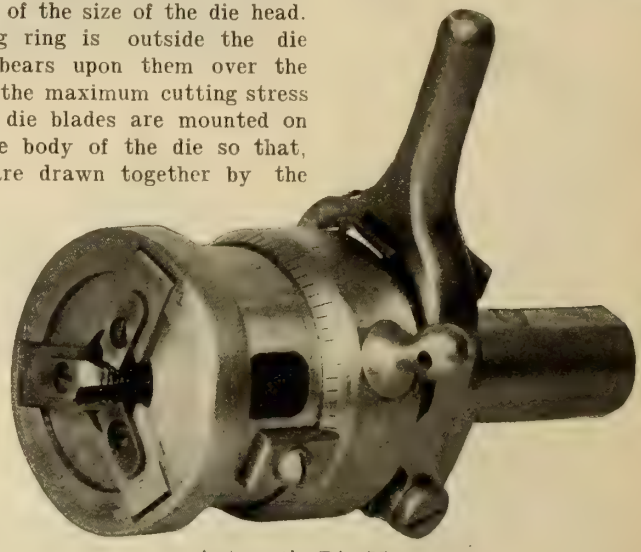
This tool is furnished with either coarse, medium or fine knurls. The knurls and pins are made of hardened tool steel. The other parts are drop forged or bar steel, hardened.

The knurling tool is made by the Armstrong Bros. Tool Co., 113 N. Francisco Ave., Chicago, Ill.

AUTOMATIC DIE HEAD.

Several new features are incorporated in the Diamond automatic die head. These are the arrangement for discharging the chips from the die head ; method of overcoming unequal wear on the cutting blades or chasers ; greater range of diameters of work to each size head, and decrease of the size of the die head.

The closing ring is outside the die blades and bears upon them over the point where the maximum cutting stress comes. The die blades are mounted on pivots in the body of the die so that, when they are drawn together by the closing ring, the outer ends of the blades, where the heaviest wear occurs, are closed in faster than the portions nearer the pivots, thus compensating for unequal wear.



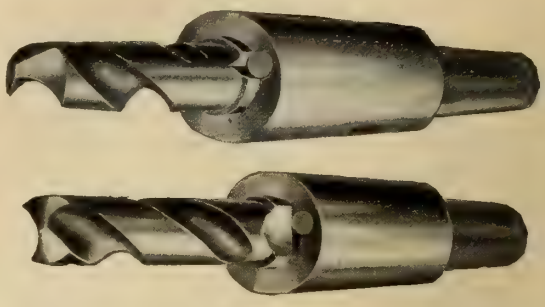
Automatic Die Head.

Large openings are provided through which the chips are flushed by the lubricating oil. An internal stop pin trips the die. On the reversal of the turret the die may be closed either by hand or by a small, easily made cam secured to the turret slide and bearing on the closing lever on the backward motion of the turret.

This automatic die head is manufactured by the Diamond Power Specialty Co., Detroit, Mich.

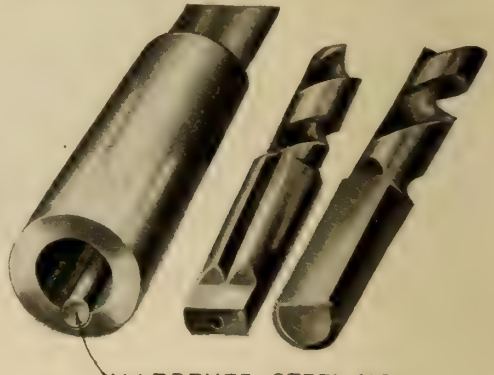
STAY-IN DRILL SOCKET.

The main advantage of this drill socket is the fact that they hold the drill in the socket without the necessity of a tang, and also by the use of special jigs, which the makers send to their customers, the drill press spindle may also be fitted up with one of their round steel keys. With this method employed in a shop they are able to use up all the old drills with broken tangs and prevent the good drills from having their tangs broken. They can also keep



their sockets from falling out of the drill press spindle.

The shells of these sockets are made from 1-16-in. to 1-8-in. thicker than the standard drill socket, so that the insertion of the hardened steel key does not weaken them. These keys are made from tempered drill rod varying in diameter $\frac{1}{8}$-in. to $\frac{3}{8}$-in. They project one-third of their diameter into the open-



ing. These keys are all pressed in socket absolutely parallel with the angle of the bore and central with the tang slot. The shank end of the socket has a standard 90 degree V-groove, milled

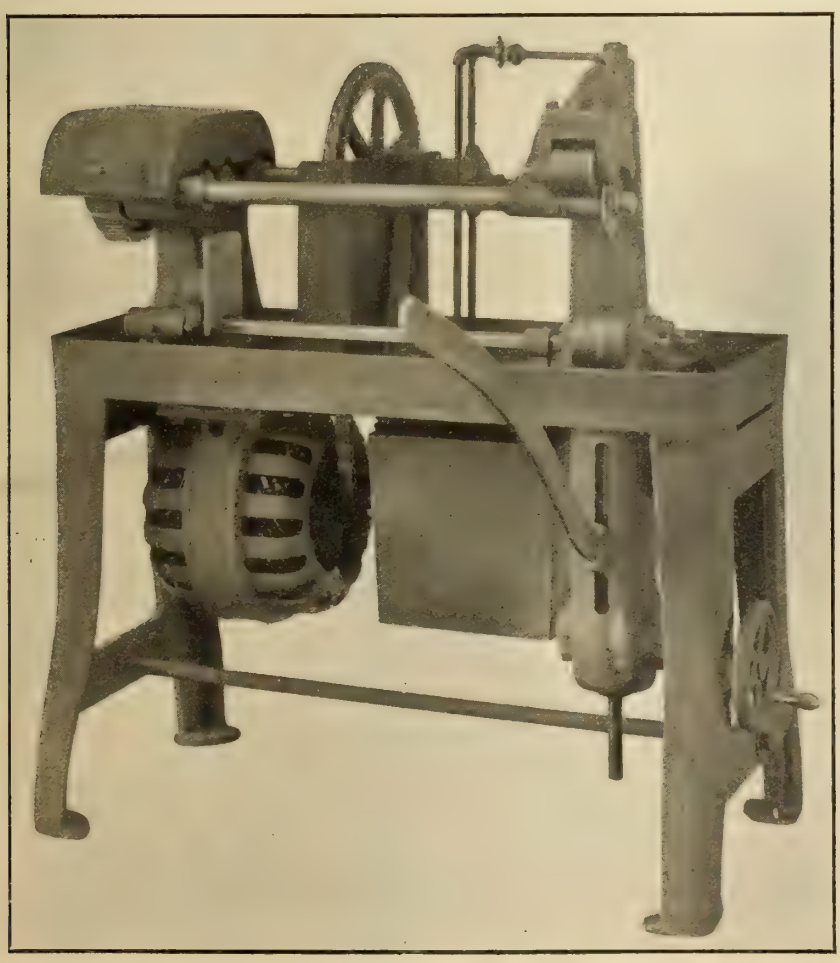
its entire length, central with the tang. As these keys and grooves are all made standard by accurate jigs, they are all interchangeable with each other, allowing any combination of sockets.

As shown in the illustration it is only necessary to grind a flat on the old drills. The drift hole in socket is made extra long so that they can be easily knocked out. New drills can be ordered with the V-groove in shank from all makers at no additional cost. Drills in stock can be fixed up in a few minutes each in a milling machine. A bearing of whole length of keyway is given.

This development of drill socket is the invention of George R. Lang, and is manufactured by the G. R. Lang Co., Meadville, Pa.

MOTOR-DRIVEN PIPE OR TUBE CUTTER.

The machine is very compact in arrangement, and in place of the regular tight and loose pulleys is placed a large sprocket for the Morse silent chain drive. Two of the machines, as shown,



Motor Driven Pipe and Tube Cutting Machine.

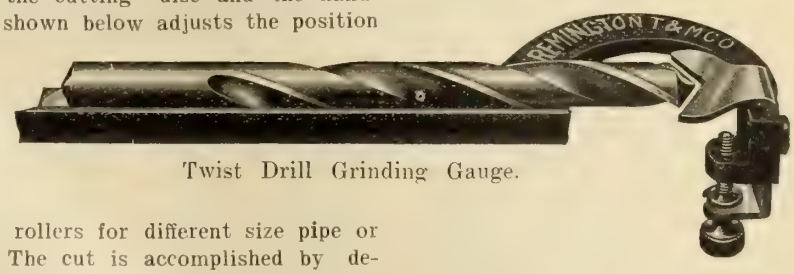
were recently furnished to one of the largest railroad systems in the country for their locomotive boiler shop for cutting off boiler flues, safe ends, etc. The machine will cut off 4-in. boiler flue in about eight seconds.

Power from the motor is transmitted through the Morse silent chain and a series of gears to the cutter shaft. The flue to be cut rests on the two rollers under the cutting disc and the handwheel shown below adjusts the position of the rollers for different size pipe or flues. The cut is accomplished by depressing the lever which raises the rollers, bringing the flue against the cutter disc and severing it in a very short space of time, in fact, 1½-in. standard wrought iron pipe can be cut in about three seconds in this manner.

The machines are manufactured by the Fox Machine Co., Grand Rapids, Mich., 826-846 N. Front St., and equipped with 3 h.p. Westinghouse A.C. motor, for 440 volt circuit, 60 cycles, 3-phase.

TWIST DRILL GRINDING GAUGE.

This is a simple, efficient and economical tool devised for testing the accuracy of twist drills. The sharpening and grinding of twist drills is important. That the cutting edges have a proper and uniform angle (59 degrees) with the longitudinal axis of the drill, having them of exactly equal length and the lips of the drill well and sufficiently



Twist Drill Grinding Gauge.

backed off or cleared, are features generally recognized as essential to the perfect performance of a drill.

This gauge is made in three sizes by the Remington Tool & Machine Co., Boston, Mass. These have a capacity up to ½", 1" and 2" drills. It is simple in construction and adjusted by the thumb screw at the bottom, the gauge plate being raised or lowered to suit the size of drill.

PERSONAL.

H. W. Petrie, of H. W. Petrie, Ltd., Toronto, is in Vancouver on business.

E. I. Sifton has been appointed Engineer of London, Ont. Mr. Sifton will commence his duties at once.

F. A. Rundell, Chief Engineer, Whiting Foundry Equipment Company, Harvey, Ill., was recently in Montreal on business.

Anton Berg, president of the Berg Machinery Mfg. Co., Toronto, attended the fifth annual convention of the Sand Lime Brick Makers' Association in Washington, Dec. 16th and 17th.

Mr. J. R. Spragge, formerly road foreman, has been appointed district master mechanic on the Canadian Pacific Railway, with headquarters at West Toronto, Ont.

W. N. Ryerson, general superintendent of the Ontario Power Company, Niagara Falls, Ont., leaves on January 2nd, 1909, to take a position with the Great Northern Power Company, Duluth, Minn.

H. M. Lane who has been secretary of the Foundry Supply Association (connected with the American Foundrymen's Association) since its formation, recently tendered his resignation. Mr. Perkins, president of the Supply Association, has appointed C. E. Hoyt, of the Lewis Institute, Chicago, to complete the remainder of Mr. Lane's term. Mr. Hoyt is well known to the foundry supply trade as he has been secretary of the Chicago Foundry Foremen's Association for several years and has conducted the exhibits of foundry equipment that have been held at the Lewis Institute for the past two years.

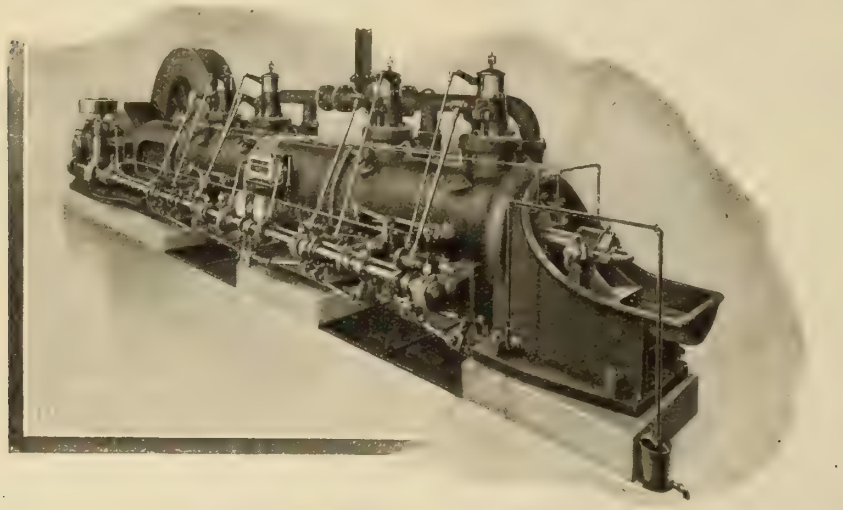
GOLDIE & McCULLOCH GAS ENGINE.

The Goldie & McCulloch Co., of Galt, has recently acquired the Canadian rights to the gas engine patents of Mr. L. F. Burger, of Beloit, Wis., and has designed a type of engine embodying the essential features of these patents.

As will be seen from the illustration, this is a two-cylinder tandem double-acting engine—a type now generally adopted for high power engines, as it has the advantage of obtaining power from four cylinder ends without any increase in the size of frame, shaft or pins, and at the same time gives two impulses every revolution.

Valve Gear.

One of the most important features of the engine is the method of admitting the gas and governing the quantity. The



Goldie & McCulloch Gas Engines.

governing is done by admitting suitable quantities of a constant mixture. This mixture is admitted through an auxiliary valve whose time of opening is controlled by the governor. The valve is placed directly over the main inlet valve, which opens slightly before the piston reaches the end of its stroke and admits free air to the cylinder producing a scavenging effect. The auxiliary inlet valve is afterwards opened where determined by the governor and closes at the end of the stroke. Variable quantity with constant compression is thereby obtained. The governor used is the celebrated "Rites Inertia Governor," which is adapted to taking care of sudden changes of load with a minimum change in speed. The main inlet and exhaust valves are of the mushroom type, with removable seats in water-cooled cages.

The main valves are operated from a cam shaft fitted with cams engaging with rollers on the ends of the valve rod levers. These cams and rollers are designed to give accurate timing to the valves and have large wearing surfaces. The auxiliary valves are operated from a supplementary cam shaft running parallel to the main cam shaft and connected to it and the governor through a "floating" gear arrangement.

The pistons and rods are water-cooled and are supported by the main cross-head, and also intermediate and tail cross-heads, thus keeping the weight of the pistons off the bottom of the cylinders and giving the packing and lubrication every chance to be effective. The lubrication of the pistons is effected by a positive feed oil pump, which is so arranged that the drop of oil can be delivered to the interior of the cylinder at exactly the right moment. The piston rod packing is metallic of a design that has proved its worth on some of the largest engines built in America, and is extremely simple, and, if properly installed and cared for, should last indefinitely.

Cylinders and Frame.

The cylinders are water jacketed, the jacket being provided with a large number of handholes which give easy access for cleaning out should the circulating water be of such a nature as to leave a deposit.

The frame connecting piece between the cylinders and the tail cross-head support are heavy castings with the metal properly distributed to carry the strains. The peculiar design of the cylinder connecting casting with its large opening and removable strut gives a convenient access to the intermediate cross-head and cylinder covers. The frame is provided with a cross-head of large diameter which enables the front cylinder cover and piston to be removed without disturbing the crank shaft. The crank shaft is supported by a main bearing on each side of the crank pin, thus distributing the strains evenly about the centre line of the engine and providing enough bearing surface to keep the unit pressure within safe limits for continuous service. The main bearings are provided with wedge adjustment.

The crank shaft is made from a solid steel forging and is liberal in its dimensions and besides the two main bearings is provided with a large adjustable self-oiling outer bearing on the fly-wheel side. The crank carries counter-weights of sufficient weight to properly balance the engine.

The starting device is extremely simple and automatically admits compressed air to the two inner cylinder ends so that these can be used to start the engine. When well started gas can be admitted to the two outer ends and got under working condition when the air can be shut off and the other two ends started firing.

The igniter mechanism is of the make and break type, and the timing of the spark is adjustable by hand when the engine is running. The engine is provided with two magnetos for supplying the current when the engine is up to speed and a double set of batteries and spark coils for starting.

The water circulation is arranged so that each part can be given just the amount of water required. Discharge funnels are provided on all outlets so that the operator can feel the temperature of the discharge water.

The Goldie & McCulloch Co., Limited, are manufacturing producers to furnish with their gas engines which are to run on producer gas. These producers are built under Burger patents.

A HANDY TUBE CUTTER.

By G. Campbell.

The tubes of a locomotive boiler become covered with scale, overheated and then they finally blister. These blistered tubes must be replaced at once if the locomotive is to be retained in service. In the G.T.R. at Stratford, Montreal and Toronto, a handy device is used for cutting out the tubes.

The accompanying sketch illustrates this tool, giving dimensions of the various parts. The steel cutter is seven-sixteenths inches from the shoulder, and the cutting point is one-eighth inch back from the centre. The cutting edge is 7-32 inch face and ⅛ inch at back, thus giving a clearance. The slot is 11-32 inch deep, and in this the small eccentric crank pin works. Reversing the tool draws the cutter into the crank or mandrel and the tool may then be removed from the flue. The travel of the eccentric is ½ inch, the crank pin being ¼ inch from the centre. The pin is slightly longer than the depth of the slot in the cutter, so that the pin reaches to the back of the slot.

The steel crank is 2⅞ inches long, and is 1 3-16 inches in diameter. The tube rests against the smaller collar. The centre of the blade is 1 11-16 inches from the collar cutting off 1⅝ inches of the tube. The corner on the shoulder of the mandril is cut out as shown in the sketch, and a pin working on this curve throws the cutter into working position or the reverse. This pin on the large collar stands best when made of wrought iron and case-hardened.

A small clamp made of machinery steel and case-hardened holds these two parts together. The handle is connected to the tool by means of a toggle joint. At the G.T.R. in Toronto the handle is arranged for extension. In place of the square iron handle running all the way, a 1¾ tube has been forged on at the toggle joint. This tube is 2 feet 2 inches long and is squared at the outer end to receive a 1 inch square iron. The awkwardness of a long handle is thus removed as the iron rod can be run in or out of the tube to the required length. A collar is welded over the outer square end of the tube to insure strength.

The bar for supporting the tube cutter is bolted across the smoke box. The holes are drilled with 3 inch centres, but usually the rest plate is only shifted three or four times, cutting the tubes from a boiler as the toggle joint allows the tool to be used in any position. Adjustments on this bar allow it to be fitted to a large or small smoke box. The tool is worked by a ratchet wrench, and a few turns cut the tube from the boiler.

SUBSCRIPTION RATE.

Canada, United States, $1.00, Great Britain, Australia and other colonies 4s. 6d., per year; other countries, $1.50. Advertising rates on request.

Subscribers who are not receiving their paper regularly will confer a favor on us by letting us know. We should be notified at once of any change in address, giving both old and new.

TRADE SUGGESTIONS.

Several firms in Canada are now endeavoring to find a market in Great Britain for various kinds of machinery. Catalogues have been sent to the Department of Trade and Commerce, together with requests for information regarding probable openings for trade. While it is not possible to obtain particulars of the multifarious types of machinery imported by midland firms, every effort is made to acquire such information as will enable the department to decide whether specific Canadian machinery is salable or not. The most commendable course is for Canadian firms to send a representative to this district to conduct their own investigations, as they would possess the necessary technical knowledge, without which it is exceedingly difficult, if not impossible, to interest probable buyers. Letters of introduction could be taken from the office of the Department of Trade and Commerce, by which means there would be no difficulty in obtaining a sympathetic consideration of any proposition Canadians may have to make. In the initial stages correspondence is unsatisfactory and seldom productive.

The Department of Trade and Commerce desires to seek the co-operation and assistance of Canadian exporters and manufacturers, with a view to the further extension of Canadian trade abroad. The Deputy Minister of Trade and Commerce invites those interested to give the Department the benefit of their views, with the hope that suggestions may be offered which will not only add to the usefulness of the Department, but will tend to promote Canadian trade

This Department requests that suggestions may be received to the following questions, after having been given due consideration:

(a) What would you advise should be done to increase the export trade of Canada?

(b) What improvement or change do you think desirable in the compilation of the trade statistics published by this Department?

(c) Can you suggest any improvement in the collection and publication of commercial information received from the Trade Commissioners?

As far as possible the suggestions should be accompanied by statements showing the reasons therefor. Should there be any general information which it may be thought desirable to communicate to the Department and which is not covered by the above questions, the information will be welcome.

WHY NOT A TECHNICAL PUBLICITY ASSOCIATION IN CANADA.

In New York there exists an association well known among publishers of trade papers, engineering and technical magazines with a membership consisting of those who are actually filling the position of advertising manager in concerns engaged in manufacturing machinery or in concerns who are allied with the machinery industry.

Probably one of the association's most important accomplishments is the securing of statements and information pertaining to advertising mediums. The circulation committee keeps records relating to circulation and statistics of various papers, obtaining new or revised information on request of members, who hold same in strict confidence.

There are no axes to grind in this association. Topics under discussion at meetings are usually laid bare and studied from every view point. The friendly interchange of ideas, the real experiences, with co-operation from interested friends have made the association very edifying and largely recognized among the advertising fraternity throughout the entire country and abroad.

With such an association in Canada there would be more publicity given to new machinery. The advertising department in most United States companies is well organized and publicity is given to every new machine placed on the market, the technical papers being given full information in regard to them.

In Canada technical papers come across new machines accidentally. The Canadian advertiser has not been educated in making them known, and the establishing of such an association would do much towards bringing out methods of obtaining publicity and show a manufacturer how to make best use of facilities at his command. People do not know about some of the machinery being built in Canada and making them public would interest the reader, give the manufacturer publicity and do justice to our country.

One good point about United States and Canadian publications is the space given to new machinery being placed on the market. In the Bulletin of the association for November, giving the proceedings of the meetings and a list of the members, is printed a speech on Foreign Publications by President C. S. Redfield, of the Technical Publicity Association, in which he states that there were a poor quality of trade papers in Europe giving as a reason the little demand.

There is a demand for good trade papers in Canada and the United States. The establishment of a technical Publicity Association in Canada along similar lines to the above organization would be of great benefit to both advertising and sales departments connected with manufacturing and supply houses.

Qualities by Which Any Man May Climb to the Top

Rungs in the Ladder of Success—High Up There are Numerous Vacant Places Awaiting Occupants — The Present Holds Great Opportunities.

By THE EDITOR

Canada has awakened. All parts of the Dominion are teeming with business and the joys of living. Every man, young or middle-aged, should be alive to the boundless opportunities offering themselves. Illimitable resources are being discovered and developed. Never in the history of this country has there been such a call for young men, ardent for work and with progressive ideals, to take their place in the growth of the nation. Everywhere the smoking chimneys and large factories speak of a world of industry where there are numerous opportunities awaiting the man who will avail himself of them, and has the courage and ability to undertake the work.

A ladder leads upward. Are you preparing yourself for advancement? Do you realize that before you are chances that have been denied your parents who surmounted many difficulties that have since been eliminated. Possibly the success of the statesman and the millionaire may not be yours, but real, genuine satisfying success awaits you.

With the beginning of the New Year, let us suggest some resolutions that will help you on the road to success which comes only with work.

The Nobility of Labor.

When the president of a railroad wishes his son to learn railroading, where does he place him? In the office? No man ever learned a business in the office. The way to get along is to go to work with the hands. It is in the shop where things worth while are learned and when you know how to make your hands support your head you can learn to make your head support your hands.

The mechanic is the backbone of the nation. He is the great producer who is daily adding to the wealth of the world. He it is, who makes the wheels of industry and commerce revolve. The mechanic may hold his head high and look the whole world in the face for he is an important and indispensable factor in the commonwealth. He wears smock and overalls but the sinewy hands and prominent muscles are a tower of strength. The writer knows the call of the seven o'clock whistle, the clink of the time check, the dinner pail, the smock and overalls and the line-up on pay day and is glad of it. One resolution that should be included by every mechanic at the present time is the one suggested in the morning prayer of Robert Louis Stevenson:

"The day returns and brings us the petty rounds of irritating concerns and duties.
Help us to play the man; help us to perform them with laughter and kind faces; let cheerfulness abound with industry
Give us to go blithely on our businesss all this day; bring us to our resting beds weary and content and undishonored, and grant us in the end the gift of sleep."

We extend to our readers and advertisers best wishes for a happy and prosperous New Year.

Definite Aim.

"Not failure, but low aim, is crime." Have a definite high aim. No one has even yet climbed higher than his ideal and no one ever shall. Be ambitious. Keep the top rung of the ladder in view.

"Not enjoyment, and not sorrow,
Is our destined end or way;
But to act that each to-morrow
Finds us farther than to-day."

Man with no ideal beyond the daily round is like a ship without a compass. He is tossed about on the sea of life with no definite purpose in view, and he accomplishes nothing. The men who have given the world something had a purpose in view. James Watt's double-acting steam engine was not discovered by chance. He had something in view and worked faithfully until he accomplished it. The man with a purpose will climb the ladder while his companion gropes around the foot of the ladder seeing no farther ahead than his daily work.

There are several qualities which point towards the top rung of the ladder and by which a man may ascend. Let us suggest some of these rungs which will secure advancement.

Confidence.

Be confident. Don't overestimate your ability; don't underestimate it. Believe in yourself. Have something definite to do, and do it. That's all there is to success in life. Too many young men want success before they have earned it. They become discouraged before they have tried.

Determination.

Let no obstacle stop the accomplishment of your purpose. Christopher Columbus discovered America when his sailors laughed at him. The Bell telephone system covers Canada from Halifax to Vancouver, yet at first the inventor could not even sell stock in his company at any price. Wellington, Frobisher, Drake and Nelson succeeded because they were determined. Once the heavy iron jaw was set, nothing could change their purpose. Success comes to the determined man.

Enthusiasm.

"The work that we love, we rise betimes
And go to with delight."

Learn to love your work. Be enthusiastic. Enthusiasm is a quality that must be cultivated. It is one of the least common. Be not afraid of being considered odd. The man who occupies the premier's chair and undertakes the great public works of our country, and the men who are the captains of industry are enthusiastic men. The progressive enthusiastic man must be recognized.

Perseverance and Patience.

Patience is the hardest to endure. We are not content to work up the ladder one rung at a time. We want to reach it in a flying machine. We must earn our advancement. It is discouraging sometimes, but where the spirit of stick-

to-itiveness manifests itself, a man must go forward. James Watt's improvements in the steam engine were not made in a day. Wireless telegraphy was the result of years of labor. The locomotive had to be developed and perfected. George Stevenson and his son, Robert, worked faithfully on the improvement of the locomotive for years before success crowned their efforts.

Others may do much to improve conditions, but we must each do our own share, and when we seem to be accomplishing little, when courage is at low ebb, think of the men who toiled fifteen, sixteen, seventeen and eighteen hours a day against the greatest skepticism, and their achievements. Be optimistic and persevere. The patient, plodding application will exalt your position. The tale of the tortoise and the hare is familiar. Let this be your motto. "To strive, to seek, to find, and not to yield.

Pluck and Iudustry.

Success comes only with work. Andrew Carnegie's motto is to do your duty and a little more, and he has tried to follow it.

Success is obtained, not by never making mistakes, but in never making the same mistake twice. The man who never made a mistake never accomplished very much. Work honestly. Work intelligently. Find your talent and then work with enthusiasm and determination. Success was never obtained by wearing the dial off the clock.

The most important step toward success is to know your work, and knowing it, to do it intelligently and conscientiously, remembering that—

"Pluck wins. It always wins, tho' days be slow,
And nights be dark 'twixt days that come and go,
Still pluck will win. Its average is sure.
He gains the prize who can the most endure.
Who faces issues—he who never shirks,
Who waits and watches, and who always WORKS.

The Top Rung.

We have a prophetic vision of the top rung. As rung by rung the ladder is ascended, the horizon broadens out and the narrow, selfish opinions disappear. One never forgets the steps by which he ascended, ambition, a definite high aim, and confidence in one's self are among the first, and patience, honesty, perseverance, optimism, determination and enthusiasm are other rungs in the construction of the ladder of success. Forming the sides and supporting it is good, honest, faithful work.

CANADIAN CLAY PRODUCTS MANUFACTURERS' ASSN.

The annual convention of the C.C.P. M.A. will be held in Brantford, Ont, Tuesday, Wednesday and Thursday, January 12, 13 and 14, 1909.

ENGINEERS' CLUB, TORONTO.

The annual meeting of the Engineers' Club was held on December 10th. The election of officers resulted as follows: President, A. B. Barry; first vice-president, A. M. Canniff; second vice-president, R. G. Black. The directors, who are also chairmen of the committees, rooms, library and papers, are R. A. Baldwin and Stanislas Gagne.

At this meeting C. R. Young read a paper on Artistic Bridges for Populous Districts.

The annual dinner was held at McConkey's on Dec. 17. Mr. Randolph, of Chicago, was the speaker of the evening and gave an interesting account of the Panama canal.

CANADIAN RAILWAY CLUB MONTREAL.

The Canadian Railway Club held a well attended meeting in the Windsor Hotel, on Tuesday evening, December 1st. A paper on "Steel Rails in Canada" was read by Mr. F. P. Gutelius, General Superintendent Lake Superior Division Canadian Pacific Railway.

One of the points brought out was the difficulties encountered by the manufacturers in trying to suit the severe climatic conditions prevalent in Canada. In view of the recent discussions among railway men regarding broken rails and other rail causes of accidents on Canadian railways, the paper was received with much interest by those present.

At the January meeting Prof. Bancroft will give a lecture on British Columbia.

CENTRAL RAILWAY AND ENGINEERING CLUB, TORONTO.

Before a well attended meeting of the Central Railway and Engineering Club Dec. 22, A. M. Wickens read a paper on "Electrification of Steam Railroads in Canada."

Mr. Wickens pointed out that the existing transportation facilities in Canada were taxed to their utmost. By their electrification, the carrying capacity of the tracks of these roads could be increased by thirty per cent. and the present congestion relieved. All trains could be run at a less cost by electricity than by steam. Electricity gave double the draw-bar pull per pound of coal than did the steam locomotive. Electric locomotives could go up a 2 per cent. grade at 10 miles an hour, while a steam locomotive was generally going two miles an hour at the end of a long grade. At ten miles an hour the electric locomotive could draw 20 per cent. more freight. The centre of gravity in electric motors was lower than with steam locomotives. This did away with the swinging motion when the train was travelling at a high speed and thus considerably lessened the strain on the roadbed.

At the close af the discussion the following officers were elected.

President, C. A. Jeffery, Master Mechanics, Consumers Gas Co.; 1st Vice-President, J. C. Garden, General Foreman, G.T.Ry., Toronto; 2nd Vice-President, Howard G. Fletcher, Rep. Garlock Packing Co., Toronto; Executive Committee, R. Patterson, Master Mechanic, G.T.Ry., Stratford; G. Black, Road Foreman G.T.Ry., Stratford; J. Bannon, Chief Engineer, City Hall, Toronto; G. Baldwin, Yardmaster, Canada Fdry., Co., Toronto; J. Markey, Master Mechanic, G.T.Ry., Toronto; H. Ellis, Machinist, Consumers Gas Co., Toronto; W. R. McCrea, Master Mechanic, Toronto Railway Co.; Auditors, F. G. Tushingham, Chief Engineer Tor. Ry. Co., Toronto; J. W. McLintock, Accountant, G.T.Ry., Toronto; W. A. Hare, Standard Engineering, Toronto; Reception Committee, A. J. Lewkowiez, Mechanical Engineer, Toronto; J. W. McLintock, Accountant G.T.Ry., Toronto; D. C. Hallowell, Air Brake Inspector, G.T.Ry., Toronto; E. Logan, Machinist, G.T.Ry., Toronto; J. Herriot, Asst-Gen. Strkpr., Canada Fdry. Co., Toronto; W. A. Hare, Standard Engineering, Toronto; R. Pearson, Machinist, Consumers Gas Co., Toronto; H. Cowan.

A.S.M.E. ANNUAL MEETING.

The twenty-ninth annual meeting of the American Society of Mechanical Engineers was held in the Engineering Societies' building, 29 West Thirty-ninth Street, New York, December 1 to 4, inclusive.

The following are some of the papers presented at the meeting: Efficiency Tests of Milling Machines and Milling Cutters, by A. L. DeLeeuw; Metal Cutting Tools Without Clearance, by James Hartness; Interchangeable Involute Gear Tooth Systems, by Ralph E. Flanders; Training Workmen, by H. L. Gantt.

The discussions on the papers brought out many valuable points. About twenty papers altogether were read and discussed and it would be to the interest of Canadians to take an interest in this association.

The December issue contained the paper of A. L. DeLeeuw. In this issue is that of James Hartness, and in the February issue will be given the one on Interchangeable Involute Gear Tooth Systems.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

METAL MARKETS.

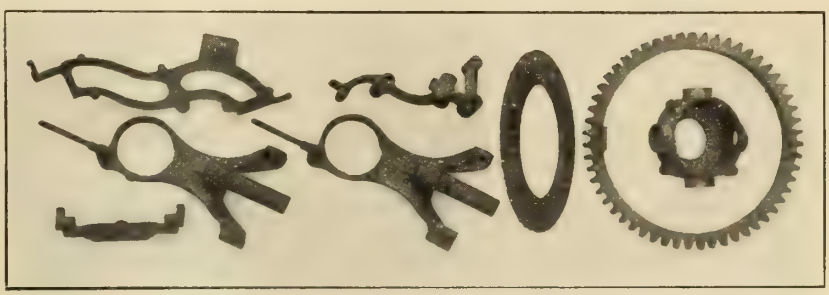
Despite the fact that we have entered upon the dull season of the year, trade in Canada has kept up well during the month. Naturally there has been a decided easing off in the large orders, as most of the big consuming firms covered themselves before the close of navigation. Even in these cases the stocks are not very large, and a strong consuming demand would soon find the concerns in the markets again. The smaller buyers have been practically making the markets lately, and from the regularity of the orders it is evident that a fair amount of metal is being put upon the market in the finished shape, as most buyers will not purchase until they receive their trade order first. Imported pig is likely to be stiff in price later on, as many users apparently did not cover themselves properly before the end of the open season. There has been such a run on store iron that before long shipments will have to be made from the Old Country with the additional winter freightage to pay.

Canadian prices have been somewhat affected by the change in the primary markets, although the good, steady trade done tended to keep the markets stiff. Tin has been a steady seller all the way through, but the weakening in the primary markets forced prices down, and small jobbing lots have been ranging around 33c. Copper has ruled at about the same prices as in November, the changes in the primary markets not being drastic enough to depress quotations here much. Figures are now about 15¼c to 15½c for jobbing lots. Business has been very steady, with inquiries good. Heavier trade may come, though at the commencement of the year. Canadian furnaces have been showing considerable activity, the tonnage changing hands, it is reported, being greater than at any time during the past two or three months. Several large lots of 500 tons and upwards have been sold at prices which show an advance of 50c to $1 per ton on the low prices of August and September. In fact, some small lots have realized fully $2 more on the lowest figures. There is no doubt that the improved conditions in the States have strengthened the home markets, helped by the good demand and the store prices for imported pig. Owing to firmness at London and St. Louis, spelter prices were advanced, and quotations have been ranging around $5.50. Very fair business has been done. Lead has not changed from our last quotation of $3.80.

PRESSURE DIE CASTING.

The Lumen Bearing Co., corner Weston road and C.P.R. tracks, West Toronto, have installed some interesting machinery for the manufacture of pressure die castings.

Their plant in West Toronto is well equipped for the manufacture of lumen bearings, bronze and brass work. They have handled brass castings of nearly 3,000 lbs. amd molded manganese bronze weighing 2,200 lbs. In one mold the cope contained 5,000 pounds of sand. Over 4,200 pounds brass and bronze are poured at a heat and three heats are run per day. Some furnaces run five heats when aluminum is run between heats of brass. They have also a capacity of 2,500 lbs. babbit per day.



Samples of Pressure Die Castings.

The new die-casting department is interesting and sample castings made by this process are here shown. An ingenious patented machine is used for the work. This process is of special use where perfect yet intricate castings are required, these in varied shapes and sizes being shown in the illustration.

The castings are made accurate to .001 of an inch, and where holes at varying angles to one another are required those also are located accurately in the casting. If it is desired to have a thread cast within one or more of these holes, or to have an outside thread on the casting, these can also be produced on the pressure die casting machine. Castings weighing from one ounce to two pounds each are made and when ready to ship they present a finished appearance, sharpness of outline, smoothness of skin and accuracy that is impossible to arrive at by any but the most expensive automatic machines.

It is hardly necessary to point out what a valuable improvement this method of making castings will be to many who use small parts which require accurate machining and on which the expense of this work is frequently very high, this expense is saved and the manufacturer has the advantage of getting parts which are finished ready for assembling when they come from the foundry.

Such manufacturers as those who make phonographs, typewriters, prepayment gas meters, cream separator castings, adding machines, prepayment weighing and other machines of similar nature have found this method of making their parts of great value. Where threading is necessary it may be cut afterwards, but perfect gears and threads are made by the pressure die casting machine. The strength of the metal varies with the alloy specified, some mixtures giving castings stronger than malleable iron.

It will be apparent from the above description that where anyone has occasion to use a large quantity, say one thousand castings of a similar kind, upon which the machining cost is excessive and which weigh within the capacity of the pressure die mold machine, the system mentioned will be of great value.

LARGE CASTINGS.

The largest casting ever made in Ingersoll was poured successfully recently at the foundry of the Reid Foundry & Machine Co., Ltd. The order was secured by Mr. Reid from the Canadian General Electric Co., Ltd., Toronto.

The casting is 9 feet 7½ inches in diameter by 16 inches wide and 8 inches deep at the rib, and weighs 3,600 pounds.

Manufacture of Standard Railway Car Wheels

Modern Equipment at the Works of the Canada Car Co., Montreal—Whiting Instalation Includes Cupolas, Cupola Charging Machines, Tracks, Etc.

The stresses and strains that the car wheels of to-day have to undergo are very severe, owing to the increased rate of locomotion and the increase in the size and capacity of the cars themselves. It is only natural, therefore, that the making of the wheels should be most carefully scrutinized and the product thoroughly tested before being put into use.

The following is a brief description of the evolution of a car wheel in the shops of the Canada Car Company, Montreal. These shops have been equipped by the Whiting Foundry Equipment Co., Harvey, Ill.

Fig. 1—General View of Wheel Foundry Floor.

In the charging room are the scales, upon which the various ingredients of the charge are proportioned by weight. These scales have nine beams, each one set to the corresponding weight of the different metals to be employed in the mixture. For instance, No. 1 beam shows tare of the car; No. 2 shows weight of pig iron; No. 3, the weight of cast scrap, and so on, so that the weighing is greatly facilitated. From there the cars are run into the cupola room and hoisted to the level of the charging floor.

Fig. 2—Wheel Pits and Pitting Crane.

In running a day's heat there is a test piece, 6in. by 1½ in. by 2 in., taken every ten wheels' run, and these test pieces are examined for the presence of silicon, manganese, phosphorus and sulphur, The allowable amount of each of these being; Silicon, 0.65 to 0.70 per cent.; manganese, 0.45 to 0.52; phosphorus under 0.3, and sulphur under 0.015 per cent. Test pieces are also run, one from the first part of the heat, one from every third tap, and one from the last tap. These are 24 in. by 1¼ in. by 1¼ in., and are tested for breaking strength. The distance between supports is 24 ins., and the breaking load applied at the centre should be 3,300 to 4,500 pounds.

Pouring.

For the wheel department there are two cupolas, each having a capacity of 22 tons hourly. These cupolas supply stationary ladles, which are mechanically turned on their trunions by an operator situated on a platform commanding a view of the whole shop. This operator also controls the smaller ladles that carry the molten iron to the molds. These are placed on trucks that run on rails across the ends of the different lines of molds. The cars are hauled back and forth by means of a cable and the cars are spaced so that when their ladles have been filled and they are moved into position, there is a ladle at the end of each line of wheel molds, directly under a crane that runs the entire length of the molds. These cranes are operated from the ground by wires running the length of the shop just clear of a man's head, so that a man at any mold can operate the crane from where he stands. There are two men to each of these smaller ladles which hold just enough to pour one wheel.

Fig. 3—Drop Test Machine

There are ten wheels poured from each tap, and these are allowed to remain in

the molds from eighteen to twenty-two minutes. Then the wheels are taken to the annealing pits, (Fig. 2), where they are left for six days. From there they go to the cleaning room floor, where one day is allowed for them to completely cool. They are cleaned by wire brushes or sand blast and all cores removed, etc.

Mating, Testing, Etc.

After being thoroughly cleaned each wheel is "taped" or mated, and very carefully examined for any surface defects. The normal 33-inch wheel is 103.67 inches in circumference at the tread and the size of the chill is such that the depth of the chilled metal will be about $\frac{5}{8}$-in. deep when the wheel is of normal diameter. Number 3 tape or class is the normal size and it is obvious that the deeper the chill the smaller the circumference or tape, on account of greater contraction of the tread. The M.C.B. specifications allow a deflection of 3-32-inch either way from the normal circumference of 103.67 inches.

Those wheels found with surface defects or too small or too large taping are rejected and remelted. One wheel is selected from each of the different taped sizes representing the day's cast, and taken to the test drop (Fig. 3) to be tested for physical defects. The wheel is suspended on three points in a central position under the drop. This drop weighs 200 pounds, hoisted by compressed air but falling free. A 600-pound wheel must stand 12 blows of this drop falling from a distance of 12 feet, without breaking to destruction. After each wheel is broken the condition of the metal in the break and the depth of chill noted. If the wheel shows too much chill, that is, over 1 inch deep, it is rejected regardless of breaking strength. If the chill is too small, under $\frac{3}{8}$-in. deep, it is rejected, and the wheels from this day's cast of this "tape" are all rejected.

Some railways do not like the drop test, but prefer the thermo test. In the latter a wheel is set flange down and perfectly level. Then a channel way $1\frac{1}{2}$ in. wide by 4 in. deep is formed around the circumference and this is poured full of molten metal. The wheel should stand this test for two minutes without showing any breaks or cracks, that is, the web or plate must be strong enough to counteract the rapid expansion of the tread caused by contact with the hot metal.

Another test is a drop test of 50 lbs. falling 12 feet, and striking on the single plate of the wheel between the tread and the double plate.

The wheels are then taken to the machine shop, bored out and pressed on to the axles at a pressure of about 40 to 60 tons, the M.C.B. specifications state "not less than 35 and not more than 60 tons."

The life of a car wheel is figured in mileage and should be about 70,000 miles. Frequently the wheels stand 180, 190 and as high as 200 blows of the 200-pound drop before breaking.

Foundry Machinery—Molding Machines, Flasks, Mills, Etc.

Extract of Report of Committee of Stove Founders' National Defence Association on Foundry Machinery—Descriptions are Here Given of Molding Machines and Patterns, with Costs and Conclusions Arrived At.

The committee pursued its investigations by correspondence and by personal visits to the following places ; Toronto, Ont.; Philadelphia, Cleveland, Detroit, Dowagiac, Chicago, Freeport, St. Louis, Newark, Syracuse and Utica. In and about these places many foundries were visited and many men interviewed, including a number of molding machine manufacturers.

The conditions most favorable to greatest success with molding machinery are : Patterns of a size and shape that can be successfully made on the machines now on the market. long runs on the same patterns, co-operation of operatives in securing maximum output from the machines.

Squeezers.

For such work as is ordinarily made on the bench a choice of widest variety is offered running from the simple squeezer, costing about $40, to the complicated automatic machines, costing upwards of $1,500.

In squeezers, the inherent time saving operation is the pressing of the mold. The maximum output may be gained by the use of a double-faced match plate and pneumatic rapper. This outfit, simple and inexpensive as it is, may effect a saving over bench work of one-fifth to one-third. We are also advised by the manufacturers that stripper jobs may be made on squeezers and the change from matchplate to stripper effected in two minutes. Double face aluminum matchplates made of two parts aluminum to one part zinc ought not to average over $10 in cost.

The squeezer with duplex matchplate is an elaboration of the simple squeezer and includes a number of special features. The distinctive feature and the one which mainly accounts for the large output that may be secured from this machine is the placing side by side of both cope and drag, which are both filled with sand and tucked while the molder has his shovel in hand and before he lays it down. Examples of large outputs are 250, 10x19-in. molds in less than seven hours molding time and in the same time 220 molds of 8-in. covers, two in a mold. It is claimed that the attachment of a pneumatic rapper increases the capacity of this machine and it may be so equipped. The examples of a day's work named above, however, were produced without the pneumatic rapper. The cost of match plates for one set of patterns is from $22 to $60. $22 to $30 is the usual cost when self-made and $50 is the usual charge made by the manufacturer of the machine. In places where these machines are in use we found it regarded as good practice to match plate for this machine any patterns of which 1,000 or more molds per year were to be made.

We found some application of small work in the stripping plate type of machine, but in most cases it seemed to the committee that a more favorable result could be secured with small work in applying it to the squeezer type just named. The stripping plate machine finds a more logical and profitable application for larger work, with barrel flasks where hand ramming is used.

We observed very few of these machines in use under what seemed to us the most favorable conditions and hence are unable to state from our own observation what may be expected of them. There appears no reason, however, why together, with the simple squeezer, this machine should not find a more extended introduction into stove shops. They have the advantage that the pattern rigging best adapted to the machines is likewise best adapted to the bench.

Automatic Machines.

The full automatic machine in perfect order is probably capable of producing molds at less cost than any other type

of machine. It has the advantage of being able to produce in a very short time a very large number of castings from one set of patterns. We had no opportunity of noting carefully the range of work of which such machines are capable, but it is not likely that this machine can be depended upon outside of the range of flat or shallow work. There is a wide field of usefulness for automatic machines and any lack of reliability or endurance of past machines will no doubt be largely overcome in the future development of this type.

The machine used in multiple molding is a power-ramming machine. This method has so far been applied only to heavy work of small area. Since the impress of both the cope and the drag pattern are rammed into the same half-flask at the same time, this forms a very quick method of molding. It has the advantage of requiring small floor space, since five complete molds and sometimes more, rest in the space of one. With an air hoist operating over the molding floor a bull ladle brought to the floor on a trolley is used to pour off and the molds shaken out by the hoist. It becomes easy in this manner to handle cheaply and easily a large amount of sand and iron. This method of molding, handling iron, flasks and sand, probably reduces molding costs lower than anything else that we saw.

We observed hand ramming stripping plate machines in use on work such as fire-pots, oven burners for gas ranges, boiler sections, etc. It seems to find its best application on the large work such as boiler sections. It also has its application on deeper work.

The hand ramming rock-over drop table machines seem to be adapted to any flat work, requiring barred flasks. We saw it used for making end shelves, gas stove tops, etc. This machine is also designed for making work of considerable depth. We found fire-pots being made, the cope on a rock-over drop table machine, the drag on a stripping plate machine.

The gravity molding machine is a patented machine and method and was under our observation only in demonstration. In other lines of work it is said to be giving good satisfaction and giving a large output. It is unique in being the one machine that gives promise of doing away with hand ramming on barred flasks.

Two match plate and hinge devices came under our observation, one being used in connection with iron flasks, the other being used in connection with the ordinary flask now in use in any foundry. The latter consists of a simple hinge which may be attached to any wooden flask and it is so constructed that the two parts of the flask with the match plate between them may be rammed up together, or in the case of large flasks the matchplate supported by a frame during the ramming of the first half, and first the cope rolled off on the hinge, then the match plate rolled off and the cope rolled back on again in the hinge and the flask thus closed.

Deep Work.

The power jar or jolt ramming type of machine is particularly designed for work in which the ramming is a large factor such as fire-pots, etc. It is likewise said to be successfully used for steam and hot water boiler sections.

One foot-power jolt ramming and pressing machine seems to be very well adapted to making deep work of small size in snap flasks. It is similar to the squeezer type with duplex match-plates and pattern drawing mechanism above mentioned. In addition to the pressing mechanism it has a foot-jarring mechanism for ramming which makes it possible to ram deep work successfully and does away with the necessity for tucking. We saw some oven door spring caps made on this machine that had been previously made on the floor. In the machine the use of gaggers which had been used on the floor was done away with and the output more than doubled.

This concludes a general review of the committee's observations concerning the different classes of molding machines and devices in use on stove plate work and the character of work which they are best designed to handle. It will be observed that the small work, such as can be made in snap flasks up to 400 square inches in area, offers the widest range of choice of apparatus and that the apparatus which may be used for making this class of work reduces the requirements for molding skill and the hand work performed by the molder to a minimum. On work of larger area the demands upon the skill of the molder are greatest and it would be reasonable to argue that the use of so simple a device as a hinge flask and matchplate would be an insufficient substitute for years of apprenticeship to the trade.

Long Runs on Same Patterns.

How many pieces must be made per year to make it pay to use the machine?

In one shop where this question was asked in reference to the patterns of larger area made on hand ramming rock-over machines we were told that it would pay to put a pattern on the machine in the cheapest possible manner when only 200 or 300 castings were to be made. With larger quantities of 1,000 or upwards to make it pays to use the most perfect and expensive rig. With regard to the duplex match-plate squeezer type where a set of patterns costs from $22 up to $60, we learn from a number of users that it generally required the making of 800 to 1,000 molds to make it pay to rig up the patterns. By comparing patterns and prices of work you propose to rig for machine molding with similar patterns, and their molding prices when made by the method proposed, the reduction in molding price may be foretold, so that you may with sufficient accuracy forecast the total saving in molding cost in making the required number of castings. In this manner and after giving due consideration to other minor factors, the advisability of matchplating patterns may be definitely determined for each separate pattern, and the number required to make it pay. It may be added that when new patterns are being match-plated no follow boards are required and the cost of making them may be figured against the cost of the match plates.

The simplest type of hand molding press without pneumatic rapper may be purchased for about $40.

Other types of hand presses which have the roll-over feature and mechanical hand draft may be purchased for $200 to $300 each. The more elaborate power machines cost from $400 up.

The cost of patterns placed on the machines ready for use is from $10 to $60 each, according to the material used, size and shape of patterns, and style of pattern plates. Where stripping plate machines are used, this question is best answered for each pattern by the molding machine manufacturer.

The output of any machine will, of course, vary with the type of machine, size, weight and style of patterns and pattern rigging and the molding price, of course, will vary with the output. The reduction in molding cost will vary from 30 to 50 per cent. This is, of course, a general statement and wide variations will be found. We have noted cases in which the reduction from bench prices amounted to little more than 20 per cent., while in other cases the reduction was almost two-thirds of the floor or bench price. In foundries where equipment and methods are poor, well adapted machines and pattern equipment have the opportunity for realizing greater savings than in shops where the floor and bench equipment is first-class and the maximum output according to the methods now in use is already secured. The figures above named are meant to be comparative of the best results of both the old floor or bench methods and the new machine methods, i.e., they are meant to represent the labor saving ability inherent in the use of the various forms of molding machinery on the usual run of stove plate work.

(Continued in February Issue.)

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shops.

The new factory of the Evans Co., at Sudbury, is nearing completion.

A $17,000 addition will be built to the Canadian Foundry Co. at Fort William.

An addition has been built to the P. L. Robertson Co.'s machine shop, Milton.

Louis H. Bacque, Montreal, has been appointed Canadian agent for the Baillot cupola.

The C.N.R. may build repair shops in the suburbs of Quebec. The shops would cost $200,000.

The R. Watts Machine Works, Ridgetown, is enlarging by the erection of a new molding shop.

The Madison Williams Foundry, Lindsay, has been filling many orders for mill plants, and a couple of water wheels.

The Garrie-Brook Mfg. Co., will build a foundry in Pembroke, to make all kinds of grey and malleable iron castings.

The Angus shops, Montreal, are turning out twenty freight cars a day. The construction of new locomotives has also been resumed.

About $900 damage was done by a fire which broke out in the D. J. Johnston & Co. brass foundry, Toronto. The building was damaged to the extent of $400 and the contents about $500.

The Expanded Metal Company, Toronto, have been awarded the general contract for a plant to be erected at Port Perry, Ont., for the Weber Gas Company, Janes Building, Toronto.

The Garrie-Brook Mfg. Co. will build a foundry at Pembroke for the making of all kinds of grey and malleable iron castings, and a patent crane run either by oil fuse or gasolene.

The C.N.R. has placed an order with the Rhodes, Curry Co., of Amherst, N.S., for one thousand box cars, which, with passenger equipment, will aggregate eleven hundred thousand dollars.

W. J. McLaughlin, Milford, Conn., a molder and employe of the Ontario Iron & Steel Co., Welland, was very seriously injured by a block falling from an overhead crane. His skull was fractured.

A. F. Johnson, Paris, Texas, has addressed a letter to officials of the Grand Trunk Pacific in Winnipeg, with reference to the establishment of a factory in western Canada for the production of shovel handles.

The Mac Machine Co., of Belleville, have received an offer to go to Orillia, but will remain in Belleville, providing that city grants exemption from taxation and free power for four months each year.

Boyd & Company, Huntingdon, Que., are erecting a foundry in connection with their machine shop there. This firm manufactures hay presses, threshing machines, etc., besides doing a general repair business.

Representatives of the American Car & Foundry Company, Buffalo, have been in Hamilton looking for a site on which to establish a Canadian branch. It is practically settled that the firm will commence operations there.

Howard & Cohen, stove manufacturers, Morrisburg, Ont., are moving their business to Valleyfield, Que. They are busy erecting new buildings in the latter place, and will commence manufacturing within a few weeks.

The Erie Evaporating Company, of Dunnville, Ont., will erect a $10,000 evaporator at Winger, Ont. The building will be two stories in height, of brick construction, with cement foundation, felt roof, natural gas heating.

Canadian Gas Power & Launches, whose Chatham plant was formerly the Defiance Iron Works, announce that they have decided to enter the field of general jobbing and repair work in both foundry and machine departments.

The report that the Otis-Fensom Elevator Co. were thinking of leaving Hamilton for Toronto is denied. The firm are, however, considering the erection in Toronto of a big iron foundry to make castings for other firms, as well as their own.

The Anchor Screw Co. have secured a plant at Toronto West, where they will manufacture patent screw-nails, etc. Machines for their manufacture are now being constructed. A Fairbanks Morse 50 h.p. suction gas producer has been installed.

The Chatham-Electro Plating Works is a new concern which has just opened an office and started in business at Chatham. P. W. Burk and G. R. Speed are the men behind the concern, which does all kinds of gold, silver and nickel electro-plating.

The Lunenburg Foundry Company have completed a splendid gasolene engine. This is the first engine of its kind ever turned out of a county factory. The company are having patterns made for a 3 h.p. engine and will put out engines from 3 to 18 h.p.

The new premises for the Louden Machinery Company, Guelph, are almost ready for them to move in. The Aspinwall Machinery Company in their turn are apparently almost ready to move into the old drill shed at present occupied by the Louden Company.

The Henderson Roller Bearings has recently moved its plant from Niagara Falls to 109 Niagara Street, Toronto, where they have secured a factory of three floors of about 100 feet by 40 feet, and are now doing a very satisfactory and profitable business. Their machinery is largely automatic.

St. John, N.B., is likely to have a new industry. Stewart & Pazzant, two expert molders, at present employed with the Seaside Foundry Co., of Plymouth, Mass., are contemplating the opening of shops in this city for the manufacture of small steel castings. Both men formerly lived in St. John. It is understood they will open a foundry in the spring.

St. Clair Bros., Galt, Ont., are erecting new machine and blacksmith shops to give them better facilities for handling a larger line of work. The machine shop will be 50x100 feet, and the forge shop 30x30 feet, both constructed of concrete. New forging equipment will be added and they expect that their new premises will be ready about February, 1909.

The Marine & General Engineering Company, of Sydney, have moved into the plant at Kings Road, considerable machinery from the Coxheath Copper Mine. Some of the machinery of the sawmill there has also been transferred to the Engineering Company's plant, and a quantity of the mine apparatus will be stored at Coxheath until it is required.

The Vancouver Machinery Depot, Limited, have recently received one of the largest orders for logging engines ever given in B. C. This consists of two 13x14-inch Washington yarders, the largest in the province; two 12x12-inch compound geared Washington yarders, and four 10½x10½-inch compound geared Washington yarders; all to be delivered by the first of April.

H. C. Burchell, general manager of the Sydney Cement Company, who has just returned from a visit to Amherst, says that the industries in that town are all booming. The Rhodes Curry Company have sufficient orders on hand to keep the plant running for a year, and the prospects are bright for a busy season for the Robb Engineering Company and the Amherst Foundry Company.

The Vancouver branch of H. W. Petrie, Ltd., recently received and unloaded two cars of machinery, amounting in all to 30 tons. This company have also through their Vancouver office received an order for the entire equipment of the new planing mill and sash and door factory for J. D. McDonald, of North Vancouver. They are also supplying a new 24-inch planer to Andrews & Donaldson, carriage builders, of Nanaimo, and a new 10x10-inch Dutton 50 h.p. engine to the Port Hammond Lumber Company, of Port Hammond, B.C.

The Canada Zinc Works, at Nelson, where an experimental run has been going on for some time, started out recently on a regular reduction run, the initial run having proved entirely satisfactory. The successful starting of the new Zinc Reduction Works means a great deal for the mining industry in the Kootenay. The electrical process of treating ore, which contained 40 per cent. zinc, 10 per cent. lead and 12 oz. in silver, with 1-5 per cent. copper has proved a success. The process is the first of the kind in Canada turning out spelter, silver, lead, bouillon and copper matte.

The Rhodes-Curry Company, Amherst, have orders on hand for railway equipment totalling over one million dollars. They have just closed an order for one thousand box cars for the Canadian Northern Railway. This order will keep the works running to fullest capacity for some time. Recently the company's car-erecting shops, together with eighteen cars, were completely destroyed by fire, causing a loss of $100,000, and throwing one hundred men out of employment. These mechanics lost all their tools, the kits being valued at from $50 to $200 each. The company will rebuild the shops at once.

A. St. Johns and A. R. Crocker, both experienced machinists of St. Catharines, have opened up the foundry owned by Henry Sewrey. Since the Dyment foundry was burned in 1906, all endeavors of the different councils to arrive at some basis of conciliation with Simon Dyment, who owns the foundry, proved futile. He wanted a bonus from the town of $20,000, payable back in yearly instalments of $1,000. A by-law was twice submitted to the electors, and both times the majority fell short of the required one. The foundry, which was rebuilt soon after the fire, still remains with the windows boarded up.

W. J. Copp, a member of the old stove firm of Copp Brothers, Hamilton, died suddenly recently. He was well known throughout Canada, and before engaging in the stove business carried on a hardware and tinware business in Hamilton, in company with his brother Anthony. They also conducted a foundry business in Woodstock for a time. He had an interest in the stove manufacturing concern of W. J. Copp, Son & Company, of Fort William. The business is at present being carried on by his son, Harold Copp. Mr. Copp was at one time president of the Canadian Stove Manufacturers' Association.

Municipal Enterprises.

Ladysmith, B.C., will have a sewerage system to cost $50,000.

Toronto waterworks will, it is expected, yield a surplus this year of about $50,000.

The council of Revelstoke will spend $10,000 to complete the civic power and light plant.

The town of Hawkesbury, Ont., will spend $30,000 on a waterworks and sewage system.

The British Columbia Electric Railway have inaugurated an electric lighting service at Chilliwack.

A by-law to raise $15,000 for street improvements will be submitted to the ratepayers of Almonte.

It has been decided to submit a by-law in January next in Hamilton to raise $65,000 for sewer extensions and $500,000 for good roads.

Stratford ratepayers will vote on a by-law to take 1,000 horse-power from the Hydro-Electric Power Commission at $27.10 per horse power.

Peterboro ratepayers will vote on a by-law to expend $50,000 for the erection of a new bridge across the Otonabee river at Smith St.

As the contract between the Montreal Light, Heat & Power Co. has expired, Mayor Payette favors a municipal plant to supply Montreal's street lights.

Pembroke council may submit a by-law to the electors to either instal a new intake pipe at a cost of $50,000 or to have slow sand filtering at a cost of $90,000.

A by-law to [illegible] for the erection and equipment of public swimming baths in London will be submitted to the ratepayers on January 4.

The Canadian Electric and Water Power Co have issued a writ against the town of Perth, Ont., for $3,000 for hydrant rental for 1905-6-7. The town will fight the action.

The sewage disposal plant of Toronto will be pushed ahead with all possible speed. A site has been decided upon and the general scheme for the tanks has been arranged.

A new water system is being installed by the G.T.P. in Prince Rupert, as the old mains were found to be too small. A reservoir of 50,000 gallons is being erected back of the town.

London ratepayers will vote on a scheme to increase the water supply of the city by 1,500,000 gallons daily by taking in springs and erecting a pumping station at a total outlay of $441,000.

Vernon, B.C., council have decided to spend $25,000 on the B. X. Creek water supply. Reports were received from John Galt, C.E., and Messrs. Meredith & Tracy, estimating the Long Lake scheme to cost $96,000.

Owing to the scarcity of water, Fort William has asked the Ontario Government to give the Kaministiquia Power Co., which has a concession at Kakabeka Falls, permission to conserve the waters of several streams running into the Kaministiquia river.

At the London municipal elections in January the ratepayers will probably vote on a by-law to raise $441,000 to carry out a scheme of the Water Commissioners for the increase of the water supply. The plan includes the taking in of the Kilworth supply at a cost of $125,000. It is proposed to erect a pumping station in the north end of the city.

In Victoria, B.C., neither of the tenders for the two pumps for the salt water high pressure system was quite in order, as both ignored the city specifications wholly or in part and substituted their own. The tenders were put in by R. P. Rithet & Co., who offered to supply the pumps for $20,590, and the Victoria Machinery Depot Company, for $18,180.

Pembroke ratepayers carried a by-law to ratify a contract with the Pembroke Electric Co. The corporation are now empowered to raise the sum of $10,000 for the purpose of installing an electric pump, 200 horse-power motor and the necessary trip-valve for the stand-pipe. The contract with the Pembroke Electric Light Company covers a period of ten years.

To Verdun belongs the distinction of having the first municipal water filter plant on the Island of Montreal, and in a few weeks the new town will be supplied with filtered water for all purposes. Water is taken at a distance of 1,000 feet from the shore, in the main current, and runs by gravitation into a large steel well, from which it is pumped and filtered.

Under municipal ownership the charges for electric light in Orillia have been reduced as follows: For stores, from 28c to 18c per lamp a month; for houses, from 20c to 18c a month. This is for 24-hour power every day. Last year there was a profit of $10,000 after meeting all charges, which was applied to the reduction of taxes. Even with the reduced cost of light to consumers this year, it is expected that there will be the same surplus, as 1,000 new lights have been installed in the past three months. Under private ownership the cost of lighting was about 35c per lamp.

Railway Construction.

The C.N.R. has seven miles of track laid on its new line from Calgary to Saskatoon.

The Canadian Northern may be extended north from Macleod's pit to Brant, in Stonewall district.

An electric railway line is likely to be built from Calgary to Milverville, a distance of 28 miles.

An electric railway line is proposed between Woodstock, and Guelph, by way of Innerkip, Bright, Baden and Berlin.

The G.T.R. has recently placed an order with the Pressed Steel Car Co., of New York, for 1,000 steel hopper coal cars.

It is likely that construction will be started at an early date upon the projected Alberta Central Railway, from Red Deer, Alta., westerly to the Rocky Mountains, about 70 miles.

A radial railway is proposed from Tillsonburg to London, with branch lines to Port Boswell, Aylmer and other points, for a charter for which application will be made at next session of Parliament.

Application will be made at the next session of the B.C. Legislature for an act to incorporate a company to construct and operate a 40-mile steam or electric railroad from Corbin to the international boundary.

Mr. Wm. Mackenzie says that in the future not far distant he expects an electric railway to be constructed on the right of way of the Toronto & Niagara Power Company's transmission line, which line will connect Niagara Falls direct with Toronto.

Notice is given that the Canadian Pacific and Grand Trunk Pacific Railway Companies will apply at the coming session of Parliament for an act to ratify the agreement, dated the first of December, providing for joint terminal facilities at Fort William.

The Lindsay Construction Company have completed their contract with the Dominion Coal Co. for the construction of the branch railway from Grand Lake to Waterford, and the grading about collieries Nos. 10 and 12.

The Grand Trunk Pacific Railway has decided to at once erect ten station buildings at various points along the line where depots have not as yet been provided. Tenders for these buildings will be called for in the near future.

Alberta will create a new department of government—that of a Department of Railways, which will pursue a vigorous policy of railway extension for the purpose of developing the province. The province will build its own railways.

J. H. Tremblay, St. Boniface, Man., has been awarded the contract for the two large freight sheds to be erected near the Union Depot, Winnipeg, in the C.N.R. yards, for the joint use of the Grand Trunk Pacific and the Canadian Northern, at a contract price of $92,749.

The Canadian Western Railway Co. will make application at the next session of Parliament for articles of incorporation for the purpose of constructing, equipping, maintaining and operating a railway system in the western portion of Canada.

The Temiskaming and Northern Ontario Railway is now practically completed from North Bay to Lake Abitibi. A railway is now being sought to Gow Ganda Lake, and the suggestion has been made that the Canadian Northern should be extended between Sudbury and Gow Ganda Lake.

The Grand Trunk Railway is contemplating the instalation of a block system on the main line from Montreal to Sarnia, and also from Sarnia to Chicago. It is believed that the work will be started in the spring, and will cost about $1,350,000 for the 900 miles of track.

Tenders were recently opened by J. Oakley, chairman of street railway committee for the construction of the street railway car barn and machine shop for the City of Fort William. The buildings will be of brick and reinforced concrete, with steel roof trusses, and will cost $30,000.

The contract for the construction of new carshops, etc., for the Winnipeg terminals of the National Transcontinental Railway, has been awarded to Messrs. Thomas Kelly & Sons, of Winnipeg. The work, which calls for the expenditure of about $500,000, will be commenced at once.

The Canadian, Liverpool and Western Railway is seeking legislation to construct a railway from a point on the National Transcontinental Railway, near the St. Maurice River, in Quebec, to Lake St. John, and along the Saguenay to its mouth; also a line extending to Quebec and Montreal.

The Smith's Falls Board of Trade and Council have been in consultation with the C.P.R. officials in regard to the building of shops in Smith's Falls. Recently a roundhouse to hold 23 engines and a large machine shop were completed. It is now proposed to build shops at this divisional point, giving employment to several hundred men.

Application will be made to the Government for a charter for an electric belt line from this city to Morrisburg, westward to Brockville, through Darling to connect with the North Lanark steam railway from Ottawa to Darling now being constructed. The proposed line would cover 143 miles and the estimated cost would be $14,000 per mile, or $2,002,000 for the whole undertaking.

The National Transcontinental Railway Commission has signed the last contract to be let for the construction of the whole road from Moncton to Winnipeg. The last division turned over to the contractors is a stretch of 204 miles through the clay belt of New Ontario, beginning at a point ten miles west of Lake Abitibi and running westwards towards Lake Nepigon. The contract went to the lowest tenderers, Messrs. M. P. and W. H. Davis.

Good progress has been made by the Grand Trunk Pacific during the construction season, which is now closing. During the past summer track has been laid from Port Arthur to Superior Junction, 200 miles, and from Winnipeg to Battle River, 666 miles. Grading has also been done on the prairie section as far as Wolfe Creek, 129 miles west of Edmonton, and 910 miles west of Winnipeg. Soon the Clover Bar and Battle River bridges will be completed, and trains will then be able to haul steel for the Saskatoon to Edmonton part of the line. It is hoped that the whole stretch of track from Winnipeg to Edmonton will be opened for traffic early next summer. By next fall it is expected that the G.T.P. will have altogether some 1,200 miles in operation.

The Canadian Northern has bought the Duluth, Rainy River & Winnipeg road for $6,000,000, which gives Mackenzie & Mann complete direction of a line that will connect Duluth with Winnipeg. "The Canadian Northern," said Mr. Mann recently, "now controls the logging road formerly owned by the Virginia Lumber Company, which brings the road within seventy miles of Duluth. The Canadian Northern can enter that city at any time it seems advisable. The logging road extends to Fort Frances and is 93 miles long." Mr. Mann added, "The end of the current fiscal year will find us with about two hundred and fifty miles of new road. The Canadian Northern adds about three hundred miles to its system every year. It builds just so much road as can earn its fixed charges; this is the safety check to our extension."

Electrical Notes.

The Western Electric Company has opened an office in Fort William.

The Electric Light Co., Okotoks, Alta., are erecting a building and instaling machinery at a cost of $10,000.

The Dufferin Light & Power Company have completed building their transmission line from the Huxtable Roller Mill to Shelburne.

Archie L. Simmie, of London, is engaged in installing a 500 horse-power engine in the plant of the McKinley-Darragh-Savage Mining Co., Cobalt.

A contract has been let by the British Columbia Electric Railway Company for the manufacture of 150,000 ties to be used in the construction of the Cloverdale-Chilliwack section between Vancouver and Cloverdale.

The Hydro-Electric Power Commission's agreement with Toronto promises to deliver power to Toronto by December 19, 1909, and K. L. Atkin, engineer in charge of the city's distribution plant, says the transmission line should be completed by that time.

A deputation from Belleville recently waited upon the Ontario Government in regard to improving the Moira river's natural reservoirs in order to provide electric power for Belleville, Tweed, Madoc and other towns. Concrete dams at various lakes may be built, at a cost of $35,000, to preserve the natural flow.

The electric locomotive, which was fitted up at the Canadian General Electric Works, Peterboro, with motors, etc., has left the shop and has been taken to Shawinigan Falls, Quebec. It has two trolleys when in operation, and there are four motors that provide power. Two men are required to operate it, and it travels at a speed estimated at 30 miles per hour with 30 freight cars as a load.

It is expected that Peterboro will shortly approach the Hydro-Electric Power Commission with regard to power. It is proposed to obtain this if possible from sources about twenty miles north of the city, and have practically the same plan worked out as at Ottawa. Failing in this, however, the commission may be asked to bring Niagara power to Peterboro. It is thought that perhaps 8,000 horse-power may be used annually.

The Ontario Power Co., Niagara Falls, contemplates the construction of another pipe line from the gate house at the Dufferin Islands to the power station at the bottom of the bank, a distance of about three-fourths of a mile. The line will cost about $700,000. This additional pipe line is made necessary because of the contract which the Ontario Power Company has executed with the Hydro-Electric Commission to supply the electric current to the Government transmission line. For some time there has been building a considerable addition to the power house below the bank to accommodate other units. The work of instaling the units and of laying the pipe line will be completed in time for the execution of the Government contract. Under the terms of its charter, the Ontario Power Company may develop 180,000 horsepower. At the present time the company is developing 75,000 horse-power, and the contemplated work will increase the output of the plant to 140,000 horse-power. The company has authority to export to the United States 60,000 horse-power, while at the present time but 30,000 horse-power is exported. The plant now has installed six units, three of 10,000 horse-power. The others, 12,500 units, have proved so satisfactory that the company is changing over the 10,000 units now. The new units which will be installed to develop the additional "head" will all be of the larger class.

Structural Steel.

A new steel bridge has been built across the Conestogo by the G.T.R.

A new steel bridge is being erected on Granville Street, Vancouver.

The Quebec Bridge Co. has become merged with the Federal Department of Railways and Canals and all its belongings transferred to the department.

The New Westminster city council has awarded the contract for the superstructure of Lulu Island bridge to the Canada Foundry Company for $26,831.25.

The new steel bridge at Van Vlack, in Simcoe county, will be 300 feet long, and built on concrete piers and abutments. It will cost about $15,000.

A by-law will be submitted to the people of Toronto in January, 1909, for the proposed expenditure of $215,000 on a bridge across the Don at Wilton Avenue.

A bridge over the Saugeen at a cost of $4,000 is to be built by the Town of Durham, debentures for which were approved by the Ontario Railway Board recently.

Plans have been prepared for the erection of a new concrete railroad bridge on the Owen Sound line, near the waterworks, Stratford. The bridge will in all probability be constructed next year.

A deputation consisting of members of the Edmonton and Strathcona city councils, will ask the Alberta Government to construct a bridge across the Saskatchewan river, similar to the one at Medicine Hat.

The Ontario Railway and Municipal Board has approved a by-law of the Town of Durham, providing for the issue of debentures to the extent of $4,000. The proceeds are to be used to erect a bridge across the Saugeen river.

City Engineer McLean, Strathcona, Alta., has been instructed by the council to prepare plans for a high level bridge over Mill creek, at the eastern extremity of Whyte Avenue, to provide a direct route into Strathcona from the Clover Bar District.

Regarding the proposed new Bathurst Street bridge it was proposed, at a meeting of the Board of Control, Toronto, to pay for this structure out of the taxes, in place of submitting a by-law to the people. In this case tenders would be called for at once. Estimated cost of bridge, $135,000.

Frederic Nicholls, general manager of the Canadian General Electric Company, of Toronto, was in Vancouver last month, and went over to New Westminster, where the tenders for the construction of the bridge from New Westminster to Lulu Island were opened. These tenders were so high that it was found an additional outlay of from $20,000 to $25,000 would be necessary, and the ratepayers will be asked to approve the expenditure of this sum before the contract is finally awarded. Subject to the ratification of the money-by-law, the tenders accepted were that of the International Contract Company, Seattle, for the sub-structure, at $29,642, and of the Canada Foundry Company, for the superstructure, at $26,831.25. The United States Steel Products Company's tender for the superstructure was the lowest, but as it was only $120 less than that of the Canada Foundry Company, it was decided to give the Canadian firm the preference.

Gas Items.

Seattle capitalists may establish a gas plant in North Vancouver.

New Westminster will have a new gas plant. It will cost about $80,000.

Waterford, Ont., is forming a syndicate, and will bore for natural gas.

The Provincial National Gas and Fuel Co. has paid $10,000 for a lease of 5,000 acres of marsh land south of Welland, and will prospect for oil and gas. They are preparing to drill a well to a depth of 3,300 feet.

The new building for the Bridgewater Gas Engine Company, at Bridgewater, has just been completed and the company is now instaling the machinery. The company is starting the operations at once and the first engine will be turned out about the beginning of the year.

A saving of $7,000 will be made this year by Toronto operating the civic gas lighting system. Prior to 1907 the lighting of the streets by gas lamps was let by tender. Since then, under municipal control, the lamplighters have received higher wages and the lights have given better service.

St. Catharines Board of Trade unanimously passed a resolution in favor of the conservation of Canada's natural gas supply, and asking the Governor-in-Council to pass an order prohibiting its exportation to the United States. An effort will be made to enlist co-operation of other municipalities interested in the question, because of a shortage.

The question of the gas producer was discussed by Kamloops council, when Frederick Nicholls, president of the Canada Foundry Co., Ltd., was present. The trouble was that the producer was not adapted to Bankhead coal, and in speaking of the matter, Mr. Nicholls stated that he would not shirk any responsibility. A sample of the fuel had been analyzed, but in some way the company had failed to hit off the exact producer required for that kind of coal. This the company would do, however, even if it cost more than the original figure named in the contract. It would take time and it would be necessary to supply a new producer especially designed to use coal from Bankhead, the cost being about $2,500. This extra expense would be borne by the company, which, in addition, would leave the city in possession of the old producer. Satisfaction was expressed by the city solicitor at the attitude adopted by the company.

Trade Notes.

The Standard Engineering Co., 43 Scott St., Toronto, manufacturers mechanical stokers and steam specialties, have opened a branch office at 234 Coristine Bldg., Montreal.

Jones & Glassco, Montreal, have installed Reynolds chain in the Dominion Wire Co.'s works, Montreal, on their wire-drawing machinery. Three chains transmitting 75, 125 and two 150 h.p. drives have been supplied.

M. E. Casey, for several years with Williams & Wilson, Montreal, has severed his connection with that firm and is now selling agent of the Berlin Machine Works, Hamilton, for the Province of Quebec. His address is 69 Staynor Ave., Westmount.

The Robb Engineering Co., Ltd., of Amherst, N.S., have recently received the following orders from Cobalt, Ont.: 1 30 h.p. Robb-Armstrong vertical engine. For the Colonial Mining Co., 1 75 h.p. Robb-Armstrong vertical engine. For the Temiskaming Mining Co., 2 100 h.p. Robb-Mumford water tube boilers.

The Toronto branch of the Dominion Foundry Supply Company has moved into larger quarters at 20 Pearl Street. The office and warehouse are now under one roof. F. J. Ross is the manager of this branch, which formerly had an office in the Traders Bank building and a warehouse at 122 Wellington St. West.

Quite a large instalation of electric traveling cranes has recently been completed in the plant of the Penn American Plate Glass Co., Alexandria, Ind. There are five 3-motor cranes in all, four being of 65-foot span, and one of 30-foot span. All the cranes were made and installed by the Northern Engineering Works, Detroit, Mich.

The Smart-Turner Machine Co., Ltd., Hamilton, have supplied the Robt. Simpson Co., Toronto, with a pair of their duplex outside-packed plunger pumps, with pot valves. Other companies supplied are, I.C.R., Montreal; Bechtels, Ltd., Waterloo, and G.T.R., Bracebridge. They are instaling a 10-ton electric crane in the I.C.R. shops, River du Loup, Que.

The Dominion Mining Co., Tangier, have contracted with the Canadian Westinghouse Co., for a complete electric power plant including a 500 h.p. generator, motor, switchboards, etc. This plant will be operated from a water power about one mile from the mine, and all their operations such as pumping, hoisting, compressor, etc., will be driven by electric motors at a minimum cost for power and attendance.

The Whiting Foundry Equipment Co. have appointed as agents the United Steel & Equipment Co. Their territory includes British Columbia for the Whiting lines, including cupolas, foundry equipment and air hoists. Gorman, Clancey & Grindley have been appointed agents for Alberta and southeast British Columbia for cranes of various designs, air hoists, cupolas, foundry equipment for cast iron, malleable and steel foundries.

Wm. B. Mason, president, and W. A. Macleod, treasurer, of Mason Regulator Co., Boston, Mass., were in Montreal recently, establishing an eastern Canadian agency for their reducing valves and regulating devices. They appointed Peiler & McKenzie, 17 St. John St. Montreal, eastern Canadian agents. Among the lines handled are reducing valves, damper regulators, pump and elevator pressure regulators, steam engines and pumps.

The water committee of Montreal, at a special meeting, decided to take over the twelve-million-imperial-gallon Worthington steam pump. Very satisfactory duty tests have been made. The pump is designed to work against 93 pounds water pressure with steam at 140 pounds. There are two h.p. cylinders 21 inches in diameter, two i.p. cylinders 33 inches in diameter, and two l.p. cylinders 60 inches in diameter, the stroke is three feet. The water plungers are two in number, double-acting and 29½ inches diameter.

The Hill Electric Switch Company, Limited, 1650 St. Lawrence Boulevard, have been awarded the contract to supply the new Workman building of McGill University with its equipment of main switchboard and panel boards. The panel board and cabinets for the new Eastern Townships Bank building in this city are also being built by the Hill Electric Company.

The Peterborough Lubricating Mfg. Co., Peterborough, have opened a sales and demonstration office at 127 Bay Street, Toronto. The office will be in charge of Alfred Cornwell as sales manager, and a full stock will be carried in Toronto. Fred T. Deville has been engaged as traveling salesman.

Planing Mill News.

A. D. Burrows has put up a planing mill at Eden Mills, Ont.

W. J. Travis is erecting a new planing mill in Wyoming, Ont.

J. W. Milligan is starting an apple barrel plant at Orillia, Ont.

W. E. Walsh has erected a sash and door factory at New Westminster, B.C.

The McMaster Lumber Co., of Kemptville, has decided to erect a new mill in Hull.

The Rowden Manufacturing Company will build a furniture factory in Guelph, Ont.

Brayden & Johnston are starting work erecting a sawmill at Canoe Creek Siding, B.C.

The Cooke Lumber Company, Nelson, B.C., is preparing plans for the erection of a sawmill.

The McMaster Lumber Co., Kemptville, Ont., will erect a large sawmill in Hull in the spring.

The Doak Manufacturing Co. has opened a new planing mill and sash and door factory in Nutana, Sask.

F. A. McCalum's sawmill at Rodney, Ont., has been destroyed by fire. Loss, $5,000, insured for $2,500.

The Empire Lumber Company's planing mill at Latchford, Ont., has been burned, with a loss of $30,000.

Mitchell Bros.' sawmill at Berkeley, Ont., has been burned with a loss of $8,000, and with only small insurance.

The Ross-Taylor Company have added to their planing mill at Exeter, Ont., a branch for the manufacture of boxes.

The planing mill of S. S. Cooper, of Clinton, Ont., was destroyed by fire on Dec. 22. The structure was a total loss.

Stracey & Garland's sawmill and woodworking business at Vancouver has been taken over by the Nimpkish Lake Logging Co., Ltd.

H. G. Bykhouse, Grand Rapids, Mich., has taken over the Humber River Pulp & Lumber Company's timber limits and sawmills at Deer Lake, Newfoundland.

J. W. Lowe & Son's woodworking factory, sawmill and adjoining buildings at Avlesford, N.S., have been totally destroyed by fire. Loss $25,000.

Reports from Buckingham, Pembroke, Aylmer and Braeside show that production of lumber in those towns will equal that of last year, about 75,000,000 feet.

The Baie St. Paul Lumber Company's limits and mills near Beaupre, P.Q., have been sold to an American syndicate, composed of F. A. Kernan, J. B. Coughlin and others, of Utica, N.Y.

Two cut-up mills owned and operated by the Inglewood Pulp & Paper Co., at Musquash, N. B., were destroyed by fire Nov. 27th. The loss is estimated at $22,000, and there was $13,000 insurance.

The Gibbons Lumber Company, at Pingston Creek, B.C., are increasing the capacity of their plant to about 60,000 feet per day, by the instalation of a new Waterous carriage saw frame and edger.

The sum of $150,000 has been expended by J. A. Sayward, Victoria, in adding to and equipping the Sayward mill, which has the most modern plant in the country. The capacity is 250,000 feet per day.

H. E. Ratz has installed in his saw and planing mill at St. Clements, Ont., machinery for manufacturing hoops and staves. He has also purchased the Millbank heading mill and will instal their sawmill machinery.

The Thompson & King Manufacturing Co., Ltd., is the new name of the River Street Boat and Planing Factory, Parry Sound, of which Messrs. Thompson & Griffiths were proprietors. Mr. Griffiths has retired and Frank King has taken his place.

Building Operations.

Vancouver will have a $30,000 isolation hospital.

Montreal will erect a new morgue to cost $15,000.

St. Catharines will erect a new $25,000 public school.

Brantford may build a new $100,000 Collegiate Institute.

The G.T.P. will build a $12,000 station at Wainwright, Sask.

F. A. Bean will erect a $100,000 oatmeal and flour mill in Regina.

The Northern Elevator at Glenboro, N.S., was burned on Dec. 10.

Moose Jaw will build a new fire hall at a cost of $35,000, in the near future.

Work has been commenced on the erection of a new post office in Prince Rupert.

Kirk & Co., manufacturers of aerated waters, will erect a new factory in Victoria.

The Cockshutt Plow Co., of Brantford, will erect a warehouse at Saskatoon in the spring.

[illegible], B.C., will erect a public hall.

[illegible], Ont., will build a Carnegie library.

[illegible] will erect a large new opera house.

[illegible], Ont., is erecting a new public school.

[illegible] school will be erected in Clandeboyne.

The Salvation Army [illegible] build a hospital in [illegible].

[illegible] is thinking of erecting a new Collegiate Institute.

A $6,000 addition has just been added to the [illegible] public school.

A new concrete wharf, 548 feet long, is being built at Lakefield, Ont.

[illegible] of St. John the Evangelist, Lon[illegible] will erect a new building.

The Methodists of Meaford have completed the erection of a fine new church.

Plans for the new Lutheran church to be built in Brantford have been completed.

The new Isolation hospital, London, is nearly [illegible]. The cost of the structure was $7,2[illegible].

The Western Canada Flour Mills Co. will erect a warehouse in Winnipeg at a cost of $[illegible],000.

McCoy & Wilfond have just completed the construction of a $50,000 concrete dam at Bobcaygeon.

The Postum Cereal Co., of Battle Creek, Mich., will locate a Canadian branch factory in Windsor, Ont.

The plant of the Prairie City Oil Company, Winnipeg, which was destroyed by fire recently, will be rebuilt.

The C.P.R. is completing negotiations for the erection in Fort William of the largest coal-handling plant in the world.

A school building will be erected and equipped at Strathcona, at a cost of $50,000, bonds of which have been already marketed.

The Copp, Clark Co., Toronto, will erect a large new factory to accommodate their printing, lithographing and book binding plant.

Chicago and St. Louis capitalists will erect a handsome hotel in Kingston, providing they receive a bonus of $100,000 and a free site.

The Weber Gas Engine Co., Toronto, the Canadian branch of a United States company, have erected a $70,000 plant at Port Perry.

The Dominion Tack & Nail Co. have begun operations in Galt. J. C. Clapp and J. Brough, late of Montreal, are behind the industry.

The Colonial Wood Products Company, Niagara Falls, N.Y., have purchased 20 acres of land at Welland for the erection of a pulp mill.

The Morris Piano Co., whose factory at Listowel was burned recently, will rebuild. The ratepayers will vote on a by-law to loan the company $25,000.

A large storehouse of the Welland Vale Mfg. Co., St. Catharines, makers of hoe, rake, spade and other handles, was destroyed by fire on Dec. 4. The loss is $50,000.

Nelson City Council are negotiating with the Kootenay Motor Company and the Kootenay Steam Company, with a view to their establishing their plants in that city.

It is said that Milltown, N.B., may soon have an immense shoe factory. The Slater Shoe Co., of Montreal, the largest shoe concern in Canada, are negotiating for a site in Milltown, where there is great water power.

The new concrete bridge has been completed at Beckhorn, in Peterboro County. It is 400 feet long and in width is 14 feet clear. The fill beneath the bridge has also been finished. It is built of concrete with reinforced girders.

The Moncton city council is negotiating with the White Candy Company for the removal of their factory from St. John. The council has decided to submit an alternative proposal to grant exemption from taxation, free light, water, etc.

The A. R. Williams Machinery Company has decided to build larger and better quarters in Winnipeg. As a result it has closed a deal which gives it the ownership of a fine site. A new building, containing warehouse space and offices, will be erected.

The Loudon Plow Co., Cambridge, Mass., probably the largest manufacturers of steel plows in the world, will shortly open an agency in London, Ont. The agency, it is understood, will, in a short time, be followed by a branch manufacturing plant in London.

E. D. Smith & Co., Winona, Ont., will double their present plant. Work has already begun on a four-storey building, 90 by 50 feet, and this will be completed next spring. Mr. Smith will extend the scope of his business so as to include the manufacture of preserved fruit in glasses, and possibly unfermented wines.

Two banks and four industrial and commercial concerns will establish branches shortly in Saskatoon. Among the latter are John Deere Plow Company, of Chicago; the J. I. Case Thresher Company, of Hamilton; the Cockshutt Plow Company, of Brantford; the Gray Carriage Company, Chatham; the M. Campbell Fanning Mills Company, of Chatham; the Singer Sewing Machine Company,; the Rat Portage Lumber Company, of Winnipeg; the International Harvester Company.

A new company has been formed in Amherst, N. S., which has bought the patent rights of Joseph Heaton, late of Hampton, N.B., The company purpose manufacturing acetylene generators and other articles in connection with heating. E. A. Chaters, of Sussex, and A. N. Charters, of Moncton, are on the directorate.

The Nova Scotia Carriage Co.'s plant at Kentville, N.S., has been purchased by McKay Bros., of Souris, P.E.I., who carry on quite an extensive business in the same line. They will operate the plant at Kentville after the first of the new year. The latter plant has been closed down for some time.

New Companies Incorporated.

The Wire & Cable Co., a Quebec incorporation, has been granted a license to do business in Ontario.

Oriental Woodwork, Limited, capital $100,000, Toronto; provisional directors, George Wilkie, Grant Cooper and John I. Grover.

Russell Harvesting Machine Co., Woodstock, capital $250,000; provisional directors, Wm. Russell, J. F. Russell and J. T. Burns.

The Standard Valves, Limited; capital, $20,000, Ottawa; provisional directors, Hugh Burnet, Fred W. Musgrove and R. S. Smart.

The Langdon Davies Motors (Canada) Limited, an incorporation under the laws of Great Britain, has been licensed to do business in Ontario.

The Berry Pulverizer Co., capital, $100,000, Ottawa, provisional directors, Patrick H. Wall, Wm. J. Carson, M. W. Merrill and Austin Berry.

The Russell Harvesting Machine Co., capital $250,000, Woodstock, Ont., provisional directors, Wm. Russell, James Franklin Russell and J. T. Burns.

Point Anne Quarries, Limited, capital $500,000, Toronto; provisional directors, M. J. Haney, J. F. M. Stewart, Thos. Gibson, H. T. Hunter and E. P. Seon.

The Consumers' Gas Co., Wallaceburg, capital $40,000, has been incorporated. The provisional directors are David A. Gordon, H. A. Stonehouse and W. W. Hay.

Provincial charters have been granted to Canada Construction & Dredging Co., Ottawa Construction Co., and Union Construction Co. three corporations having Dominion charters.

Victoria Paper & Twine Co., capital $80,000, Toronto; provisional directors, C. F. Hubbs, W. H. Howe, H. J. Severance, R. W. Gallagher, Chas. V. Syrett, C. S. Nicholls and E. R. Mallalieu.

Manufacturers Corundum Co., capital $100,000, head office Toronto, has been granted a provincial charter. The provisional directors are, A. W. Holmested, F. H. Potts and T. A. Silverthorn, Toronto.

Marsh & Henthorn, Limited, capital $100,000, has been incorporated, with head office in Belleville. The company will carry on the foundry and manufacturing business of Marsh & Henthorn, Belleville.

The Ott Brick & Tile Manufacturing Co., capital $40,000, Berlin; provisional directors, Michael Ott, Conrad Ott, Casper Braun, C. Assmussen, R. Bierwagen, H. Potzenroth, R. Pinke and August May.

Merkley Bros., Limited, capital $50,000, Cassel, Man., to carry on a lumber, saw and planing mill business. Provisional directors, Alex. Hugh Merkley, Duncan C. Merkley, Wm. Merkley, Adelard Dorais and Allan C. Gill.

The Advance Machine Works, capital $30,000, Walkerville, has been incorporated. The incorporators are, Georee Albert True, Edward Snover Reid, Frederick Albert Eckert, Henry Winslow Standart and William Van Moore, Detroit.

A provincial charter has just been granted to the Russell Harvesting Machine Co., Ltd., capital $250,000, with headquarters at Woodstock. The provisional directors are Wm. Russell, of Hamilton, and Jas. F. Russell and John T. Burns, now of this city.

The Thompson & King Manufacturing Company, capital $20,000, Parry Sound; to build boats, launches, deal in lumber, builders' supplies, etc.; provisional directors, A. A. Thompson, Edward Thompson, Frank King, Clara Thompson and Thomas Fraser.

Fisher, Robson Manufacturing Co., Alliston, Ont., capital $100,000, has been incorporated. The company will manufacture agricultural implements. Those constituting the company are R. Scott, T. M. Brown, W. A. J. Bell, W. J. Hill and C. S. Fisher, Alliston.

A charter has been granted to the Dain Mfg. Co., Welland, capital $200,000. The company will manufacture farm implements. The applicants for the charter are, J. Dain, P. Ferdinand Arbenz, and F. M. Hunter, Ottumwa, Iowa; B. J. McCormick and L. C. Raymond, Welland, Ont.

Canadian Patents, Limited, have been incorporated, with an authorized capital of $40,000, and head office at Ottawa. The incorporators are: George Hollis Mcgloughlin, William McGee Young, Arthur Nassau Molesworth, Fred William Musgrove, Ottawa, and William Alfred Wyman, Cumming's Bridge.

Letters patent have been issued to Messrs. E. J. Estes, G. S. Hart, F. H. Markey, R. C. Grant and W. G. Pugsley, of Montreal, for the organization of the Canadian Palace Car Co., with a capitalization of $1,500,000, to manufacture in Canada parlor, dining and sleeping cars, on rights obtained from the American Parlor Car Co., of New York.

The Canadian Palace Car Co., of Montreal, has been incorporated, with a capital stock of $1,500,000. The company was originally the American Palace Car Company, which passed into the hands of a receiver some months ago and which was finally absorbed by Canadian interests. The shareholders of the old company in Canada numbered nearly 450, and this will be increased by the formation of the new organization.

Cobourg Rolling Mills.

The main building of the steel rolling mills plant is almost completed, and it is expected that the works will be in operation about March 1st. This is a branch of a Pittsburg steel plate concern and as intimated in the December issue of Canadian Machinery, the main building is 350x80 feet. In addition, a power plant is being built. The machinery will be installed during February and thirty-five hands will be employed. This number will be increased as orders for work warrant it.

Tin Plate Industry.

R. Jenkins, of Swansea, Wales, is organizing the Welland Tin Plate Co., with a capital of $250,000, which will establish an industry in Welland, Ont. A fifteen-acre site will be given to the promoter and the concessions are asked in the form of a fixed assessment of $10,000, and water at cost. In return, four mills, 100x300 are to be built, and 250 men employed. One of the agreements is that Welland is to build 150 houses that will be needed by the workmen, as there are not enough houses in Welland at present.

World's Fair for Winnipeg.

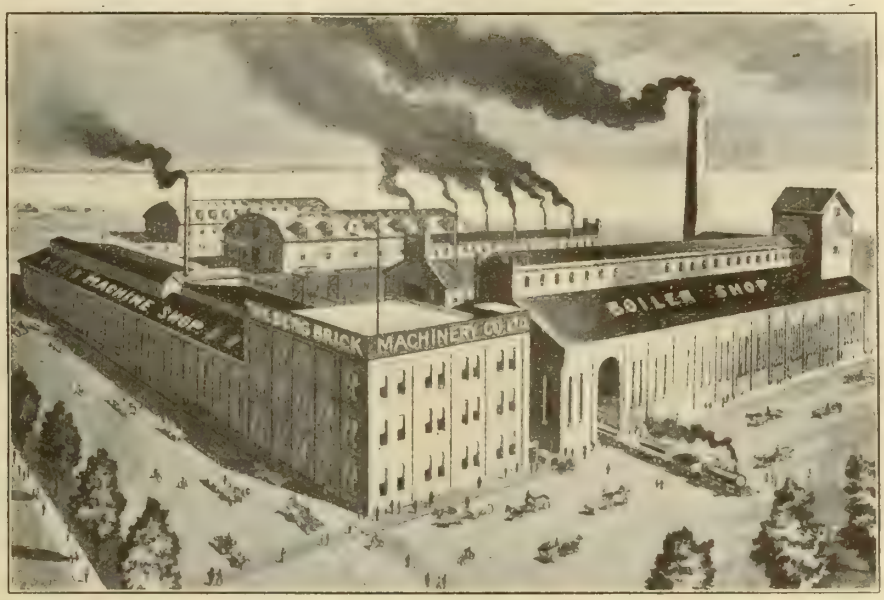
The project of holding a world's fair at Winnipeg in celebration of the landing of Lord Selkirk's settlers is now taking shape. At the annual meetings of several organizations, including the Winnipeg Industrial Exhibition Association, the question was discussed and many practical suggestions offered, as well as substantial financial support in the undertaking. The general opinion throughout western Canada is that the project of holding a world's fair at Winnipeg deserves the encouragement of the Dominion and Provincial Governments, inasmuch as the progress and prosperity of the west would be advantageously exploited.

Handsome Calendar.

The Hamilton Facing Mill Co., Hamilton, have issued a handsome calendar, which contains a picture reproduced in size 10x16 inches from Ernest H. Riggs' picture "Eventide." This was one of the more important canvases at the 1906 London Royal Academy. The beautiful reproduction of nature created much comment in England's foremost exhibition. The picture shows the farmer, the day's work over, unhitching his weary team from the plow which he leaves in the furrow awaiting the coming of another dawn. Then, accompanied by his wife and child, who have come forth to meet him, he plods his weary way homeward to the warm supper and the glowing fire upon the hearth.

THIS GREAT PLANT

CONTAINS EVERY FACILITY FOR THE ECONOMICAL
MANUFACTURE OF HEAVY MACHINERY
IN LARGE QUANTITIES.



It takes an enormous amount of work to keep a plant of this size working full time. Naturally we are ready at all times to undertake large orders for the manufacture of

Light and Heavy Machinery

OF ANY CLASS, IN LARGE QUANTITIES

We are manufacturers of high-grade

BRICK MACHINERY, including the famous Berg Brick Press.
CEMENT MACHINERY, for the manufacture of Portland Cement.
MINING MACHINERY, Crushers, Pulverizers, Concentrators, etc.
ENGINES and **BOILERS.**

Our Plant Includes

a large and completely up-to-date Machine Shop, Foundry, Boiler Shop, Blacksmith Shop, Pattern Shop, Pattern Storage Facilities, etc.

Write us and let us figure on your requirements.

MANUFACTURERS AND MANUFACTURERS' AGENTS.

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

DUPLICATING DEVICES.

IF interested in a Duplicating Machine for getting out circular letters, reports, price-lists, etc., or for printing various office forms, write for booklet and samples of work. The "POLYGRAPH" is the newest, latest and best, and sells for a lower price than the others. Is unexcelled by any similar device on the market. F. W. Tenney, Canadian Sales Agent, 123 Bay St., Room 116 Stair Bldg., Toronto, Canada.

FOUNDRY EQUIPMENT.

WANTED—To purchase or work on royalty, articles relating to modern foundry equipment, which will guarantee economy and a saving of labor over present methods. Forward blue prints or patterns. Address Box 63, CANADIAN MACHINERY, Toronto.

GASOLENE ENGINE CASTINGS.

MARINE gasolene engine castings, with blue prin and full instructions, etc.; 2½, 4, 6 h.p.; also complete finished outfits at $65 up; catalogue, Krug & Crosby, Hamilton. [10tf]

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room, or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

MACHINERY FOR SALE.

FOR SALE, at considerably less than cost, a new Campbell Oil Engine, eight horsepower working load, electric lighting type, cheapest source of power for small factory. Jones & Glassco, Montreal.

METALLIC PACKING.

MANUFACTURE METALLIC PACKING—On receipt of three dollars we will send printed illustrated formula for making Plastic Metallic Packing for steam, water, air, gas, hydraulic machines, valves, etc. Address, Ideal Metallic Packing Co., South Stillwater, Minn., U.S.A.]12]

TO INVESTORS.

ONE of the progressive Western contracting companies last year paid 40% cash from its manufacturing profits. The company is now extending to meet the heavy demand on the coast and now offers a small block of its stock at par. For full particulars, write Box 80, CANADIAN MACHINERY, Toronto.

POSITION WANTED.

EXPERIENCED DESIGNER would like position in Canada as designer of pumps, air compressors, and small gas engines. Experience machinist, jig designer, and machine designer. At present head draftsman for turbine builders in United States. Can reduce shop cost to lowest possible figure. Address Box 66, CANADIAN MACHINERY, Toronto. (10)

WANTED—Position as superintendent of foundry, wood and metal pattern departments, by practical up-to date reliable man of large experience. Expert on molding machines. Best of references. Would consider general superintendent position with small concern. Farm implement line. Apply Box 67, CANADIAN MACHINERY, Toronto. [1]

FOR SALE.

FOR SALE—Half interest in a foundry and machine shop, situated in a beautiful town in Ontario. Is a going concern, employing from ten to fifteen hands the year round, with no opposition. For particulars apply to Box 81, CANADIAN MACHINERY, Toronto. (1)

PERIODICAL DEPT.

WANTED in every town of 2000 or over, a representative to take charge of the circulation of our various publications:—Hardware and Metal, Canadian Grocer, Financial Post, Plumber and Steamfitter, Dry Goods Review, Printer and Publisher, Bookseller and Stationer, Canadian Machinery, and Busy Man's Magazine. Good financial standing and business connection a strong recommendation. A permanent position for the right man. The MacLean Publishing Company, Limited, Toronto.

THE BUSY MAN'S MAGAZINE is the most popular periodical of its kind. Why? Because each issue contains a strong list of original articles of interest to every Canadian. It also reproduces the most timely, instructive and interesting articles appearing in the other magazines and periodicals of the month. The cream of the world's periodical press is too valuable to overlook. BUSY MAN'S is on sale at all news-stands. Better still, send $2 for one year's subscription. Mail it to day. The Busy Man's Magazine, Toronto.

THE MARKET REPORTS make Hardware and Metal a necessity to every hardware merchant, paint and oil dealer, foundry, or other metal manufacturing plant, in Canada. It is mailed every Friday. Subscription price $2.00 per year. Address Hardware and Metal, Montreal Toronto or Winnipeg,

MISCELLANEOUS.

NATIONAL AID—An aid to every business man in the world. Saves money, time, work and worry. The National Cash Register Co., F. E. Mutton, Canadian Manager, Cor. Yonge St. and Wilton Ave., Toronto, Ont.

HIGH CLASS COLOR WORK.—Commercial stationery, posters. The Hough Lithographing Co., Limited. Office, No. 3 Jarvis Street, Toronto. Telephone, Main 1576. Art, good workmanship, business methods. [tf]

ADDING TYPEWRITERS write, add or subtract in one operation. Elliott Fisher, Limited, 129 Bay Street, Toronto.

THE RELIABLE LIGHT will light your store 100% better than gas, electricity or acetylene. 600 candle power light costs 1 cent per hour to operate. Thousands in use. A safe, reliable, pure white light of intense brilliancy. Write for booklet M. The Rice, Knight Mfg. Co., Limited, 40 Lombard Street, Toronto. (1)

BETTER, CHEAPER, SAFER LIGHTING.—The Pitner System of Gasoline Lighting is the best system yet produced for lighting a store, hotel or public building. In cities and towns Pitner Systems are used because of the superior quality and quantity of light obtained for small cost. They are just as successful in any village or country place. A small outlay secures a complete and independent Pitner lighting plant. Free illustrated booklet and full particulars on request. The Pitner Lighting Co., Limited, Toronto, Canada. (1)

ENGINE BLUE PRINTS FOR SALE.

BLUEPRINTS for 1 h.p. 4-cycle and 3 h.p. 2-cycle motors, $1.50 each per set. A. J. Fisher, 239 Major Street, Toronto. [2-09]

General Electric Co.'s New Offices.

The Canada General Electric Co. and Canada Foundry Co. have moved into their handsome new offices situated on the northwest corner of King and Simcoe Streets, Toronto. This fine structure was designed by Architects Darling & Pearson, Toronto. It is well equipped for the economic handling of the business of these two companies. The steam heating plant in the basement was installed by the Canada Foundry Co. and the chimney by Alphons Custodis, New York, represented in Canada by Eadie-Douglas Co., Montreal. The electric wiring was done by the Canadian General Electric, and the elevators were built by Otis Fensom Co.

Big Hardware Transfer.

The old established wholesale and retail hardware business of Rice Lewis & Son, Toronto, has been purchased by R. C. Fisher and A. E. Gilverson. Mr. Fisher has until recently been general manager of the business, and Mr. Gilverson, secretary, of the company. Until the transfer is completed W. C. Crowther will remain as president, two representatives of the A. B. Lee estate and two of the John Ley estate remaining on the board along with Messrs. Fisher and Gilverson.

The five-storey building on the corner of King and Victoria Streets, will be sold, and the business concentrated in the large building on Victoria Street, ground floor of which will be made a retail hardware and sporting goods store with about 150 feet of plate glass window display. Above this will be four floors for offices and wholesale warehouse, with a stock of metals and a storehouse for other goods on Atlantic Avenue, with railway siding connections.

The plans for the removal from the corner building were made a couple of years ago, the firm having eighteen years ago co-operated in widening the lane beside their building to an extension of Victoria Street. The recent fire has brought the plans to a head and early next year will see the new heads of the firm installed in a modernly equipped building remodelled to suit the requirement of their wholesale and retail and machine tool departments.

Machinery Markets

THE WEST.

At the present time there are many matters of public interest claiming attention, and not the least of these is the final agreement between the Canadian Pacific Railway and the Town of Fort William.

The company's old exemption from taxation agreement expires this year, and negotiations have been in progress for some time for a new agreement, the details of which have finally been made public. The company are to have a further exemption on their property, from everything but school taxes, for a further period of fifteen years, and in return are to build a joint railway, passenger, vehicular and trolley bridge across the Kanninstikwia to Island No. 1, a bridge across the McKellar connecting the two islands, build a fine union depot with G.T.P., give the city 300 feet river frontage at the foot of McVicar, and another 300 at the foot of Sprague Street, for city docks.

Lastly, the company will erect an additional rapid coal handling plant. Though not definitely stated, it is understood this will have a capacity of 1,000,000 tons, and will erect a large cleaning elevator. This programme outlines an immense forward movement at the head of the lakes for the next three years at least. The amount of structural steel required will represent a small fortune in itself, to say nothing of the other building materials and the number of men that must necessarily be employed. The agreement is considered very advantageous to both parties. Improvements at Fort William that tend to the rapid handling of wheat outward and coal inward, are of such vital importance to the west that the terms of the agreement have been studied almost as anxiously by Winnipeg business men as they have by those of the town by the lakes.

A matter that is of immense interest to the building trade of the west, and more especially to that of Winnipeg, was the merger effected recently of a number of the smaller stone quarries into the Garson Quarry Company, Limited. The new organization will have a capital of $250,000 and it is expected that the output will be increased by about 300 per cent. The principal quarries are located at Tyndall, which is only 26 miles east of Winnipeg. At present the equipment of this quarry consists of three gangs of saws and one planer, and it is now proposed to increase this equipment by two double diamond saws, one single diamond, four planers, two lathes and pneumatic tools. Thus equipped this quarry will be the largest in Canada and one of the largest on the continent of America.

MONTREAL.

Although in some quarters the lull incidental to the end of the year holidays and first of the year inventory taking has been noticed in the slightly decreased number of inquiries, the machinery market for this district is brisk. There have been no orders of unusual size taken but the number of small or medium size orders placed in December have been better than those for the preceding two months. One house stated that the business done in December up to the 22nd was larger than that for the whole of any other month in the year, with inquiries numerous. Prices show a tendency to advance, owing to the manufacturers growing busier. The machine tool outlook is bright, but the dealers do not look for much increase until after the year-end inventories have been taken. Not a few of the inquiries received are from those who, in taking stock, desire a price on a certain machine, merely for the purpose of comparison in appraising their own.

Wood-working machinery, in some cases, is moving faster at the present time than the iron working machines, notwithstanding the fact that this time of the year is usually a slack one for machines of this class. The majority of dealers report machinists' tools to be moving well, while the outlook for machinery supplies is optimistic. One maker of oil furnaces and other oil-burning apparatus reports their factory working night and day shifts to keep pace with orders following closely on the heels of inquiries.

The foundry supply trade is a little slow at present, although inquiries are increasing, which seem to indicate a good increase in future business. In this line there are two or three large undertakings hanging fire in this district, but will probably be settled after the beginning of the new year. There are movements under way for the establishment of two large branches of foreign manufacturing plants in this city, which will undoubtedly increase wood and iron-making machinery orders from here.

The demand for grey iron castings is increasing favorably the bulk of the sales being small, light pieces.

The tool steel trade is quiet, but it is easy to see that the new year will bring renewed activity along this line. The recent depression which prevented large stocks being carried is a thing of the past and those stocks having to be replenished will show large increase in sales of tool steel.

TORONTO.

There is a buoyant feeling among the machinery dealers on account of increased inquiries for machine tools. The business during the past two months has exceeded any other two months during the year. This is very encouraging, especially in view of the fact that business is usually dull during this season. Many establishments take their stock inventories at this time of the year. On this account the demand for tool steel has been quiet, the manufacturers desiring to keep the stock low for that reason, and there is little tendency to place orders for machinery.

Several new machine shops have been opened up in Toronto and through western Ontario and were supplied through Toronto houses. Several new factories are planned for Toronto and western Ontario, which makes the business outlook good for next spring. Business has been growing steadily and the character of the inquiries indicates a good opening for the first months of 1909.

BOOK REVIEWS.

MACHINE SHOP CALCULATIONS. By Fred H. Colvin. 174 pages, illustrated, published by Hill Publishing Co., 505 Pearl Street, New York. Price, $1.

The book gives a clear and simple explanation of the calculations necessary to solve practical machine shop problems. The chapters deal with fractions, pulley speeds, thread calculations, machine speeds, measurement of angles, vernier, micrometer, etc.

MECHANICAL WORLD DIARY Dairy for 1909 from Emmott & Co., 65 King Street, Manchester, Eng. Price, 6d. 395 pages, being the 22nd annual issue.

The book contains valuable information on boilers, steam engines, engine room accessories, superheated steam, castings, turbines, gas engines, valve data, rope and belt drive, gearing, etc. Friction clutches are dealt with in a comprehensive manner and a section on chain drive has been added.

CATALOGUES.

UNIVERSAL RADIAL DRILL—Circular from the Fosdick Machine Tool Co., Cincinnati, illustrating and giving full specifications of their 4, 5 and 6-ft. half and full Universal radial drill.

FRICTION CLUTCH—Catalogue G. from the Hill Clutch Co., Cleveland, O., describing and illustrating friction clutch pulleys and couplings together with the necessary accessories and extra parts and costs of same. Some useful tables, such as standard key seats, are also included.

ROLLER BEARINGS — Folder from Hyatt Roller Bearing Co., Newark, N.J., telling how to reduce friction.

AUTOMATIC SCREW MACHINE—Folder from National Acme Mfg. Co., Cleveland, Ohio, describing the No. 515 machine with chuck of 9-16 inch capacity.

AUTOMATIC SCREW-DRIVER — Folder from Reynolds Machine Co., Rock Island, Ill., describing Reynolds automatic screw-driver for wood or machine screws.

AIR TOOLS—Circular L., from Independent Pneumatic Tool Co., Chicago, describing Thor pneumatic tools, including piston air drills, hammers, one-piece riveting hammers, etc.

REAMERS—Catalogue of Peerless high-speed reamers from Cleveland Twist Drill Co., Cleveland. Standard sizes and prices of hand, straight shank chucking, expansion chucking, taper shank, core, shell reamers, etc., sockets and wrenches. These tools are also made to order.

DIE CAST PARTS—Catalogue from H. H. Franklin Mfg. Co., Syracuse, N.Y., illustrating the use of die cast parts for telephones, electrical apparatus, automobiles, time recorders, adding, calculating machines, etc., and for all devices requiring intricate parts.

COLD METAL SAW—Catalogue from Lea Equipment Co., 136 Liberty Street, New York City, describing belt and motor-driven metal saws and automatic grinders.

TOPSPEED PLANERS—Catalogue from Bateman Machine Tool Co., Hunslet Planer Works, Leeds, England. This catalogue is well printed on heavy paper and illustrated. It contains descriptions of their regular planers, and of their rail planer, drives, formulae and running costs.

BELTING—Price list of belting from Sadler & Haworth, Montreal and Toronto, manufacturers of oak-tanned belting.

A. C. GENERATORS—Bulletin No. 1038 from Allis Chalmers Bullock, Montreal, describing various types, details of construction, tables of sizes with speeds, etc., are given and numerous illustrations of instalations.

HIGH POWER MILLERS—Handsome catalogue from Cincinnati Milling Machine Co., Cincinnati, on heavy coated paper, describing and illustrating their new horizontal and vertical millers made in four styles of drive. These machines embody a number of entirely new features and are built on the unit system so that one style of drive may be changed to the other if advisable.

ELECTRIC LOCOMOTIVES—Special publication 7061 from Canadian Westinghouse, Hamilton, describing and illustrating in detail Baldwin-Westinghouse electric locomotives for mine and industrial service.

MANGANESE STEEL CASTINGS Pamphlet from American Brake Shoe & Foundry Co., 405 Western Union building Chicago, Ill., listing the steel castings which they are prepared to supply.

POWER TRANSMISSION Catalogue No. 24 from the A. R. Williams Machinery Co., Ltd., Toronto, 121 pages, illustrated, listing in full their lines of power equipment, including hangers, bearings, pulleys, clutches, belting, gears, hoisting ropes, etc.

MELTING FURNACES Rockwell Furnace Co., New York, catalogue on heavy paper, well illustrated, describing melting furnaces for melting all metals, tinning, galvanizing, tool hardening, etc., oil burners, oil fuel pumping systems and pressure blowers.

FOUNDRY EQUIPMENT — Whiting Foundry Equipment Company, Harvey, Ill., catalogues 43-55, containing 243 pages, well illustrated, showing electric and hand power cranes, pneumatic hoists, cupolas, crane ladles and other foundry equipment. The Whiting cupola is described in detail with sectional views and a diagram showing general dimensions.

Single and Duplex Pumps, Condensers, Travelling Cranes, etc.

GARDNER & WILSON, NIAGARA FALLS.

Messrs. Gardner & Wilson, civil engineers, have recently opened an office at Niagara Falls, to carry on a general practice. They will give special prominence to electric railway and hydro-electric work.

Mr. J. C. Gardner, B.A.Sc., has been twelve years in engineering work, having been connected with the construction of the three bridges across the Niagara River below the Falls, and of the power houses of the Niagara Falls Power Company and the Ontario Power Company. He was two years with the Toronto & Hamilton Railway Company, going to Chile early in 1906 to work on the construction of the Arica & La Paz Railway through the Cordilleros.

Mr. Norman D. Wilson, B.A.Sc., after two years in bridge and city work, and a year in the office of the late W. T. Jennings in connection with the Toronto & Niagara Power Company. He has been on location and construction in Ontario and the West for four years, for the G.T.P. and C.P.R..

PERSONAL.

Leslie Craufurd has been appointed City Engineer of Nelson, B.C.

H. E. Carry, C.E., who has for some time been engaged in business in Merritt, B.C., has removed his office to Vancouver.

Mr. Albion, formerly foreman of locomotives of the Ontario division of the Canadian Pacific Railway, has been appointed district master mechanic on the same road, with offices at West Toronto, Ont.

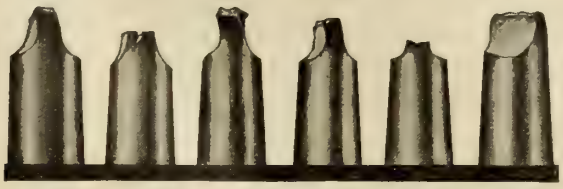
What are Your Twisted off Tangs costing you?

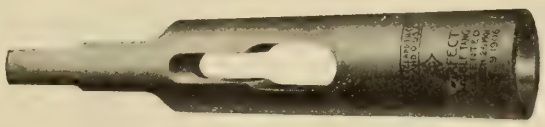
The broken tang was only .312 inches in thickness



The new tang is .500 inches in thickness.

Have you ever considered what it is costing your shop to throw away taper shank tools with tangs twisted or broken off? It is a great waste of good material that *should be saved* and *can* be.

Patented Mar. 26, '01



Patented Oct. 9, '06

"PERFECT Double Tang" SOCKETS

not only prevent the tangs on your new drills twisting off, but also make your tools with broken tangs stronger and better than they were when new.

¶ *Simply grind a second and stronger tang on the shank below the original one. It is 25% to 60% thicker than the original tang according to the size of the shank. The Double-Tang Sockets do the rest.*

Fit any Drill Press or Lathe Spindle
Made in all Styles and Sizes
Ordinary Drift removes Drills

Good for the Scrap-heap.

Send for "S.C." Circular and Discounts

Ready for the Drill Press

C. J. FENSOM, M.E., Consulting Engineer
43 Victoria St., - Toronto
SPECIAL MACHINERY
designed, inspected, contracted for
TESTS, REPORTS, VALUATIONS
Manufacturing Plants laid out or re-arranged

T. PRINGLE & SON
HYDRAULIC MILL AND ELECTRICAL ENGINEER
Factory and Mill Construction a Specialty.
Coristine Bldg., St. Nicholas St., MONTREAL

PATENTS *TRADE MARKS AND DESIGNS*
PROCURED IN ALL COUNTRIES
Special Attention given to Patent Litigation
Pamphlet sent free on application.
RIDOUT & MAYBEE *103 BAY STREET TORONTO*

JULES DE CLERCY, M.E.
GAS ENGINEER
Expert knowledge of all classes of Engines and Producer Plants. If you are thinking of installing a Gas Engine or Producer Plant write me. If your plant is not working satisfactorily I can help you.
62 Ontario St. West, - MONTREAL, QUE.

JAMES TAYLOR
(Cert: Chief Engineer)
Consulting and Superintending Marine Engineer.
Specifications, Designs, and Plans prepared of Machinery for Steam Yachts, Launches, Barges, Trawlers Tugs, Cargo and Passenger Steamers. Vessels surveyed for Damage or otherwise and reported on. Steamers, contracted for and superintendence conducted in Canada or abroad. Correspondence invited. Appointments by arrangement.
GRANT ST., NEW GLASGOW, NOVA SCOTIA

PATENTS PROMPTLY SECURED
We solicit the business of Manufacturers, Engineers and others who realize the advisability of having their Patent business transacted by Experts. Preliminary advice free. Charges moderate. **Our Inventor's Adviser** sent upon request. Marion & Marion, New York Life Bldg, Montreal; and Washington, D.C., U.S.A.

RODERICK J. PARKE
A.M. Can. Soc. C.E. A.M. Amer. Inst. E.E.
Consulting Electrical Engineer
INDUSTRIAL STEAM AND ELECTRIC POWER PLANTS DESIGNED, TESTS REPORTS
205 Yonge St., Bank of Toronto Bldg.,
TORONTO
Long Distance Telephone—Office and Residence

BAIN & MITCHELL
CONSULTING and CONTRACTING ENGINEERS
SPECIALTIES—Marine, Stationary, Hydraulic, Engines, Boilers, Steam Power Plants, Reports, Tests, Inspections, Plans, Specifications, Valuations and General Drawing Office Work.

Our Catalogue A Necessity

Why? Because it is the most complete Foundry Supply and Fire Brick catalogue ever printed. You need it as a reference. A postal card will bring it to you. Most of the goods illustrated therein are in stock at our Windsor plant.

'Tis an advantage to you to buy where you can get prompt shipments without having to bother with custom entries.

We appreciate past courtesies and wish you a Happy and Prosperous New Year.

WELDING WITH THERMIT

The last issue of REACTIONS, our quarterly publication, describes a large number of repairs which will prove of great interest to those connected with manufacturing plants, foundries, steel works, railroads, etc.

By the THERMIT PROCESS welds may be made without removing the broken part. Crank shafts, gear wheels, connecting rods, electric motor cases, and all other broken steel sections may usually be welded and returned to service in two days or less.

Write for REACTIONS and Pamphlet No. 18-D

Christmastide and Resolutions for "New Year"

Breathing of "peace on earth" good will to all men

"COMMERCIAL CANADA," breathing now the air of vigor, grown up from infancy and now at the age of adult prime and intensity of purpose to advance in the manufactures of Foundry, Machinery, Railroad, Mining and sundry vocations of material and increased progress. The dawn of a new era is at hand! Vast possibilities for the future, population is hardly perceivable for covering the territory. Therefore, consider! Necessity for "MONARCH MODERN METHODS." We ask of a portion of "Canadian Clannish Consideration," being of the same English-speaking race: Hear ye! To wit, result of our short acquaintance, some of our customers, Pacific, "British Columbia Eng. Works," Welland, Beatty & Sons; Copper Cliff, "Canadian Copper Co."; Cobalt, "Coniagas and others"; Kingston, "Canadian Locomotive Works"; Montreal, "Jenkins Bros. Valve Co." We submit a few only, combining "Foundry, Locomotive, Valve, Mining, Etc." Their reputation is of the highest. Then, WHY HESITATE? Friends, place "Coke and Coal" Furnaces to the rear. Forward! Let the blunders of the past drop, and appreciate and

For The New Position

Knowledge!
Experience!
Skill!

YOUR Success in Life Depends Upon These Three Things.

THE CYCLOPEDIA OF

MECHANICAL ENGINEERING

puts these three necessary qualities within the reach of every man to-day.

The old-fashioned cry of "I have never had a chance," is not taken as a satisfactory excuse now. Education and advancement are within easy reach of every man. Each has an equal chance—it just depends upon his ambition, whether he is willing to devote a few hours each week to useful study and reading.

This Cyclopedia is the compilation of the most recent practice of the best mechanical engineers in America. The seven volumes contain 2,992 pages and hundreds of illustrations, plates, diagrams, etc. It is the history of mechanical endeavor—the foundation of mechanical progress Based upon the courses offered by the Mechanical Department of the American School of Correspondence, it presents and solves problems which are continually confronting the working engineer.

To acquaint the public with the practical character of the Home Study Courses of the American School of Correspondence, from which the Cyclopedia was compiled, we make this special

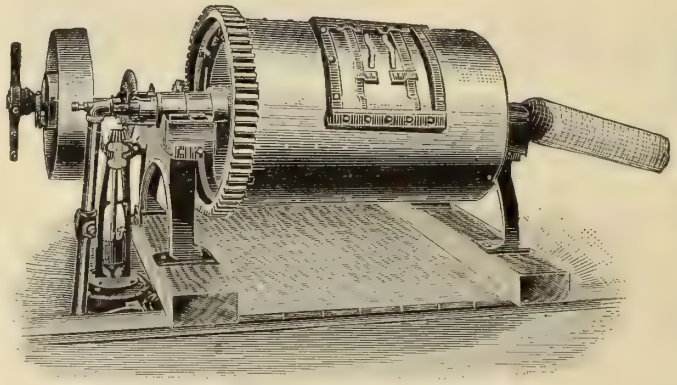
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

May be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to re-claim this iron and be astonished at your former loss and pocket the rich returns from your newly discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three to four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote.

Write for Cinder Mill Catalog F.

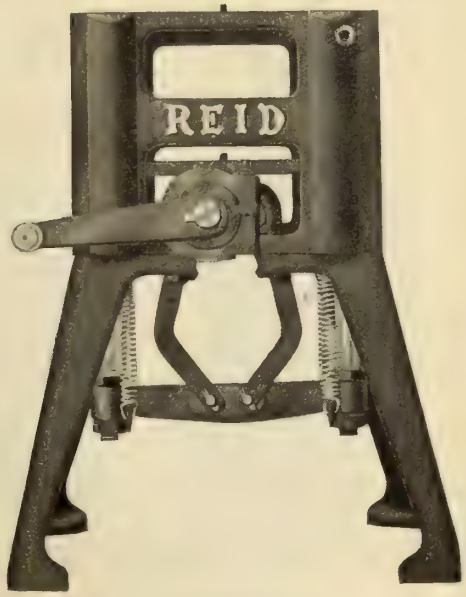
IN THE SAVING OF TIME AND MONEY

THE

"REID" Hand-Rammed, Stripping Plate MOLDING MACHINE

EXCELS ALL OTHERS.



12-in. Machine
Front view, showing pattern frame down

¶ This fact has been demonstrated to the absolute satisfaction of a large number of the more prominent foundrymen of the United States and Canada. The superintendent of one of the largest foundries in the United States, who has used all styles of machines, says that the "REID" is the cheapest, most rigid, and most perfect draw-down machine he ever saw. ¶ Send for our booklet. It gives in actual detailed figures the saving accomplished by the Reid Molding Machine in one foundry.

FOR THE BRASS FOUNDRY:—

We can save you from 25% to 30% on Iron Flasks—MADE IN CANADA. Any style or size in Bevelled, Plain or Ribbed. Machined joints, absolutely interchangeable with each other. If you have a machine of any make, we will gladly give you quotations on Mounting Patterns so that you can obtain the best results. We are experts on this line.

HANDING IT OUT!

Of course, we know the verdicts of Judges and Juries have been criticised from time immemorial and will be criticised until time is no more; but here is a Judge who is handing it out about right. He is advising this Knight of the Ladle to use

STEVENS' PURE PLUMBAGO

and avoid trouble.

The reason is obvious. It is direct from India—the home of the only good plumbago and the only good elephants, hence my trade-mark is synonymous of good plumbago.

You can buy a barrel as you would a pair of gloves—try it before buying. If it does not fit your case you needn't pay for it. The risk is always on me.

The same condition applies when you buy anything of me. It is in this way that I have introduced my **Wet Blackings, Ingot Mold Blackings, Core Compounds** and in fact, all the facings I manufacture, and I manufacture them all. I also manufacture **Buffing Compositions, Polishers' and Platers' Supplies.**

It is the spirit of concentration and the minimizing of cost—concentrate your orders with me and you will minimize the manufacturer's profit. I will divide it with you.

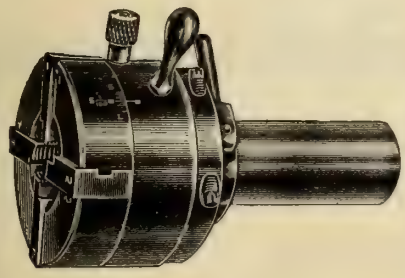
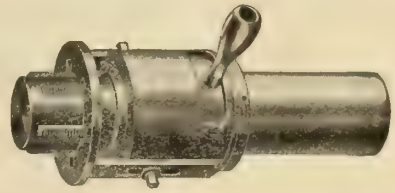
GEOMETRIC TOOLS

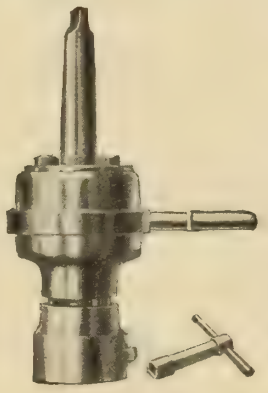


SELF-OPENING SCREW CUTTING DIE HEADS

Made in sizes suitable for cutting any diameter, pitch or form of thread required, and for use on Screw Machines or Turret Lathes.

As the dies are released from the work instantly at the end of the cut, there is no danger of stripping or marring the thread, as the Die Head can be run back without touching the work.





REVERSING TAP HOLDERS

This tool can be applied like any ordinary Drill Chuck and works equally well in either an upright or horizontal position.

These holders are so sensitive that it is impossible to break the taps used in them.

ADJUSTABLE COLLAPSING TAPS

These tools save all the time formerly wasted in "backing out."

The Chasers automatically recede when the desired depth is tapped, which allows the tap to be withdrawn at once.

PATTERN MAKING

By JAMES RITCHEY

Instructor in Wood Working, Armor Institute of Technology.

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00.

Given free with two yearly paid-up subscriptions.

Handbook of Practical Mechanics

By CHAS. H. SAUNDERS

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00 Postpaid.

Given free with two yearly paid-up subscriptions.

MACHINE SHOP WORK

By FREDERICK W. TURNER

Instructor in Machine Shop Work, Mechanic Arts High School, Boston.

208 pp., 200 illus. Cloth binding. Abounding in interesting illustrations and valuable instruction in the practical use of all sorts of tools and machines used in the up-to-date machine shop, and will be found to meet every requirement of the shopman, from the simplest tools to the most complex turning and milling machines. Contents include Tools Operated by Hand, Power Driven Tools, the Lathe, Drill Press and Planing Machines, Milling and Grinding Machines.

Price, $1.50.

Given free with three yearly paid-up subscriptions.

TOOL MAKING

By EDWARD R. MARKHAM

Instructor in Machine Shop Work, Harvard University and Rindge Manual Training School, Formerly Superintendent Waltham Watch Tool Co.

225 pp., 325 illus. Cloth binding. The whole subject is here exhaustively treated and profusely illustrated. The information given is of inestimable value to all machine shop men, metal and wood workers, and all whose tasks may occasionally call for the exercise of mechanical skill, ingenuity and inventiveness in the devising of special means to accomplish special ends.

Price, $1.50.

Given free with three yearly paid-up subscriptions.

FOUNDRY WORK

By WM. C. STIMPSON

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00.

Given free with two yearly paid-up subscriptions.

MECHANICAL DRAWING

By ERVIN KENISON, S. B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology.

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00.

Given free with two yearly paid-up subscriptions.

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

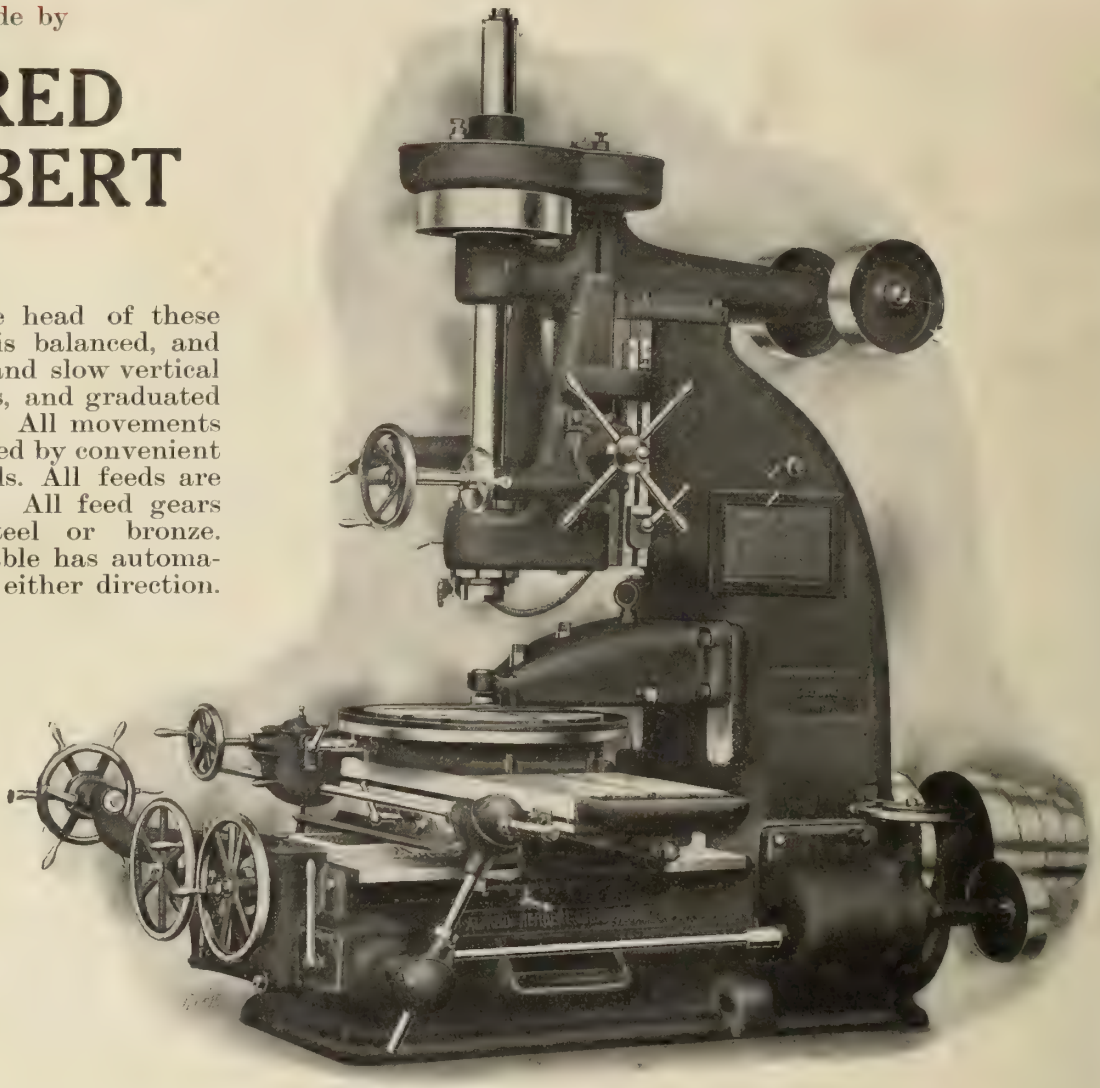
NO. 8 MILLING AND PROFILING MACHINE

With Patent Dial Feed Motion 62 x 38 x 26 in.

Made by

ALFRED HERBERT LTD.

The spindle head of these machines is balanced, and has quick and slow vertical movements, and graduated index disc. All movements are governed by convenient hand wheels. All feeds are reversible. All feed gears are of steel or bronze. Circular table has automatic feed in either direction.



We also supply Horizontal Milling Machines in several sizes manufactured by the same firm. In addition we carry a complete range of Machine Tools of every description, including Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Shapers, Slotters Bolt and Nut Machinery, Cutting Off Machines, Drilling Machines, High Speed Coal Saws, Turret Lathes, Engine Lathes, Brass Finishers' Lathes and Special Machinery of every kind.

We also carry Velos High Speed Steel and Twist Drills and Special Steel for all purposes, Pneumatic Tools, Chain Hoists, Woodworking Machinery, etc.

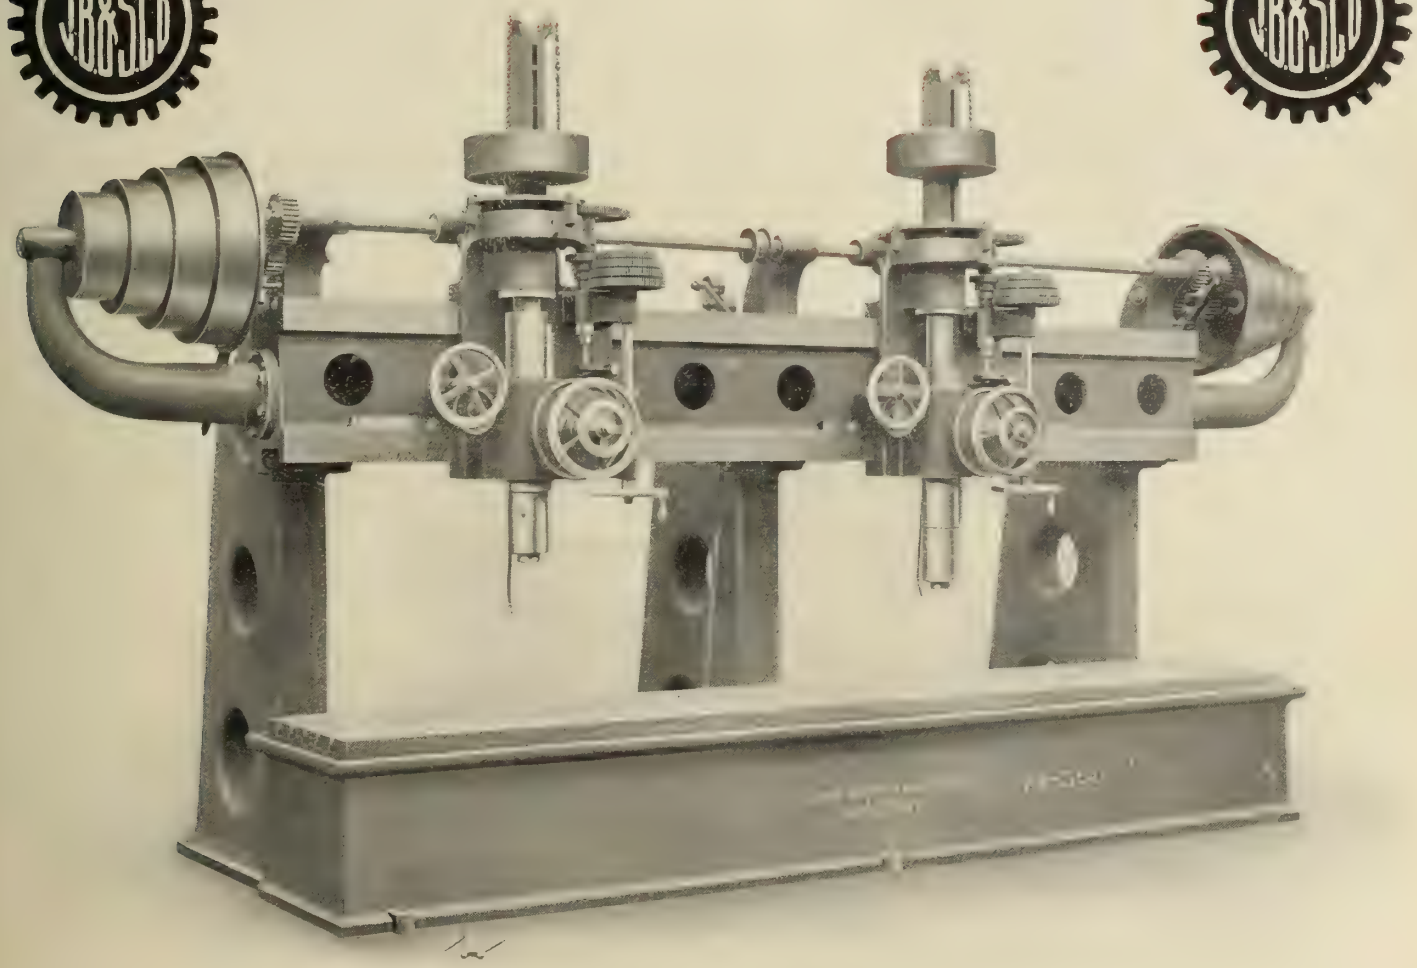
LABOR SAVING MACHINE TOOLS



LOCOMOTIVE ROD DRILLING MACHINE

The illustration presents our Locomotive Rod Drilling Machine with belt drive. This machine is designed for boring the ends of the heaviest locomotive connecting rods. The spindles have an adjustment of 32 to 132 inches between centres, and power and speed range for holes 2 inches up to 10 inches in diameter.

Our illustrated catalogue describing the full line of railway and car shop tools we manufacture mailed to any address.

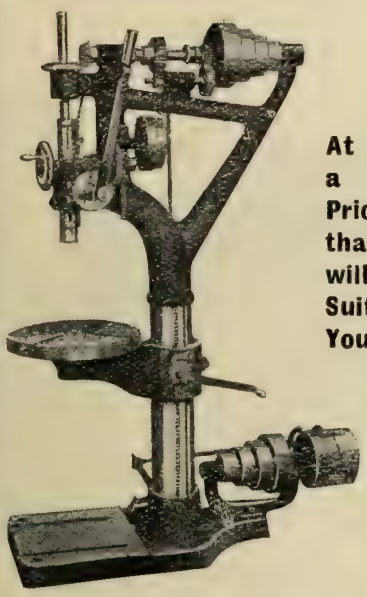
A Good Drill



At a Price that will Suit You

Most powerful drill of its size on the market. Screw has quick return and automatic stop. Table is raised by a crank which retains its relative position to the table at all times. Shafts are steel, gears cut two to one; cone has four changes for belt. Drive pulleys are 8 in. in diameter with 3 in. face and will make 300 revolutions per minute. Many other good points and measurements explained in circular.

BAWDEN MACHINE TOOL CO.,
22 Orillia Street (back of Iroquois Hotel)
TORONTO - - - - - CANADA

HANDICAPPED

If you are handicapped by the trouble and expense of operating a small shop we can relieve you by building your machines on contract. By doing this you will eliminate all the overhead expenses that necessarily accompany a small plant. It will enable you to develop a large market for your machines by giving your entire attention to the selling end. Figure out your present manufacturing expense—then send us your blue prints and specifications and get our estimate.

We guarantee perfect workmanship.

Westinghouse Individual Motor-Drive For Machine Tools

Overtime work is always expensive

Doubly so in a mechanically driven plant, where shafting and belting must be kept going. With Individual Westinghouse Motor-Drive the cost of power is only that for the machines being actually used.

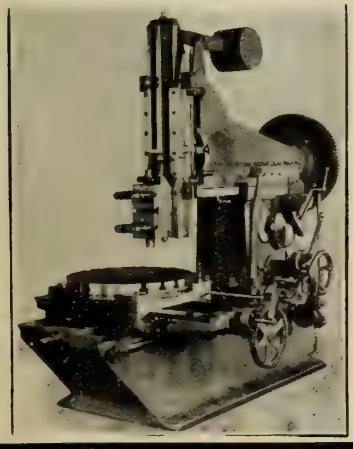
Forming Turret Lath:—16-inch swing

For Brass Work

TURRET LATHES in types and sizes for every requirement, furnished with plain, set-over or universal turret; with plain or geared-friction head; with cut off or with forming attachment — either vertical or undercut; with or without automatic chuck and with or without chasing attachment.

The catalog gives full information. It will be sent on request.



Feed the Tool to Heavy Work!

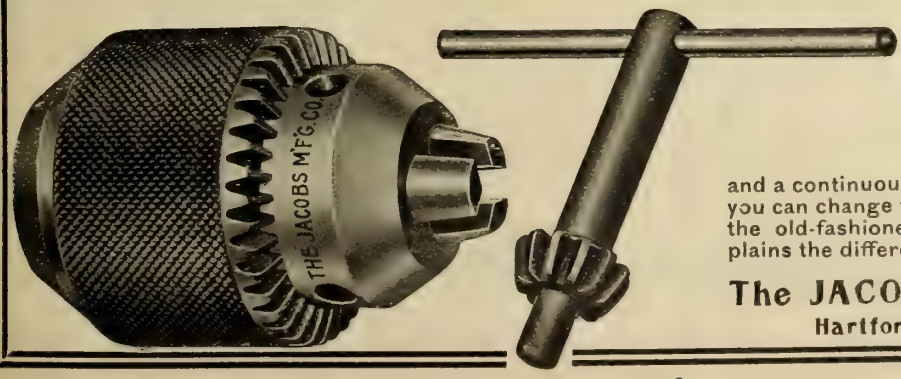
There is only one Slotter on which the tool may be fed to such work as is too cumbersome to be fed to the tool- the DILL SLOTTER. It is equipped with a traveling head for that very purpose. Consequently you can handle a class of work on the Dill Slotter that cannot be touched by other slotting machines. It has many other exclusive features such as six changes of speeds–four is the usual; Belt and Motor Drives- not a makeshift, but designed for both; geared at about double the usual ratio.

Send for the Dill Catalog!

THE DILL SLOTTER PEOPLE

PHILADELPHIA PENNA.

TIME SAVED in CHANGING TOOLS



will soon pay for an equipment of

JACOBS Improved DRILL CHUCKS

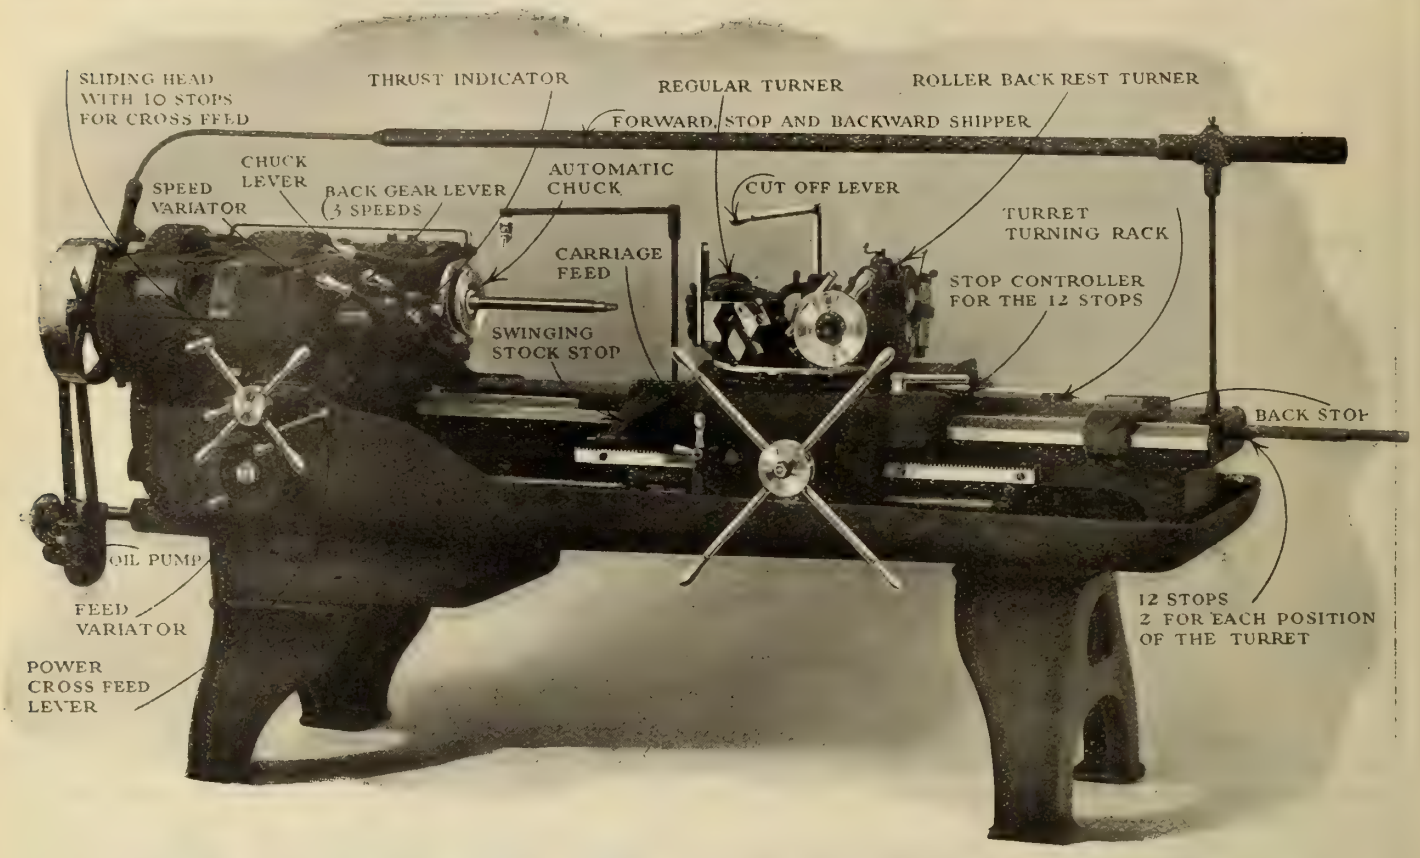
and a continuous profit on top of it. With a Jacobs Chuck you can change tools in a fraction of the time it takes with the old-fashioned spanner chuck. Our catalog fully explains the difference. SEND FOR A COPY TO-DAY.

The JACOBS MANUFACTURING CO.

Hartford, - Conn

THE

Hartness Flat Turret Lathe



Our entire plant is devoted to the building of Flat Turret Lathes exclusively. We have been following this policy of sticking to one thing for over twelve years.

SOME OF THE CHARACTERISTICS OF THE HARTNESS FLAT TURRET LATHE ARE

Originality in design—Unflinching control of work and tools
Accuracy of output

The Lathes are now equipped with outfit of tools for handling both bar and chucking work. This tool equipment is of the adaptable kind, taking care of all work within the range of machine—NO SPECIAL TOOLS REQUIRED. A change in your product does not call for a new tool equipment.

Our aim is to lead—not follow.

Our Catalogue gives full particulars, shall we send you a copy?

THE ECONOMICAL PRODUCTION OF

Interchangeable Parts

is not obtained by devising more and more complicated machinery, and manufacturing systems, but by adopting an entirely new process of manufacture — "The Franklin Process of Die Casting" — by which interchangeable pieces are cast to finished sizes, in steel dies, and are ready to assemble as soon as cold. Every one is equal to the best machine made ones, and made with a cheapness, rapidity and accuracy that no other process can equal.

Write for booklet "F" and samples; they will probably suggest at a glance where great savings can be made in your manufactured articles.

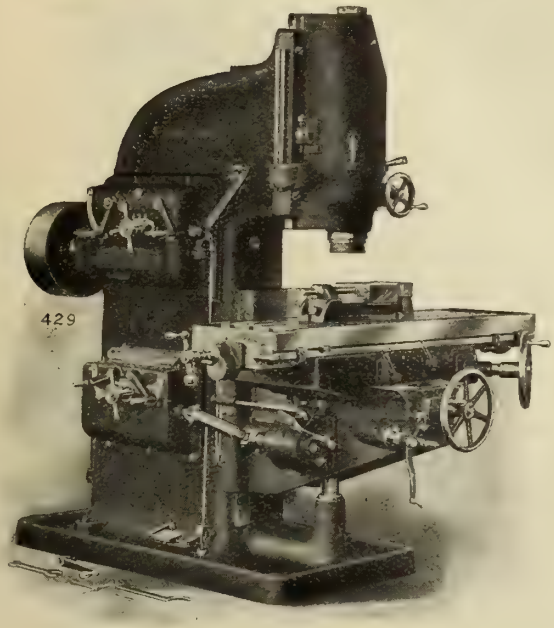
LAPOINTE MACHINE TOOL CO., HUDSON, MASS.

High Power Vertical Cincinnati Millers



are made in 3 sizes — 28", 34" and 42" table travel and of 5 h.p., 7½ h.p. and 10 h.p., respectively.

Four styles of drive, all interchangeable; Torsional vibration eliminated; locked tumbler; treadle for quick speed changing; direct reading feed and speed index; quick pitch feed screws; single plunger trip; feed levers control reverse and always indicate which way the table will move; sight feed oilers. **The spindle head** is made in large proportions—see illustration; head can be securely bolted to the column when doing heavy milling. **The drive** is always through the main gear close to the lower bearing. **The spindle bearings** are always the maximum distance apart.

Because of all these new features these machines have greater cutting capacity than other Verticals of equivalent size.

Ask us for our High Power Miller Catalog.

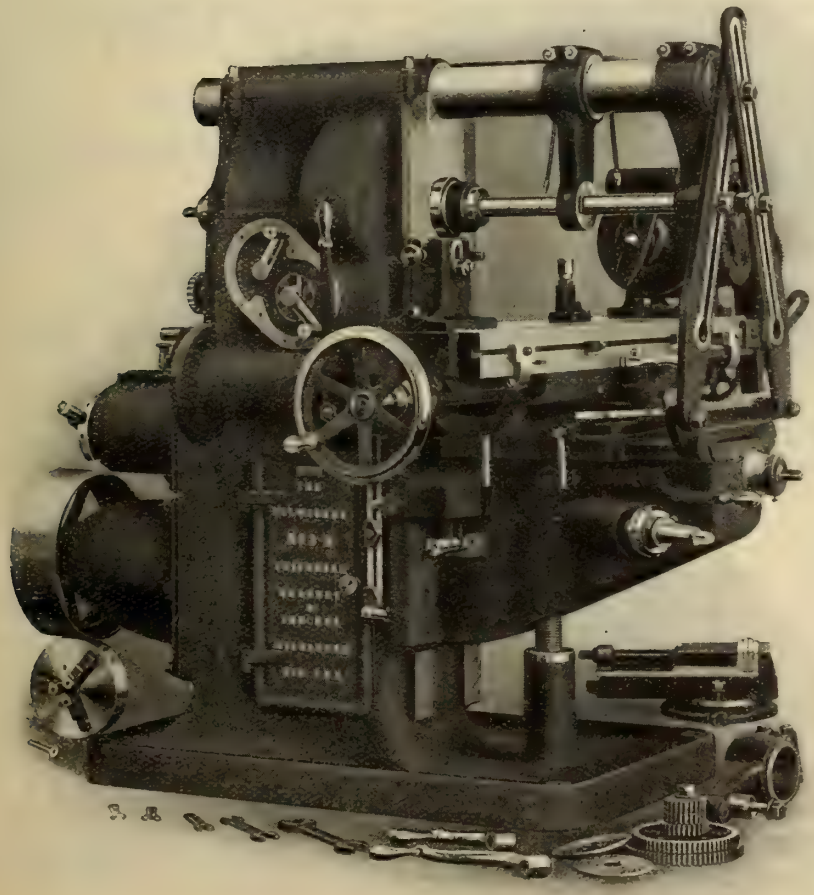
CINCINNATI, OHIO, U.S.A.



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

THE INADEQUACY of IMITATION

A PLASTER copy of a masterpiece in sculptured marble lacks the master's touch. Same way with a machine. An imitation of a Gould & Eberhardt Gear Cutting Machine or High Duty Shaper lacks the painstaking thoroughness in workmanship that accompanies original knowledge; and its quality is therefore inferior. We have been manufacturing these machines for over sixty years. During that time we have brought our product to a pitch of perfection unattainable by the mere imitator. We have the special equipment and trained men that enable us to produce our own designs in a way that confounds the cleverest imitators.

Before ordering any Gear Cutting Machinery or Shapers send for our Catalog and get posted on the quality of our machines.

GOULD & EBERHARDT
"HIGH DUTY" SHAPERS
AUTOMATIC GEAR AND RACK CUTTING MACHINERY
ESTABLISHED 1833 NEWARK, N.J. U.S.A.

SPEED LATHES

We build these lathes in 11, 13 and 16-in. swing with beds from 3 to 12 feet in length. Spindles are hollow crucible steel fitted with Morse standard taper and run in bronze boxes. Tailstock has our patented screw and lever feed; and taper wedges by means of which a correct alignment can always be maintained. Beds are cross-braced like engine lathe beds, and all clamping levers are at the side.

"**SHOW ME,**" said the Man from Missouri.

Like him, you want to see value before investing in a grinding machine. We are prepared to show you real value in every

BATH GRINDER

We will show you that its work is positively the most economical and accurate on all kinds of reamer and cutter work, face grinding, surface work, internal work and cylindrical work on centers. We will show you that the Bath Grinder does this work better than any other machine made. Every part of the Bath Grinder is a combination of modern design, high-grade material and splendid workmanship.

The Bath Grinder Co. INC.

Fitchburg, Mass., U.S.A.

Long Life of a Grinding Wheel

is a secondary consideration. Long life does not necessarily mean economy. "Big Production" should be the slogan, not hardness, not merely long life. Production must not be sacrificed.

A wheel that wears away fast *may* produce more work in a given time than a much harder wheel; it *may* be a much cheaper wheel to use than the harder wheel because of its larger production. Time saved is a big item.

Grinding wheel economy results only from having a wheel of the proper cutting qualities for the particular work to be done—a wheel of correct Grain and Grade and "Grit," of correct temper scientifically bonded.

Alundum has the correct temper.

Bonding abrasive material together in the form of grinding wheels calls for scientific study and practical experience.

The "Norton" ideal wheel for any kind of material is the result of long experience in manufacturing wheels for different purposes—long experience with both the grit and the bonding.

Alundum Wheels have long life. They also have a reputation for big production during a long life. There is a difference between long life resulting from "hardness" of grade, or bond, and long life secured without sacrificing production.

Have you the booklet "Helps—Don'ts" for all who grind?

Norton Grinding Wheels are made of Alundum

Fitting the Wheel to the Work

Are you getting the highest efficiency out of your grinding department?

Are you sure that the wheels you are using are exactly suited to the work you have to do?

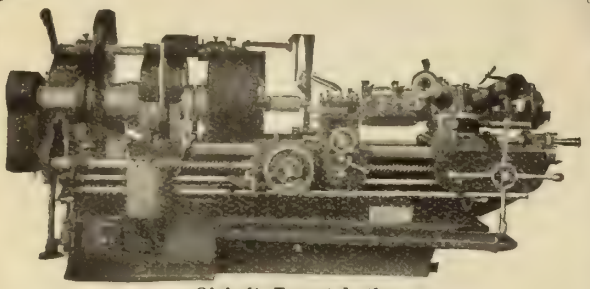
Right size—Right grit—
Right degree of hardness?

Carborundum Grinding Wheels will do your work faster—better—more economically than any other grinding wheel on earth—but to get the BEST results you must have the RIGHT wheel.

Let us help you find it.

THE CARBORUNDUM COMPANY, NIAGARA FALLS, N.Y.

GISHOLT



Gisholt Turret Lathe.

GISHOLT LATHES

are built in six sizes, from 13 in. to 41½ in. and are adaptable to either bar or chucked work. Many shops use Gisholt Lathes part of the time on such work as cross-head pins, crank hanger pins, etc., and part of the time for chucking, keeping the machine constantly busy.

Gisholt Boring Mills are built in fifteen sizes, from 30 in. to 120 in., and are equipped with the most improved devices for time and labor saving.

The Logic of Illustrating

The persuasive quality of advertising is practically doubled by an A 1 illustration—it impresses the possible customer with a definite idea of your product no word-picture could impart. *Vice-versa,* a poor illustration condemns your work at the outset. It's a positive sale-killer. Isn't it folly, therefore, to allow valuable space to carry a cut which is a libel on your goods?

¶ The most extensive illustrating business in Canada has been built on the sound basis of high quality and a fair price, and—*it belongs to us.*

A Machine for Doing "Duplicate Work" in Marketing, Full Automatic, Great Capacity

THE technical or trade paper is a special machine for doing "duplicate work" in marketing—for multiplying almost endlessly and simultaneously in the minds of your possible customers, impressions of your product which will lead, sooner or later, to inquiries and sales.

¶ This work can be done by hand—through the personal efforts of salesmen, but, however thorough, it is tedious and costly and lacks the continuity of the machine method—the technical or trade paper—which is not only certain to find and work upon the right *class* of material, but the very highest quality of that class.

¶ These special machines for marketing are especially designed to remove prejudice, secure attention, awaken interest and create desire—steps of which at least three must precede each sale—work which no manufacturer who seeks a wide market can afford to do by hand, even though he were so fortunate as to have all of the best material to work upon—material which the machines are constantly creating for and attracting to themselves.

¶ The salesman should not be allowed to do *all* the work of marketing—he should do only the fine fitting and finishing that really call for "hand work," and not the preliminary operations which can be done so much more thoroughly and economically by the powerful and efficient machines found in the Trade Press.—*Selling Magazine.*

VANCOUVER, B. C.,—Frank Darling, Agent

"Renold Chains"

HANS RENOLD, LIMITED, of Manchester, England, for thirty years now have been specialists in the manufacture of Chains for driving purposes. Their large works, with over seven hundred employees, manufacture only Chain Drives, and they have the best of opportunities to study this subject from the numbers of drives they have installed and in their own works which are largely chain driven. This business is one that requires great attention to detail, the material of which the chain is made, methods of tempering, best form of tooth, accuracy of workmanship, etc. These are not points that show conspicuously, but they cause the success or failure of the drive. That Renold's have made a success of this drive is demonstrated by their position in the engineering world, and their present works. A long description of the latter, reprinted from "*Engineering*," London, we will be pleased to forward on request.

The High Speed Milling Cutter With Inserted Blades*

Steps in the Development of a High Speed Steel Helical Blade Milling Cutter, with Inserted Blades for High Powered Milling Machines.

By WILFRED LEWIS and WM. H. TAYLOR.

It has long been recognized that the process of milling is superior to any other for machining metal because the metal can be removed at a much higher rate of speed than by any other method,

Fig. 1.—High Speed Inserted Steel Helical Blade Milling Cutter, 8 in. Diameter, 3½ in. Bore, 18 Blades.

and as the operation of cutting is continuous, milling cutters being made up of a multiplicity of cutting edges, work can be machined at a much lower time cost. After the advent of high-speed steel, builders of milling machines, especially those of the planer type, began to offer high-powered milling machines, and to-day it is a very common thing to see a milling machine whose spindle is

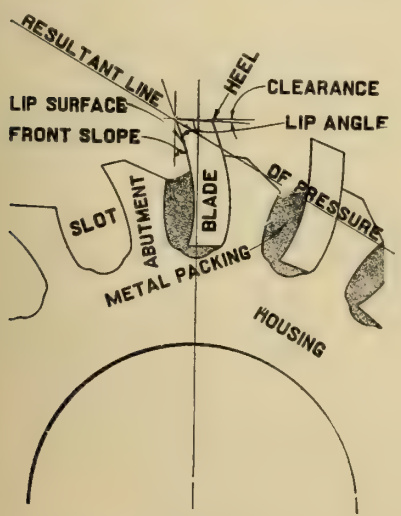

Fig. 2.

driven by an individual motor of from 50 to 75 h.p. capacity, whose platen is driven by an independent motor of from 7 to 15 h.p. capacity and whose cross-rail is raised and lowered by an individual motor of from 3 to 5 h.p. capacity. While the milling machine has been developed to high power and high speed, the milling cutter has not advanced as rapidly ; the user is thus confronted with a very unsatisfactory condition, the output of his milling machine being limited to cutters of inadequate capacity. This condition results from faults of design lying in the shape of the blade and method of fastening. This criticism applies to the inserted blade type of cutter, which by reason of its cheapness in first cost and maintenance has been universally adopted for heavy slab milling.

In 1892 George Brechtol developed a

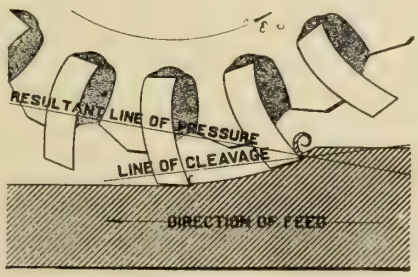

Fig. 3.

milling cutter of the inserted-blade type, in which the blades were made of carbon steel, properly shaped and secured. The results obtained at the time were considered extraordinary, being far in advance of those obtained by other types of carbon steel cutters. His cutter consisted of a malleable iron core, bored and keyseated, into whose body were planed 8 helical dove-tail grooves, considerably wider than the blades. The blades were bent around a cylinder to the desired helix. They were set inside a cylinder and properly spaced by means of blocks ; the core was then set in position and soft metal poured, filling the dove-tail grooves and the spaces between the blades.

C. D. Peck was the first to develop successfully a milling cutter of the inserted-blade type for heavy slab milling, having high speed steel blades, helical in shape. The paramount feature in Mr. Peck's cutter was the helical shape of the blades. He planed helical slots, rectangular in shape, in a steel housing, inserted therein high speed steel blades bent to fit the helix of the slot, and held them in a rigid position by means of wedges inserted at intervals between the front face of the blades and the side of the slot, filling the spaces

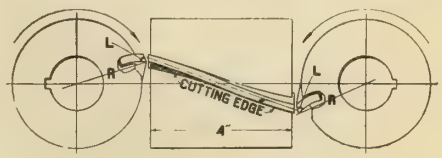

Fig. 4.

between the wedges with soft metal. Mr. Peck designed and built a hand press for bending the blades, which consisted of a pair of lateral jaws encircling a shaft ; one of them stationary, the other actuated by a lever and toggles so as to close upon the blade to form a helix.

His first cutter was built at the Pittsburg works of the American Locomotive Company in 1905, and from tests made at the time, the results were far in excess of those obtained from other types of milling cutters with inserted blades, both in material removed in a specified time and in power consumed per cubic inch of material removed. He proceeded to build more cutters and put them into use, having conslusively demonstrated by continuous operation that the capacity of these cutters for removing metal was not only far greater than that of other types of inserted blade cutters, but in excess of the capacity of

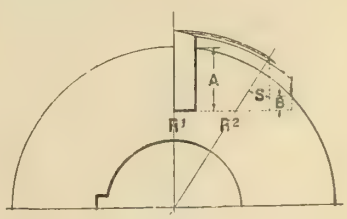

Fig. 5.

the modern type of high-powered milling machine.

Early in 1907 Mr. Peck had a conference with the manufacturers of the Taylor-Newbold cold saw, who were developing a milling cutter of the inserted-blade type, and the conference resulted in Mr. Peck turning his developments over to the Taylor-Newbold people. It

* Paper read at the New York meeting of the American Society of Mechanical Engineers.

was from this combination that the milling cutter about to be described was evolved. See Fig. 1.

Our primary investigations showed that there was no existing standard, or suitable rule, governing the construction of milling cutters with inserted blades, nor was there any record of exhaustive tests made to determine the most effective pitch, proper clearance angles, or front slope and lip angles to be employed, and judging from past and present constructions in milling cutters of the inserted-blade type, the functional elements are merely arbitrary selections to suit individual tastes.

We also found the prevailing practice in constructing milling cutters with inserted blades to consist of cutting rectangular slots in a cylindrical housing, the slots lying in a plane angular to the axis. The angle from the axis at which the plane is set varies from, 5 to 25 degrees, according to the length and diameter of the housing. The blades are straight pieces of high speed steel, which are ground off after being inserted in the slots until a definite projection from the housing along the cutting edge is attained, after which clearance is obtained by "backing off."

The blades are held in position by various methods, such as clamps placed between each alternate pair of blades and drawn inward by screws; or by cutting grooves in the abutment between each alternate pair of blades and forcing the parted abutments by means of taper screws to clamp the blades on either side; or by driving wedges between the front face of the blade and the side of the slot; and by numerous other means.

We also found that much can be learned and applied to milling cutter blades from the development of the lathe and tool, especially the round nose tool; a fact totally ignored by the manufacturers of milling cutters, who still try to accomplish the impossible—that is, setting a straight blade in a slot with its front face in a plane angular to an axis, throughout its length the proper front slope and lip angle, and define a helix on the line of the cutting edge.

The first point which we considered in constructing the cutter to be described was the shape of the blade, with the following conclusions: To maintain a

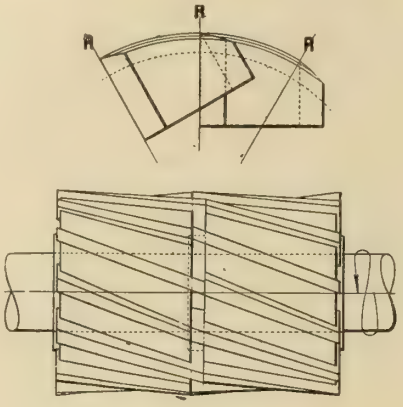

Fig. 6.

prescribed slope and lip angle throughout its entire length, the blade must be bent to form a helix, and by so shaping it all angles and the contour of both blades and slot would be constant over their entire lengths. Again, with the blades helical in shape, a continuous cutting edge with a constant lip angle would be maintained throughout any length of cutter.

The second point for consideration was the pitch or lead of the blade, and from experiments with various leads we found an effective angle for the helix to be about 20 deg. To facilitate computation, we adopted the formula, diameter multiplied by 9 equals pitch, which would develop 19 degrees 15 minutes as the angle of the helix.

The third point was the form of the grooves in the cutter blank. These had previously been placed approximately rectangular in section with a slight amount of undercutting to hold the blade and the wedges used for fastening it in place. It occurred to one of us, however, that this grooving of the cutter blank could be done better and faster by milling than by planing, and that an undercut groove might be produced at once by a saw set in a certain relation to the cutter blank. This suggestion was soon proved practicable, and although the groove so formed was not so easily fitted with a cutter blade on account of its curved sides, the curved sides gave the cutter a lip angle which was of great value in actual service. To form the blades accurately to the shape of the groove, it was necessary to design a bending machine of great power, capable of squeezing the blades at once to proper form not only as helices of correct pitch, but of correct curvature in a direction normal to the helix.

This machine was made to act in one way like the original hand-bending machine made by Mr. Peck, but in addition to the lateral jaws which closed on the blade to form the helix, it was provided with a cap which snapped quickly upon the lateral jaws, completely enclosing the blade being bent to proper form. Time is such an important element in the handling of high-speed steel that the value of this bending machine, which was quick enough to act before the temperature of the steel had fallen below the working point, can hardly be over-estimated.

Special furnaces for treating our blades were designed and built under the Taylor-White patents, but we are not at present so much concerned with the ap-

TABLE 1 SLAB MILLING CAST IRON. TAYLOR-NEWBOLD HIGH-SPEED STEEL MILLING CUTTER, 8-IN. DIAMETER, 18-IN. FACE 18 INSERTED BLADES. TEST MADE AT BEMENT-MILES WORKS, JULY 13, 1908

paratus for manufacture as with the results obtained.

The fourth point for consideration was the method of securing the blades. Mr. Peck's experiments showed metal wedges to be neither satisfactory or economical as a means of securing the blades. While installed with ease they are exceptionally hard to remove when necessary to replace blades, owing to their tendency to imbed themselves in the housing. Furthermore, by driving them in at intervals along the high speed steel blade intermittent strains were developed, causing the blade to crack and spall off at the point of contact between the wedge and blade when under cutting pressure. Other mechanical fastenings were debarred either by excessive cost or by inability to withstand vibration and remain rigid.

Experiments were made with various alloys until a proper combination was obtained, capable of flowing freely, cooling without shrinkage, withstanding great strains without crumbling and being removed quickly and economically.

A device was designed for compressing the alloy in the slots after it had been poured, and a device for removing the alloy when replacement of blades is necessary. With the alloy compressed in the slots we are able to secure the blades in an anchorage sufficiently rigid so that the blades may be broken off by sheer force without affecting it. This form of construction enables us to produce a cutter of moderate diameter free from torsional strains and with a greater number of blades for a given diameter, and possessing a capacity in excess of the requirements of high-powered milling machines.

The milling cutter in question will be referred to here as a "Helical" rather than a "Spiral" cutter. The prevailing practice is to use these terms synonymously, but geometrically they are not even analogous ; a helix is a line generated by progressive rotation of a point around an axis and equidistant from its centre, while a spiral is generated by progressive rotation of a point around a fixed axis with a constantly increasing distance from the axis.

Fig. 2 shows the meaning of the following terms : Housing body of cutter; abutment—support of blade ; metal packing—anchorage ; slot ; blade ; heel of blade ; clearance angle ; lip angle ; front slope ; lip surface and resultant line of pressure. The side slope is defined by the angle of the helix.

Fig. 3 shows how the chip is partly torn and partly sheared from body of forging, the cutting edge of blade not being under heavy pressure. Our experiments hgve shown conclusively that the closer the centre of pressure of the chip is to the cutting edge, the greater its intensity, and the generated heat is largely concentrated towards the cutting edge, where the sectional area to carry it off is much less. Then again the frictional heat generated by lack of back slope becomes so great as to cause cohesion between the chip and the cutting edge. Under heavy pressure we have seen a compact of chip and blade which was virtually inextricable, so that when disunited from the blade the cutting edge still adhered to the chip. To eliminate this condition where straight blades are employed, the practice is to set the front face of the blade slightly back of a radial plane (see line R, Fig. 4) to assure a front slope. It is well known that the absence of front slope eliminates any proclivity which the lip may have to develop a line of cleavage and thereby throw the pressure of the chip back on the lip surface from the cutting edge.

Fig. 4 shows a constant lip angle L throughout the entire length of the blade which is set at an angle of 20 deg. to an axial plane, this angle remaining constant throughout any length by reason of the blade's curvature.

In Fig. 5 a straight blade is set in a plane radiating from the axis, designated by line R1, and by carrying it across the face of the housing at an angle set at 20 deg. to an axial plane. You may observe the development from no front slope to a positive front slope, designated by the letter S. In milling, a blade with this irregularity in front slope causes the cutter to drag on one side and gouge on the other. Blades of this type cause excessive vibration to the cutter, due to the varying angle of the front slope, and necessarily consume more power. It has been contended that by nicking the blades to alleviate the tendency of the blade to gouge and drag, and to define a more even pressure throughout the line of the cutting edge, less power would be required to drive the cutter ; the assumption being that less power would be consumed in breaking up the chip than would be required by a continuous cutting edge producing a continuous chip.

We differ with this contention, having demonstrated conclusively by experiments that the initial fault is caused by absence of front slope, and that an undesirable feature is developed by nicking the blades. The blade behind the nick whose cutting edge covers the gap formed by a nick in the blade preceding must accept double the feed ; this causes chatter and produces an uneven machined surface.

It is also a fact that when a rectangular slot is cut in the face of a housing at an angle of 20 deg. to an axial plane, its depth becomes gradually less as it progresses across the face, until it reaches a vanishing point designated by lines A and B in Fig. 6. This condition not only limits the width of the cutter and necessitates a housing of large diameter when a medium width of cutter is required, but develops an anchorage possessing the required strength and rigidity at one side and decreasing in proportion to the length of blades at the other. Where a wide face is required it is necessary to construct a cutter composed of a number of sections.

Fig. 6 illustrates a cutter with straight inserted blades made up in sections, each alternate blade overlapping the blades in the opposite section, so as to obtain the desired width of face. The sections are so set that the cutting edge forms a continuous line. Above the cutter is a diagram showing the relation of the blades in one section to those in the other.

Too much stress cannot be laid on the use of lubricant during the process of milling. A copious stream of lubricant falling at slow velocity should be thrown directly upon the chip at the point of removal. Heat generated by the pressure of the chip is the chief cause for wear, and if allowed to become too great it will soften the lip surface of the blades and cause them to crumble or spall off. An ample supply of lubricant during the milling operation carries off the heat, materially lessening the dulling of the cutting edges.

From our experiments and those of others it has been conclusively shown that a gain of 33 per cent. in the cutting speed in milling steel and wrought iron is made by throwing a heavy stream of lubricant upon the cutter and along its entire face; and a gain of 15 per cent. in milling cast iron. The piping for conveying the lubricant to the milling cutter should be arranged with nozzles spaced about 4 in- apart, in sufficient number to cover the face of the cutter. The main supply pipe to the nozzles should be large enough to supply each nozzle with from two to three gallons of lubricant per minute. The general arrangement, size of supply pipe and number of nozzles will be regulated by the width of the machine and the nature of the work to be done.

In the more recent designs of slab milling machines due consideration has been given to lubrication. The platen is drained by gravity to a tank located at the side of the machine, from which the lubricant is raised by a pump to a reservoir formed by the cross-piece at the top of the housings, to which is attached the nozzle bracket that conveys the lubricant to the required point of gravity.

In the tabulated tests the amount of power consumed by the milling machine will be given as read from the voltmeter and ammeter. Dynamometer readings of the actual power exerted at the spindle, or the power consumed by friction in the gearings and bearings, will not be given consideration; the user being most interested in the commercial readings that indicate the power for which he has to pay.

ELEMENTS IN THE VALUE OF A MANUFACTURING PLANT.

By Charles T. Main.

Into the market value of a plant enters the broad element of location, with its varying hours and price of labor; skill and abundance or scarcity of operatives; cost of transportation of raw material, supplies, and finished product; cost of fuel or power; cost of construction and equipment; and rate of taxation. Also the narrower and more restricted element of the physical condition of the plant and its relative value to a new plant constructed upon modern principles, and constructed with all regard to the economical production of a finished product of the best quality of the goods manufactured. The standard of value should be a modern mill so constructed and located as to avail itself of as many combined advantages as possible.

The ultimate value of a plant is its capability of producing a profit, and into the possibility of producing a profit enter all of the above items and perhaps some not mentioned.

The question of management is a personal one, and must not enter into the problem, except so far as to make sure that with good management the business would be successful. The business of a large and valuable plant might be conducted in such a manner as not to realize a profit; but it might, nevertheless, have a great value, and would bring a large amount if offered for sale. On the other hand, a plant not nearly so valuable might, with skilful and close management, yield a profit; but if offered for sale would bring very little. Although the past profits of a concern will have some influence in determining its value, that is not a measure of its value; because a purchaser might by different management reverse the profit or loss, or the changes, real or anticipated, in trade might do the same thing. We must therefore eliminate as far as possible all personal equations from the problem.

PERSONAL.

Mr. Arthur Knight, formerly superintendent of the foundry of the Manitoba Iron Works, Winnipeg, Manitoba, Can., has taken charge of the foundry of the Canadian Northern Railway Co., of that place

W. O. Barnes, M.E., engineer in chief of the Ross Rifle Company, Quebec, has resigned and will form a company to manufacture gas engines of his invention for which he has obtained Canadian patent rights.

Mrs. Frances A. W. McIntosh, formerly advertising manager of the Buffalo Forge Co., and associate companies, has resigned that position to open an office at 103 Anderson Place, Buffalo, where her services, in the preparation and printing of advertising literature can be secured.

A Boring Mill and Planer Combination for Large Work

A Home-made Boring Mill used in Combination with a 72" Planer. Construction of the Mill and Class of Work Finished on the Machine.

The Smart-Turner Machine Co. of Hamilton, are builders of all kinds of pumping machinery and do a general machine business. Among other things they manufacture for the Canadian trade, a cold tin setter for a United States firm. This is a heavy hydraulic machine weighing approximately 7 tons finished. The first lot of these were machined in a brake lathe of 6 in. swing. The head of the lathe was raised and the assembled tin setting machine bolted to the face plate, and its outer ring view on roller bearing bolted to the foot plate of the lathe. This did a fair job, but was slow, the time taken being about 80 hours. The heads of the firm designed the boring mill shown in place on the planer bed in the half-tone, Fig. 1. This machine has reduced the time of machining to about 18 hours, and does better work. It has also been used to good advantage on other work.

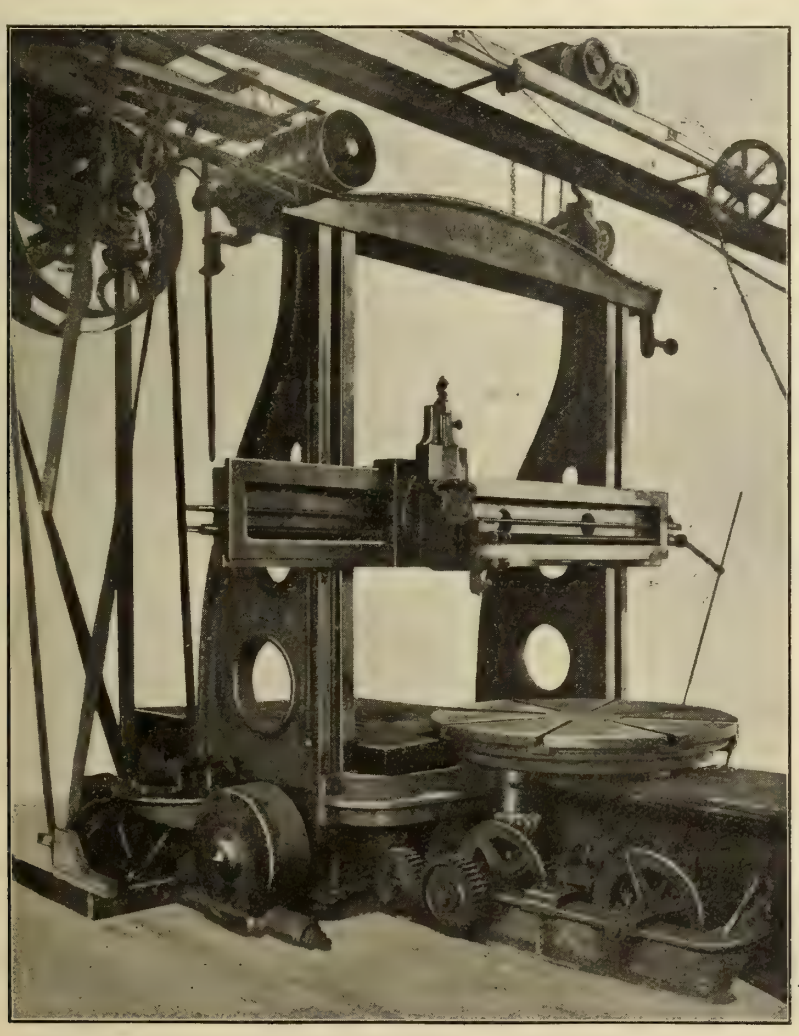

Fig. 1.—Planer, Showing Boring Mill Attachment.

The construction of the table and bed Fig. 4 is like that used in most Boring Mills, i.e., a V on the lower side of the table travelling in a V-groove in the bed piece, with a central stud with washer and nut on its lower end. The V's were carefully machined to templates, and scraped and ground. The bottom half of the Boring Mill bed is fitted to the ways of the planer bed, and connected to the planer standards by a cast iron knee on each side. These knees are planed on the face that are fitted to the standard and have chipping strips where they joined the Boring Mill.

After fitting the space between the chipping strips were filled with babbitt making a solid joint. The Boring Mill is not bolted down to the planer bed. The driving gear is shown in Fig. 6. The 4 inch bull wheel shaft is bored 6 inch deep and a 2 3-16 shaft driven in and pinned with $\frac{5}{8}$ dowells. The holes

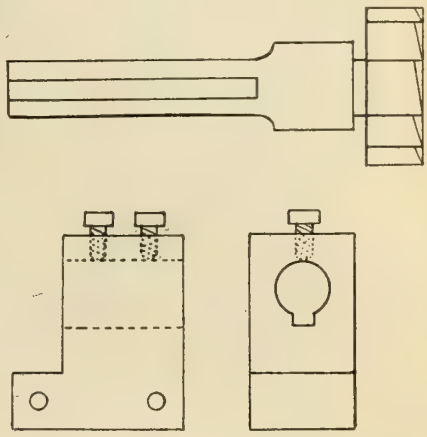

Fig. 2.—Milling Tool and Holder.

were drilled off center leaving $\frac{1}{2}$ the diameter of the dowel in the 2 3-16 in. shaft to prevent shearing. On the outer end of shaft is a driving gear B.

The second shaft has a step bearing bolted to the planer bed and carries a spur gear and bevel gear.

Keyed on the bevel gear and a spur pinion shown in Fig. 4 are on a vertical shaft. The spur pinion drives the table through the internal ring. This ring bolted to the table with $\frac{3}{4}$ cap screws, spaced 8 in. centers. This gear drive and frame are on a concrete foundation and the frame is bolted to the side of planer bed.

As shown in Fig. 6, it is a double drive the right hand drive, as shown,

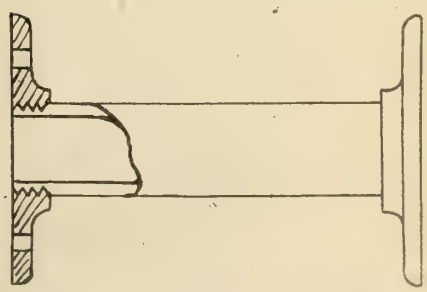

Fig. 3.—Extension Attachment.

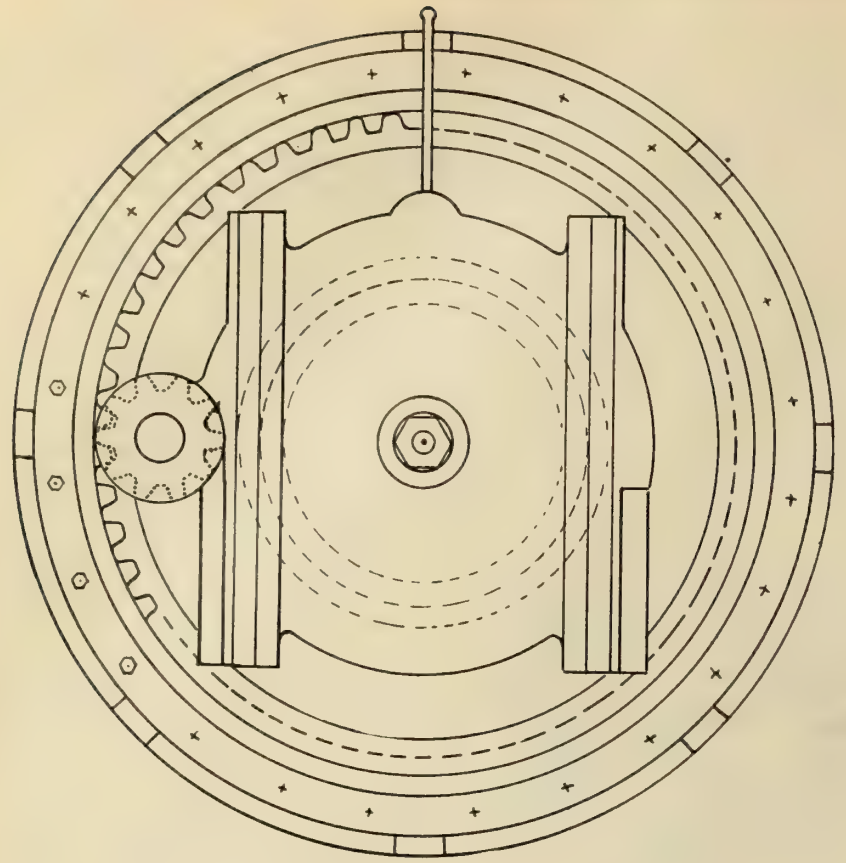
is used when on work over 84 in. diameter. The boring mill is moved back on the planer bed in line with the shaft on the right and the drive is through the two bevel pinions and so



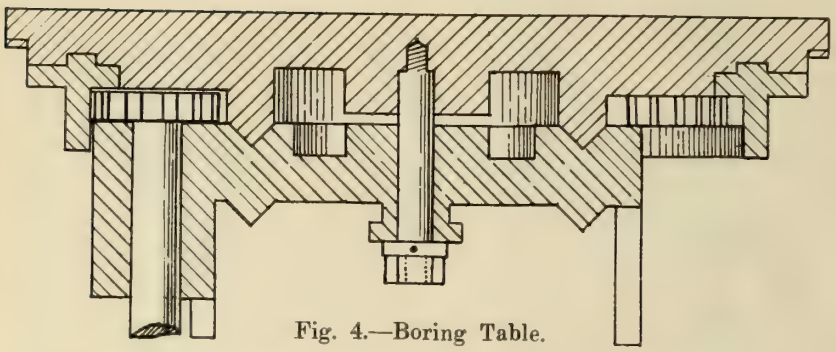


Fig. 4.—Boring Table.

to the ring. The tools used are the same as used in planer work and used in the planer head on the cross rail. The cross and down feed is transmitted through the two screws in the rail, from a ratchet wrench attached to the square on the end of the screw. On the outer end of the ratchet is a swivel stud through which passes a ½ inch round rod held by a set screw, and connected to a cross shaft with a finger or bell crank on each end. This shaft is carried in two bearings on one of the cast iron knees, connecting the boring mill to planer standard. The fingers which operate the bell crank are CRS cut to length and set in the slots of the table To increase the feed, increase the fingers.

Besides the work for which this machine was built it has been used to face large centrifugal pump shells and for counterboring for the covers of the valve chambers of large duplex pot valve pumps. Fig. 2 shows the tool and holder used for the latter work. The holder fits the head in place of the clipper block and is held solid with 2 taper pins. The work is centred on the table and the tool fed to the depth required.

A 9 ft. 5 in. fly wheel of 2½ tons weight was machined in this mill. This wheel had considerable over hang and chattered somewhat until the gear drive was helped out by a rope drive taken from a nearby Radial using a 24 in. sheave on an arbor in its spindle and running direct on the rim of the fly wheel. To bore this wheel an extension head Fig. 3 was made of a piece of 8 inch W. I. pipe and 2 flanges. The flanges were threaded, shrink or faced to length and drilled to suit the head. The head was put on the outer end of the extension with the holder Fig. 2 in place of clapper block. This holder is bored for a 3 in. bar making it a very stiff tool and allowing the use of the bars and toolholders of a 42 inch Bullard mill which is part of the shop equipment. These jobs are handled on the combination machine in better time than in the lathe. There are four changes of gear shown in Fig. 6, which handle a wide range of different diameter of work and keep the cutting speed nearly right. The gears are 3 pitch 3 in. face. The cost of the attachment was under $300, and the time required to set up or change from planer to Boring Mill is less than two hours.

J. E. Ruby, manager of Frost & Wood, Winnipeg, has been transferred to the head office at Smith's Falls, Ont., where he will have charge of the sales department.

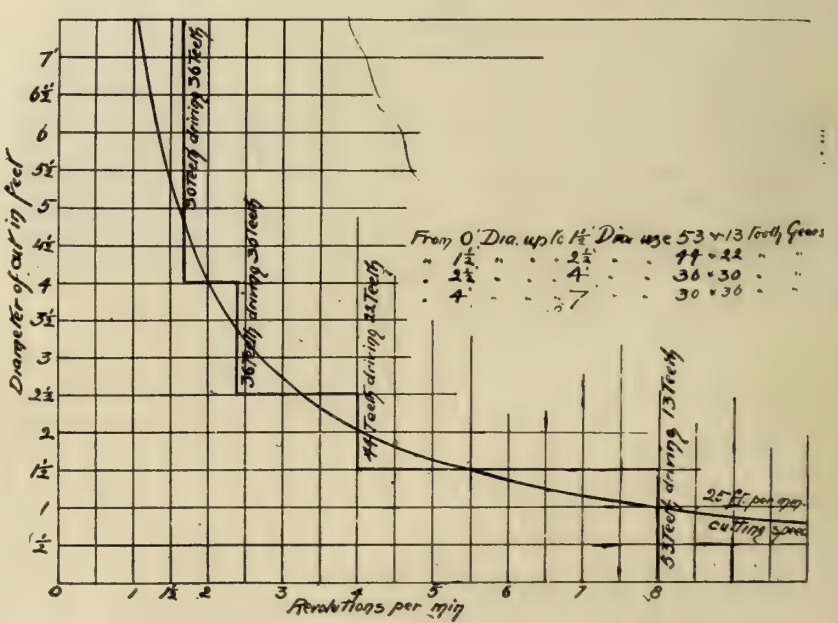

Fig. 5.—Change Gears for the Combination Machine.

ADVICE TO YOUNG MEN.

By J. M. Mackie.

While this is unquestionably an age of large corporations, I firmly believe it would be better for the future prosperity of Canada if more encouragement were given to the young men of this country to start manufacturing some one special machine in a small way. The press is continually heralding the advent of big enterprises, and our young men are inclined to forget that the great majority of our large enterprises had very small beginnings.

The manufacturing of power house equipment in Canada during the past ten or fifteen years has been very discouraging to the Canadian manufacturer for various reasons, some of the causes have been beyond the control of the manufacturer, but other causes of unsatisfactory results have been overlooked in the burning desire to be big and great.

The method adopted to achieve greatness in the iron trade in Canada has been by manufacturing a large line of various machines, instead of specializing and concentrating all energy in the development of some particular line.

I think I am safe in claiming that no branch of manufacturing has gone through such a complete revolution in the past twenty years, and is now specialized to such an extent as the manufacturing of machinery.

Twenty years ago the purchaser of an engine would visit a machine shop and tell the proprietor the kind of engine he wanted and every detail would be made on the premises, even the bolts and nuts were forged by hand and finished in the shop. To-day an engine is often shipped the day it is ordered, and the average manufacturer only builds one type of engine, which is of his standard design and will not be changed to suit the whims of every purchaser.

The evolution in methods of manufacturing machinery has been perhaps as complete in Canada as in other countries, but the mistake being made today by most Canadian manufacturers is in attempting too much.

In the old days a manufacturer prided himself in being able to build any kind of a machine, and our machine shops have not felt disposed to drop the manufacture of any of their various lines, but have tried to specialize them all. Perhaps our northern climate has made us over ambitious, the result is that we have not specialized any one particular line to the greatest possible extent, and our neighbors across the line were able to ship into Canada last year several million dollars' worth of machines which could have been manufactured in Canada. Our imports of machinery will continue to grow until we specialize more thoroughly.

Let no young man shrink from commencing to manufacture in Canada in a small way any machine which he knows to be equal to the best, and for which there is a good demand, because by persevering in one line, special knowledge will be acquired and will bring special results, and the small industries of today will become large enterprises in the future of Canada.

If a man works for a living—that's all he gets. The fellow who reaps the prizes is the fellow who enjoys his work and is sorry when it's time to quit.

Not the biggest brain, but the best trained mind most surely brings success. The lamp in the headlight isn't any larger than many other lamps, but its light is trained where it is most needed.

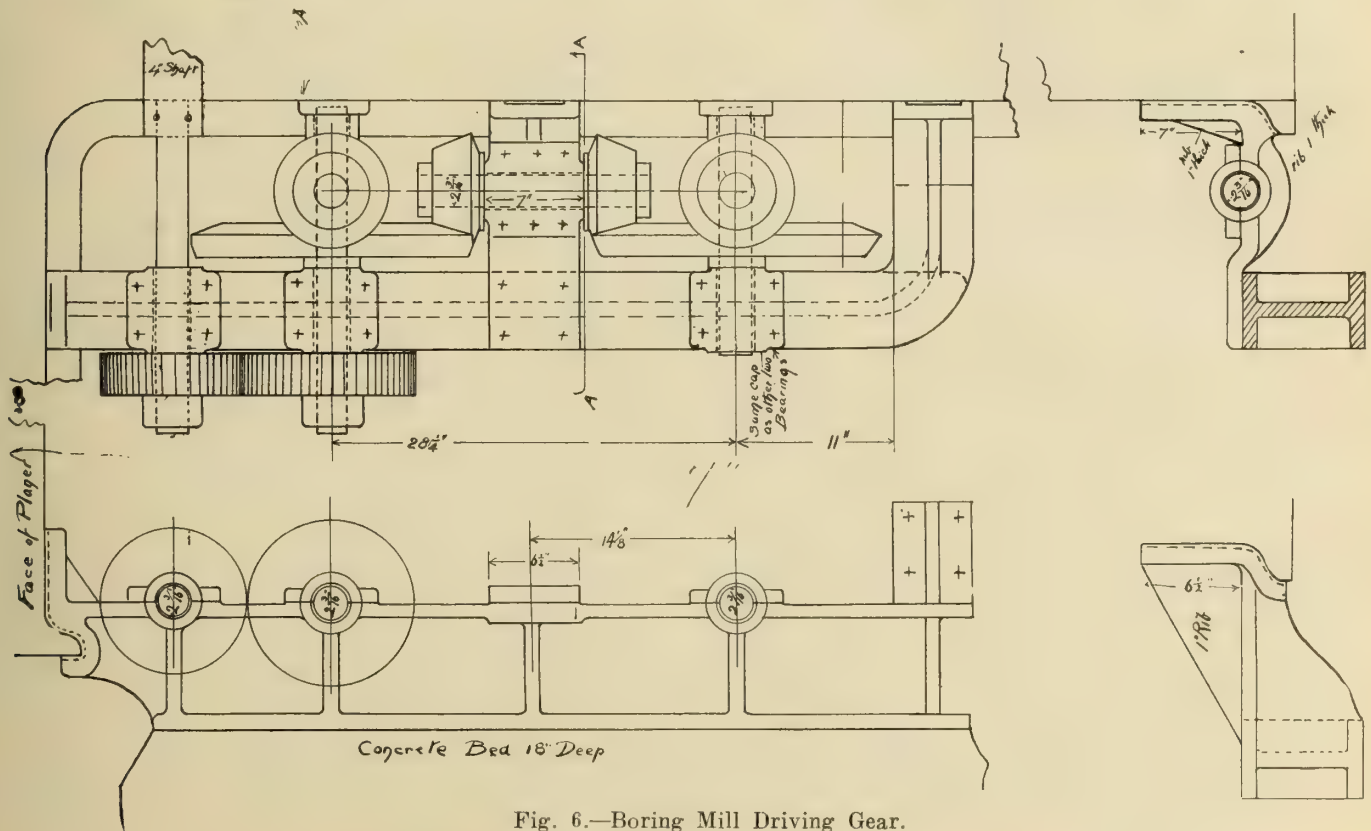

Fig. 6.—Boring Mill Driving Gear.

The man who loves his work, who glories in it, is bound to succeed. You can't hold him down.

Enthusiasm is the power that drives our mental machinery. It is the force that brings things to pass Lack of it may be the one thing that holds you back from the fullest success in life.

No man can be a success in a position unless he is in love with his work, unless his best thought is devoted to it, unless he finds pleasure in doing it and doing it well.

Tools and Methods Used in Forming Irregular Work

Machinery Pieces of Irregular Outline—Tools used on Various Machines, Turrets, Milling Machines, Etc. — Methods of Producing the Tools.

By JOHN EDGAR.

With the increase in the facilities for the production of work of irregular outline, this class of work has become more common. The increased rigidity of the lathe and the rapid introduction of the turret lathe have made it possible to produce turned work of this character at a cost almost as cheap as that of regular cylindrical shapes, while the use of the milling machine makes it possible to produce flat work of an irregular cross section with comparative ease when supplied with proper cutters.

Some of the methods employed both in the use of and the production of the formed tools and cutters may prove of interest.

Form tools owing to the nature of the cut, being generally quite broad, their support must be very rigid and devoid of all vibration. The whole success of the process depends to a great degree on the means of support. For this reason attempts that have been made in the past on the engine lathes of older design have been invariably a dismal failure and have, in all cases except those of dire necessity, been abandoned. Not only must the tool be supported well, but so must the work be supported close to the cut. So much trouble had been experienced in forming this class of work that the hand tool was invariably used, if not in roughing out the shape to finish it. Now the tools are held so securely that it is a complicated form that requires a roughing and finishing cut, one tool being used from start to finish and produces work that requires but the touch of emery cloth to bring it up to

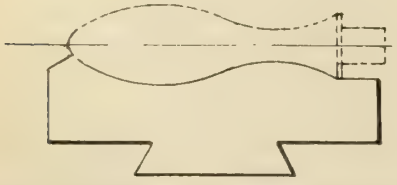

Fig. 1.—Form Tool for Machine Handle.

a bright finish. Chalter marks are conspicuous by their absence.

An Example of Formed Lathe Work.

Fig. 1 shows a familiar example of formed lathe work, the machine handle. The tool shown is as used in a turret lathe which performs the operation automatically working on bar stock. The operations are as follows: The end is faced and the cylindrical part turned to the shoulder, this done the turning tral gives place to a roller steady rest that supports the end during the forming operation, which is next in order. The absence of vibration in this machine allows the chip from the forming operation to continue in one piece until it either breaks of its own weight, or by catching in some obstruction. This must also be accredited to some extent to having the forming tool cutting edge ground and set with a proper cutting rake.

Instead of the old style forming tool with shank held in the tool post of the lathe, we now have the tool held in a dovetailed recess in a massive block which is securely bolted to the slide. This method of holding the tool is shown in Fig. 2. The face of the block in which the dovetail is planed has an angle of about 5 degrees with the vertical and the cutting edge of the tool has a top rake of 3 degrees with the horizontal or 82 degrees with the face. This cutting rake is right for the general run of work, but may require altering for work on hard stock, when the tool may be made with little or no rake. A tool of the design shown has longer life as well as being more rigid. When the form is very irregular and where the tool cuts near the center of the work in some places, it will be best to have the top face of the form tool flat, with out rake, as the difference in the diameter of the form would cause the cutter to drag or scrape the metal on the outer diameter, because it would then be below the center, instead of having a good cutting action. However when the shape of the work will allow, the angle of rake given above should be used. In cases where the reproduction of the form must be accurate the top rake must be zero unless the form is made to counteract the difference caused by the angle of top face. This feature will be taken up in connection with the making of the tools.

In hand turret lathes which work from the bar, the forming tool holder is generally of a special design peculiar to the difficult makes. In some machines provision is made for two form tools, one roughing and the other finishing, both working at the same time. The roughing tool is generally made with stepped cutting edge tending to break up the chip reducing the power required and also the strain on the work and machine. In cases where the cut is of great length the above method

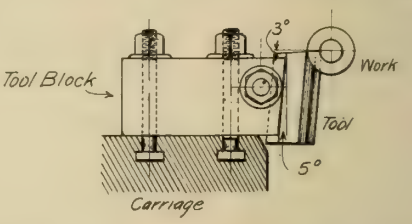

Fig. 2.—Form Tool Holder for Lathe.

is to be recommended. A cut like that shown in Fig. 1 would impose more heavy pressure on the tool and work than one in which the outline was more irregular with sharp corners, because the chip would be more broken up and divided into strips than in the example shown.

Tool for Small Automatic and Milling Machines.

For use in small automatic machines and for heavier work of short length the circular form tool shown in Fig. 3 is made. This tool is set with the center above the center of the work and the cutting edge on the center of the latter so as to provide for clearance. As the cutting edge wears and is reground the tool is revolved on the shank to bring the cutting edge again to the proper level.

The cutter used in the milling machine for producing formed work, may be one of two kinds; either with formed relieved teeth or with formed milled teeth. The former being ground on the front face of the teeth and with out changing the form while the latter must be sharpened by grinding on the peripheny, the wheel following the form and reproducing it. The former is the one most commonly used and is to be perferred, but in many classes of work the latter with milled teeth is much used, namely in gun-shop and arsenal work.

Making Form Tools.

The methods of producing the formed profile of the tool will now be described. The process of producing the form tool will depend to a great extent on the

use to which the tool is to be put and to the accuracy with which the desired form is to be reproduced. Thus in the case of form tools for making tap or reamer cutters it is not necessary to use as much pains in making the form exactly to the sketch as would be the case in making the tools for gear cutters, which must produce gears that

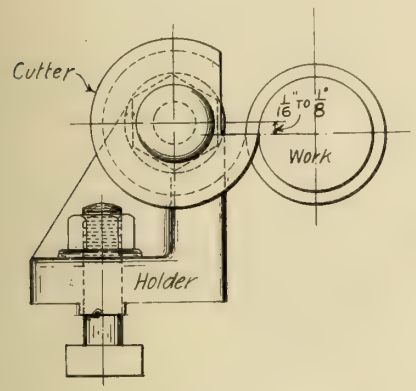

Fig. 3.—Circular Form Tool and Holder.

will run smoothly without noise. In one case we are making tools to remove superfluous metal, the exact profile of cut being just as well suitable for the purpose with slight variations as when made precisely like the sketch or model, but in the other case any variation from the sketch or layout would be a source of trouble that must be avoided by accuracy of reproduction.

As an example, let it be required to make tools for forming the milling cutters used in fluting taps like Fig. 4. A lay out of the form is made on thin sheet zinc or brass. In order to make the lines show up more distinctly the sheet metal is first given a thin coat of etching varnish which leaves a black surface upon which the lines are scratched with a sharp scriber. A template should be then filed out the exact shape that the cutter is to have as shown in Fig. 4 by the dotted lines. In making templates it is best to have the sides or at least one side square with the cutting edge, so that it may be set and tested by a square or straight edge. Thus in Fig. 4 the template is made wider than the desired form by a considerable amount in order to have edges at a convenient location from which the squareness of the form may be tested. This will become evident as the article proceeds.

Now proceed to make the planing tool. This tool is used in planing the form tool used to form the cutter. This tool may be made to fit the tool block of the shaper or planer, or it may be used in the fly cutter holder shown in Fig. 5 and used on the milling machine. In the latter case it is used as a milling cutter and is then termed a fly tool or cutter. This is a master tool and is reserved for making form tools when new ones are required.

This planing tool is generally made of stock $\frac{5}{8}$ or $\frac{3}{4}$ of an inch thick and as wide as the form requires, and about $3\frac{1}{2}$ or 4 inches long. It is planed on all sides square and either provided with a shank or with suitable holes drilled in it as means for holding it in position when in use. These tools should be made of well annealed tool steel.

The end of the tool which is to be formed is now given a coat of copper upon the top face by applying a solution of sulphuric acid. Remembering that this tool is to have the same shape as the cutter, scratch the outline of the form, using the template as a guide, getting the form transferred square with the sides of the tool.

The block of steel is now set up in the shaper so that the end may be planed with a clearance of fifteen or twenty degrees. Then with the tool so set follow the outline of the form as closely as possible without touching or running into the lines.

Having blocked out the form roughly it is now necessary to file it to the shape desired. The tool may be held in the vise during this filing operation, or may be clamped to the bench in the horizontal position, whichever the workman finds more convenient. The filing should be done with the cutting stroke away from the cutting edge as this not only leaves the lines visible, but also throws the burr on the under side of the tool. Care should also be taken so that the clearance is kept constant and frequent trials with the template be made as the form nears completion. The easiest way in which the template can be compared with the outline of the tool is by holding up to the light and noting where the contact of template and tool exclude the light. These places are obviously the high spots and must be filed away. Too much should not be taken off any spot without again comparing with the template, as daylight can be seen through very small spaces and the effect on the eye is that of a wide space, especially when the light is bright and concentrated as in holding the work up to an artificial light or bright sunlight.

After the form has been produced in the planing tool to the degree of accuracy desired the latter is hardened and tempered. It should be drawn to a light straw color in temper. If made too hard the edge is apt to crumble away or chip. After tempering, the edge should be brought up keen with a stone. Oil stone chips are used in stoning and the best results are obtained when kerosene oil is used as a lubricant. The heavy machine oils are poor lubricants for stones as they fill up the pores. Stones that do not cut freely because of this gumming up may be restored to good condition by soaking in kerosene. Some toolmakers use naptha or gasoline for this purpose, but owing to their low temperature of ignition and their tendency to evaporate quickly, are not to be recommended. If a surface grinder is handy the top of the tool and also the bottom should be ground off straight before stoning the edge. This tool should be sharpened when worn by grinding across the top.

Making the Form Tool.

Having finished the planing tool the form tool may now be made. Tools used in relieving formed milling cutters must have a greater angle of relief than for ordinary work. This is on account of the peculiar process that is used in forming the relief of the tooth. This is generally done by causing the form tool to dig into the cutter blank as each tooth passes. An angle of twenty degrees may be considered sufficient as clearance for tools of this class.

The face of the form tool may now be planed. If the tool is to be held in the tool post of the lathe as an ordinary tool it must be planed with the desired angle of clearance on the end, but if held in the holder shown in Fig. 2 it is planed parallel with the back, the clearance angle being provided in the holder. The form tool after being given

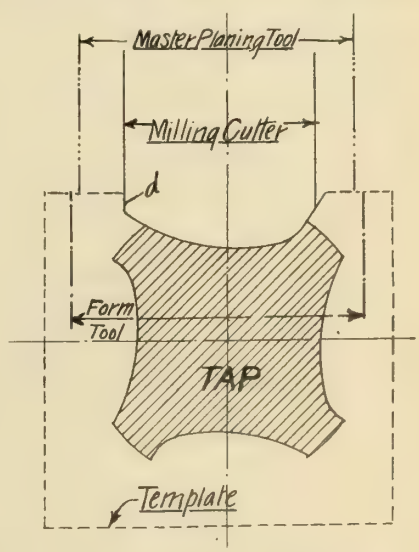

Fig. 4.—Tap Section, Template and Tool Layout.

the form required is hardened and tempered and ground ready for use.

In order that the form produced by the form tool may be a duplicate of the sample or template, the section through the form tool on which the template matches must lie in a plane through the axis of the work, or must

be perpendicular to the direction of travel of the tool in planing or milling. If it lies in any other plane the cutter does not reproduce its own form.

Fig. 6 shows the difference in form. In the case just treated the error is so little that it may be overlooked, but in cases where it is desired to reproduce the exact form, correction for this error must be made. There are differ-

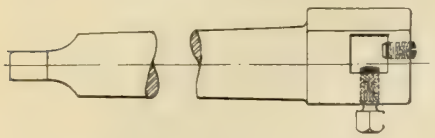

Fig. 5.—Fly Tool Holder.

ent ways of doing this. We may, if the form is not too complicated, project the correct shape from one plane to another at an angle with it, equal to that of the clearance, giving the shape for the planing tool. This method is one that requires care and skill in drafting. A simpler method would be to hold the template, in filing the planing tool, at an angle to the top face equal to the clearance angle of the form tool as shown by the heavy line in Fig. 6 at (a). In filing a tool with the template held in this manner care must be taken that the form is parallel from top to bottom of tool. The error exists also in the case of the circular cutter shown in Fig. 3, as the cutting edge is off the centre of the cutter and reproduces a form on that line. The turning tool used in forming this cutter may be treated in the same manner as the planing tool above.

In reproducing a form of symmetrical shape it may be best where it is desired to be exact to make a master tool of but one half of the form, and with this plane out the planing tool. In this case the master tool would be filed and fitted to a template of the shape on one side of the symmetrical centre and projecting a slight amount on the other side for purposes of gauging the cut. The planing tool would be roughed out approximately to shape and one-half of the form planed in to the required depth. The planing tool would be reversed in the vise and the other half planed. To facilitate matters in obtaining proper depth for the second half of the cut, the first half may be given a coat of copper which when scraped by the master tool in the second operation, would indicate that the proper depth had been reached.

In gauging the proper width of the form we may resort to several methods, any of which have advantages depending on the particular case in hand. First, we may scribe the line of symmetry on both the master tool and upon the piece we are planing and by matching the lines we may locate the tools. Some forms may lend themselves to easy measurement, in which case it should be done as a means of checking the results.

Long and Irregular Forms.

We can easily imagine forms that would be difficult to file to shape on account of their length and irregularity of form. The method of procedure in such a case would be to make several master planing tools of short length, each having a section of the form to plane. Each tool should in this case overlap the portion that the adjacent tool planes by a small amount, serving as a gauge as in the cast of the symmetrical form discussed above.

Another method of gauging the depth of the cut may be added to the methods already mentioned. This method is that of measuring the distance from the top of the table or vise to the cutting edge of the tool by means of a jack or block. The position of one tool is taken after it has reached the depth and the depth of the next in order brought to the proper depth by gauging to the corresponding part of the form.

In the above the operations have been mentioned as planing operations. This has been to avoid confusion of terms, and what has been mentioned as to planing may be equally well said of milling. The tool spoken of as the planing tool then becoming a fly tool

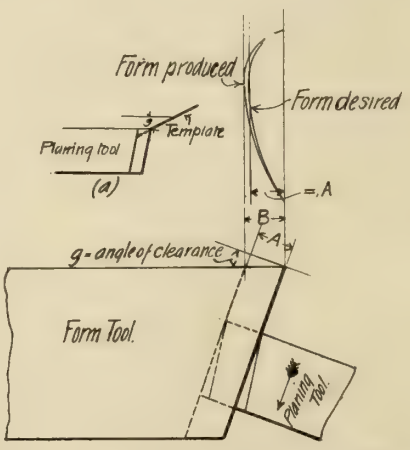

Fig. 6.—Error in Form Due to Clearance Angle.

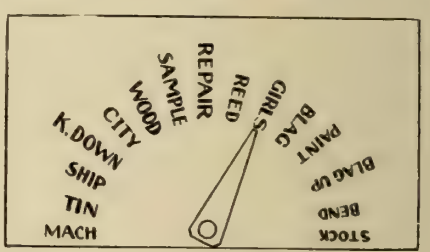
used in the holder, Fig. 5. The milling machine lends itself to this class of work on account of its easy handling and accurate movements, though as good work can be done on the shaper. Had the above operations been performed in the miller many toolmakers would lock the spindle of the machine against rotation and plane the form already milled by taking one or two very light chips, moving the table by hand. This removes any waviness that may be in the surface due to the holder running out of true or of springing. In this operation caution must be taken in having the fly tool set properly, at right angles with the table top, in order to preserve the form.

In laying out form tools it is a good idea to provide a gauge point from which measurements may be made. This is shown in Fig. 4 at (d), where the form tool is made to project past the formed edge or facing, off the side of the cutter for a distance of a quarter of an inch. The cutter is then faced across the side flush with this small strip and forms a means by which all cutters are made duplicates in relation to this side of the cutter. For setting the cutter in fluting taps measurement is taken from this side to the peripheny of the tap, parallel with the top of the table. This is a point that one is liable to overlook unless it has been impressed on one's mind by previous experience.

TRANSFER CARDS.

In the Gendron Mfg. Co., Toronto, the elevator man does most of the transferring from one flat to another. He devised a scheme to facilitate the quick transportation of material. When a truck is loaded in one department it is taken to the elevator. At the side of the elevator are hanging a number of tin plates, painted white, with the



Transfer Card.

names of the various departments printed on them. One of these plates is shown in the illustration.

A workman hangs one of these transfer cards on the truck turning the arrow to the name of the department to which it is to delivered. The elevator man looks at the card, hangs it on the nail so it may be used again and takes the truck to the proper department. This scheme is found to greatly facilitate the handling of loads of material and besides saves the time of the workmen.

James Alexander Young, well known in Montreal machinery trade, died suddenly at his residence in St. Urbain Street, Montreal. He was 51 years of age and a native of Montreal. Joining his father in the engineering and machinery business, he succeeded him as proprietor and manager.

Accurate Cost Keeping as an Aid in Manufacturing

Second Article of a Series on Cost Keeping, Describing the Time Keeping System in Use at the Works of the Canadian Locomotive Co., Kingston.

One of the duties of the timekeeper is to note and register the time each workman enters and leaves the shop. At the Canadian Locomotive Works the

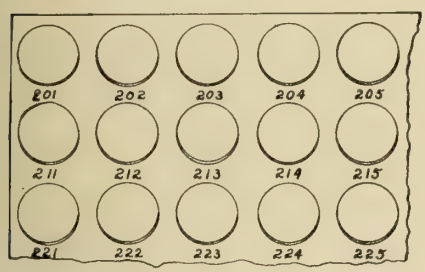


Fig. 1.—Check Board.

opening hour is seven and the closing hour is six, with one hour at noon. The working time is, therefore, ten hours.

The following method is followed for keeping the time of employes. Boards one inch in thickness and two feet long

Fig. 2.—Check.

by eighteen inches wide are prepared in the following manner: Holes of 1½-inch diameter are bored to the depth of ⅛-inch. About ¼-inch is left between the holes at the side and ¾-inch between the top of and the bottom of the next. At the bottom of the hole a slight cutting is taken out by means of a chisel. This

allows the check to be easily removed. Numbers are printed beneath the holes. The checks are made a little smaller than the holes and of brass, bearing corresponding numbers, and are inserted in the holes above their numbers. These check boards when not in use may be arranged in a cabinet. Before starting time the timekeeper arranges them on a long table in front of his wicket. If it is a small shop an ordinary table will serve the purpose. As the workmen enter in the morning or at noon each man is given a number which is his during his stay with the firm.

Recent Developments in Technical Education in Canada*

Conditions that Exist in some Shops and How They May Be Eliminated—Technical Education in Nova Scotia — Comments by F. H. Sexton, Director of Technical Education in Nova Scotia—Circulating Technical Libraries in Ontario.

Young mechanics find it difficult at first to master the reading of blue prints and as it is important that he should understand them he is sometimes met with the refusal of work. One day one young machinist in a shop received a reprimand from his foreman because he could not read a working drawing with sufficient skill to do his daily work properly. He enrolled in the mechanical drawing course in an evening drawing school, thinking this course would meet his deficiency. He found that the first two lessons were concerned with lettering plates, the next three with drawing straight and curved lines and the handling of instruments, and that the remainder of the term was spent on the projection of points, lines, surfaces and solids. During all this time he was receiving in his daily work the same reprimands, and was therefore debating in his own mind the value of the drawing course. It is undoubtedly true that the drawing course this teacher had outlined in the drawing school is a proper one for teaching mechanical drawing for those who are to be draftsmen, but the average apprentice machinist, as well as this young man, does not see the direct application of this instruction to his work. He enrolled in the drawing school for a definite purpose. To be sure it was a narrow one, but nevertheless it had economic value to him.

The principal of the St. Lawrence, Mass., Industrial School overcame this difficulty by establishing in that school a course in blue print reading and arithemetic for machinists. The first lesson begins with some elementary instruction in the reading of simple drawings ; to teach him in five lessons where to look for the dimensions denoting length, breadth, and thickness; to show him the principles of simple sectional drawings and have him comprehend the laying out of holes for drilling. Instead of leaving school at the fifth lesson with no instruction which appealed to him, the students have received enough in those five lessons to fit them to meet the needs of their foreman, and are anxious to continue and receive the more definite and thorough instruction in the theory of mechanical drawing so as to be able to make sketches of machines and parts by means of a ruler and compass. It is not the aim of this course to teach the students to make pretty picture drawings.

The instruction in the various branches of mathematics is adapted to meet the needs of the mill operative, the machinist and the steam engineer. The terms used in the class room savor of the shop and mill. All the students are classed according to their trade. Evening and day classes are held and subjects are arranged and taught to appeal to the different classes. Thus the application of mathematics for the engineer is different from that for members of other trades.

Technical Education in Nova Scotia.

The Department of Technical Education in Nova Scotia is under the direction of Frederick H. Sexton. He has instituted the system of evening technical schools. There has been constructed also the Nova Scotia Technical College at Halifax. One building contains the lecture rooms, assembly hall, scientific laboratories, Provincial Science Library, the Provincial Museum, and administration offices. The workshops, power and heating station, hydraulic laboratory, mining, and metallurgical laboratory and mechanical and electrical engineering laboratory will be in buildings of factory type, separate from the main college building.

Two-year courses consisting of general mathematics, science, language, drawing workshop, etc., will be carried out in Nova Scotia's four colleges and

* In March, 1908, appeared the G.T.R. Apprenticeship System ; November, 1908, Industrial Course at Fitchburg ; December, 1908, Urgent Necessity for Technical Education in Canada ; January, 1909, Co-operative Technical Education with Examples.

in Mount Allison University, N.B. The last two years will be taken at the Technical College. Short courses will be provided in mining for colliery managers, in civil engineering for road inspectors, in mechanical engineering for firemen and steam engineers, etc. These short courses are necessary, in order to serve the province with the educational needs that are so apparent in the industrial circles.

In establishing a system of technical education, the government in Nova Scotia realized that they had to provide for both the youths that were about to become wage-earners and also those who were already engaged in the industries. They therefore provided a system of evening schools.

In the large centers engineering schools are maintained, firemen engineers, and mechanics are instructed in the elementary scientific principles and modern practice in steam and mechanical engineering. Classes in mechanical drawing, machine drawing, electricity and dynamo-electric laboratory have been established in connection with the engineering schools, and have been very well patronized. To make the teaching in this subject effective, considerable electrical apparatus and a number of motors, dynamos, etc., were purchased and a laboratory started in each place so that the men may work with the actual machines, in addition to classroom work.

The coal mining schools aim to instruct miners in the science and art and modern practice in this difficult branch of industry. There is an evening school in practically every colliery town in Nova Scotia—some twenty in all. Day classes are held in the larger towns for men who work on night shift. The teachers, with the exception of a few assistants, are men who are best fitted by training and long practical experience to act as instructors.

Evening technical schools have been established in the various larger manufacturing centres. There are at present four of these, viz., Halifax, Amherst, New Glasgow, and Sydney. In each place they are conducted in the public school buildings. The Provincial Government bears practically all the expense of the coal mining and engineering schools, but in the evening technical schools provides one-half the cost of instruction and furnishes the necessary apparatus, while the locality is required to supply the other half of the cost of instruction, besides the rooms, heat, light and janitor attendance.

Courses are given to teach the men in different vocations the drawing, science and modern practice connected with those vocations. The courses in any locality depend on the number of students available and the dominant industries. There are some classes, such as Practical Mathematics, Mechanical Drawing, and Electricity, etc., that are demanded in every centre, and then there are others, such as Metallurgical, Chemistry, Pharmacy, etc., that are dependent on the size of the locality and the special industries.

The Need of a National System.

Mr. Sexton speaking at the Canadian Club in Toronto, said that the factory system was the outgrowth of modern thought, that it was a process of evolution. It had come to stay, and the best way was to adapt the school system to it. The modern factories want leaders, foremen in their work. Almost all manufacturers say that it is almost impossible to recruit foremen from the ranks. One very prominent manufacturer said that he would have to shut down his shop if his foreman "quit," as he had not a man in the place capable of taking his place. That was the difficulty with the differentiation taking place in trades.

These men were boys who left school at 14 years of age, ill-equipped for the great work before them. They could no longer learn all of a trade, but just one part of it, and all-round men, capable of taking any place were sadly lacking.

The German system was commenced about 40 years ago. Germany has meagre resources, but the leaders figured that the people were an asset and began developing the people, and did not pay so much attention to the resources of the country. In Canada there is danger of developing the resources only and letting the people go. In Germany all the children go to the same schools, the common schools, until 10 years of age. If they desire after that age to go into the professions, they go to a classical school, and so on. But there are trade schools for the boy who wishes to learn a trade—for the boys of the poor man who must earn their living. Here they attend for some time. Then there are what are termed part-time schools. If a boy is working at a trade in order to earn his living, he must attend these part-time schools, where he receives the same rate of wage as he does when engaged in the factory. Then there is an indefinite number of evening schools, and also on Sunday. These Sunday schools are opened with a religious service, and the boy is taught something useful. Munich alone had 40 trade schools, where 40 different trades were taught. The system, declared the speaker, had raised the thrift, the industrial education and the capacity of all German tradesmen above all others.

Developments in Ontario.

A departure along the lines of technical training and practical science for adult artisans has been decided upon by the Education Department. The initial steps have been arranged, and the necessary legislation for the carrying out of the project will be introduced by Hon. Dr. Pyne, Minister of Education, at the next legislative session.

A league of libraries in industrial centres will be formed. Each library will be required to expend not less than $100 per annum for the purpose of purchasing text-books covering the principal trades represented in the workshops and factories in the town. To such libraries the Education Department will loan, through travelling libraries, technological books to the value of $100. Care will be taken to prevent the duplication of books. The text-books will be loaned to any mechanic without charge, and it is expected that arrangements will be made for holding examinations in the local libraries at stated intervals. Mechanics who complete the course of reading and pass the examinations will be given certificates.

The examinations will probably be held under the control either of the Department of Education. Mr. T. W. H. Leavitt, Provincial Inspector of Public Libraries, has been in communication with several manufacturers and employers of skilled labor, and they are enthusiastic over the project.

Business Course for Engineers.

McGill University has added another course to its curriculum dealing with the business aspect of engineering.

Among the other subjects treated of will be the relation of engineering to business, money and credit as applied to engineering business, the operating and business organization of companies, the purchase and sale of engineering material, accounting and bookkeeping in engineering works; specifications; contracts and reports; estimates, valuations, etc. The course of lectures is to be given by Robert A. Ross, E.E., of Ross & Holgate, Montreal.

AN ARTIFICIAL GRINDSTONE.

A new method of grinding glass is used by the Onward Manufacturing Co., Berlin, Ont. This discovery is a grindstone made from one-half best portland cement and one-half silica sand, the ingredients being thoroughly mixed and tamped even. When properly made the stone has no hard and soft spots, and it will grind glass without scratching. The cost is about 10 per cent. of the common grindstone. The new stone has been used successfully for one year and found to be superior to natural stone.

PRACTICAL ARTICLES BY OUR READERS

POWER PRESS CLUTCH.

By J. H. R., Hamilton.

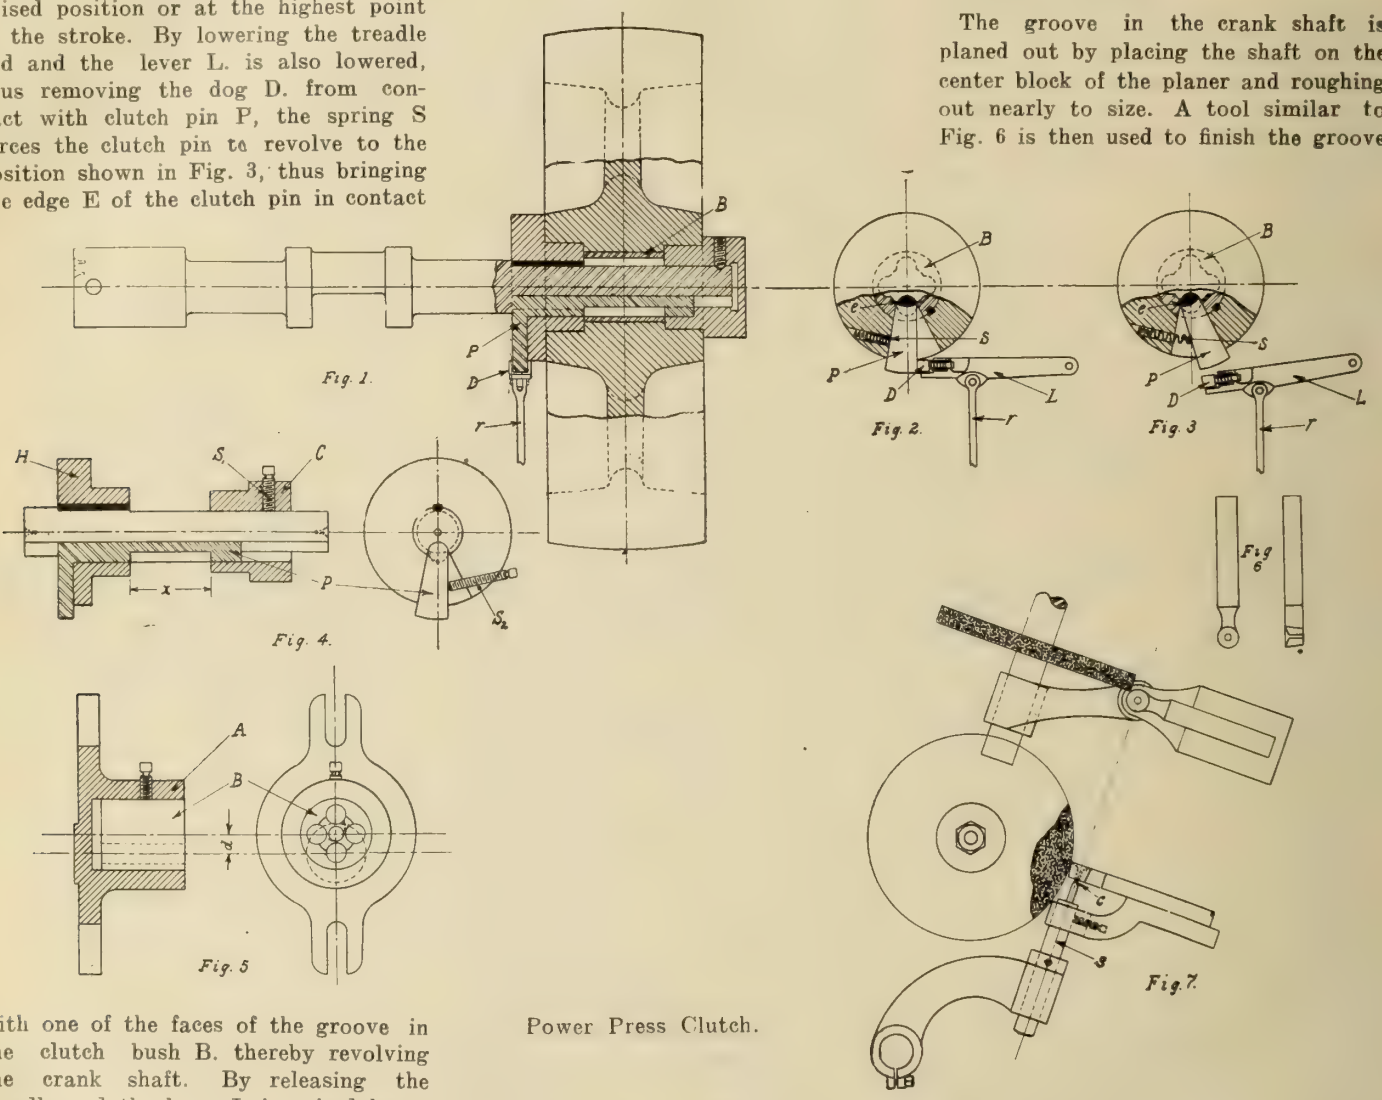
Fig. 1 shows the clutch assembled on the crank shaft with the fly-wheel in position.

Fig. 2 shows the position of the clutch pin P when the ram is in a raised position or at the highest point of the stroke. By lowering the treadle rod and the lever L. is also lowered, thus removing the dog D. from contact with clutch pin P, the spring S forces the clutch pin to revolve to the position shown in Fig. 3, thus bringing the edge E of the clutch pin in contact with one of the faces of the groove in the clutch bush B. thereby revolving the crank shaft. By releasing the treadle and the lever L is raised by a spring (not shown) causing the dog D to ride on the circumference of the hub H. until it comes in contact with clutch pin P forcing P. back to the position shown in Fig. 2, allowing the fly wheel to run free on the hub and cap which are fastened to the crank shaft as shown.

Fig. 4 shows a jig used in removing the centre portion of the clutch pin P. The mandrel is a short shaft, having the same diameter as the crank shaft, and the hub and cap are the same with the exception that the hole in the cap is bored clear through so as to work the mandrel between the lathe centres. The hub H. is keyed to the shaft and the cap C. is free to move along the mandrel for any variation in the space x and secured by the set-screw s. The pin is kept in position by the set screw through the hub and bearing on pin P. The part of the clutch pin shown shaded is then removed.

Fig. 5 shows the jig used to bore the holes in the cast steel clutch bush B. A. is a cast iron piece with a hole bored in it to receive the clutch bush B. The boss on the back is turned to fit a recess in the face plate, care being taken to have the center of boss the same distance from center of hole as the center of the clutch bush is from the centre of the clutch pin holes. The four holes are then bored and the bush placed in another chuck, the centre hole drilled. The remainder of the stock (shown shaded) is then removed by a large bit drill.

The groove in the crank shaft is planed out by placing the shaft on the center block of the planer and roughing out nearly to size. A tool similar to Fig. 6 is then used to finish the groove the diameter of cutting edge being a little less than the finished clutch pin. To bring the cutting edge of tool to something near a true circle the crude support shown in Fig. 7 was arranged on the emery jack. A small hole is drilled through the center of the tool and countersunk as shown this hole rests on the center c of shaft s. The support is then revolved and the cutting edge of tool brought to the required size.

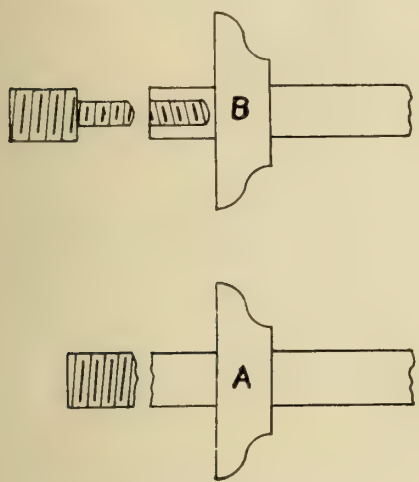


Power Press Clutch.

REPAIRING BROKEN SAW MANDRELS.

By Hugh A. Carmichael.

This may not be a strictly new idea, but it is one we now make use of very frequently in repairing mandrels when the eye pin is broken off, as shown at A in sketch. After centreing mandrel in lathe, using steady rest on end with collar on, we true off broken end, then run a drill into this end, about one and a half inches, using as large a drill as size of shaft will allow. This hole is then bored out true and a good



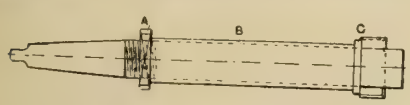
Repairing Broken Saw Mandrel.

thread chased in it, using same number of threads as was used on piece broken off which saves changing gears on lathe when this thread is cut. The mandrel is taken out of the lathe and a short piece of the right size steel shaft is centred up, one end of which is threaded to screw into the hole made in end of mandrel, as snugly as possible. After screwing this in, using a pipe wrench, the mandrel is again put in lathe and a thread chased on other end of piece inserted, to correspond with piece broken off, using same nut. This makes a first class job and is very easily done. B shows the repaired mandrel.

A FACING CUTTER BAR.

By B. K. Y.

The accompanying sketch shows a very handy form of cutter bar which elimin-



Facing Cutter Box.

ates the annoyance of broken screws and packing. It consists of the ordinary form of bar with a thread and nut A at the collet end, a loose sleeve B made of gaspipe, and a collar C. To fix the cutter simply tighten down nut A against the sleeve; this holds the cutter very firmly, and also ensures it being true against back and front faces.

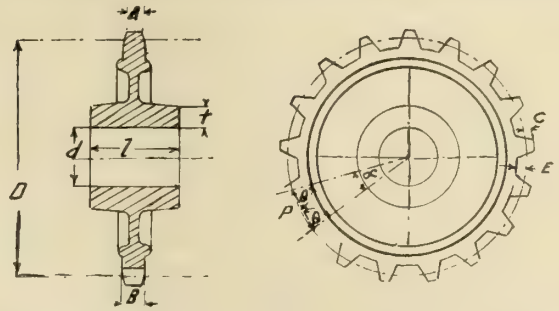
DIMENSIONS OF SPROCKET WHEELS.

By W. Laird Ketchen.

The accompanying line cut gives the rules for finding the dimensions of sprocket wheels and should be useful for mechanical men and draftsmen. Sprockets are coming into a great deal of use and mechanical handbooks contain very little data on the subject. Before I originated this rule, sprockets had to be laid out graphically.

To find the weight of castings, multiply the cubic inches by 0.27 for iron, 0.29 for steel and 0.30 for brass.

—DIMENSIONS of SPROCKET WHEELS—



No. of Chain	Pitch of Teeth P	A	B	C	E	Working strain in lbs	Effective Pull in lbs	Approximate speed feet per min.
25	·90625	3/16	5/16	3/16	3/16	75	45	1000
32	1·40625	5/16	7/16	1/4	1/4	150	90	1000

103	3·09375	13/16	1 3/16	7/16	11/16	1800	1080	300

All dimensions in inches

N = No. of teeth

D = Diar. of Wheel

d = diar. of shaft

P = Pitch of Teeth

t = thickness of metal in hub

l = length of hub

α = angle at apex, of triangle formed with pitch as base = center of circle as apex.

θ = angle at Base

$D = 2\left(\frac{P \times \sin\theta}{\sin\alpha}\right)$ $t = \frac{D}{96} + \frac{d}{8} + \frac{5}{8}$" (approx) (Box's rule modified)

$\alpha = \frac{360}{N}$ $\theta = \frac{180 - \alpha}{2}$ $l = 2d$

Example Sprocket wheel 30 teeth 75 chain bore 2½"

$\alpha = \frac{360^\circ}{30} = 12^\circ$ $\theta = \frac{180^\circ - 12^\circ}{2} = 84^\circ$

$D = 2\left(\frac{2{\cdot}625 \times \sin 84^\circ}{\sin 12^\circ}\right) = 2\left(\frac{2{\cdot}625 \times {\cdot}966}{{\cdot}2079}\right) = 25{\cdot}15$" diar. at pitch line

$t = \frac{25}{96} + \frac{5}{16} + \frac{5}{8} = 1\frac{3}{16}$" ∴ diar. of hub = 4 7/8"

SOME SHOP DEVICES.

By F. J. Deegan.

A shop where I worked made sketches from the blue print on common pad paper. When a job was finished the sketch was destroyed notwithstanding that this part was a regular part of the machine made over again. The feature of a card of this kind is that it

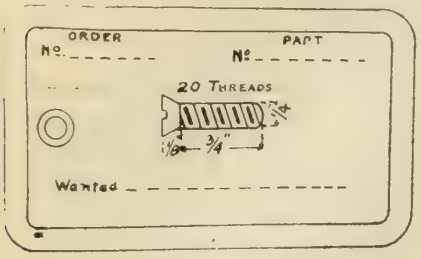

Fig. 1.—Tin Frame for Sketches.

will not be destroyed, having a tin frame of heavy cardboard and shellacked after the sketch made to prevent mistakes being made. It can be used for small interchangeable manufactured parts. A new sketch doesn't have to be made every time more of them are to be made.

Figure 2 is a small tool which should be in every man's kit. It is for loosening tight screws, especially those that can not be gotten out with the screw

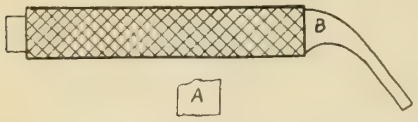

Fig. 2.—Small Tool for Loosening Tight Screws.

driver. With a tool like this a few taps with the hammer will loosen it or tighten it either if that is desired. A shows front view, B is the side view of tool.

Fig. 3 shows a method of making lathe centers. In my estimation is beneficial in more ways than one in saving in cost of construction and time. It consists of tapes with internal thread tapes and can be made of machinery steel, centre point of tool steel threaded or if you wish, instead of threaded parts, you would have them tapered, but it is my opinion that the thread is more durable.

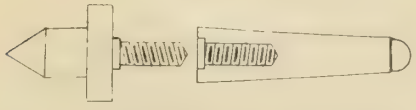

Fig. 3.—Making Lathe Centres.

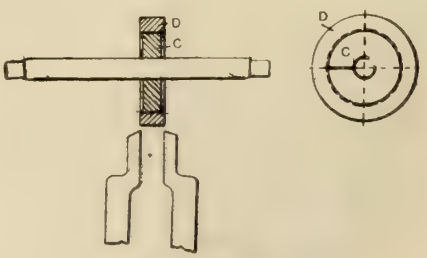
The feature in these centers is the saving of time. When joint is worn down you can readily insert a new point having a small quanity in stock and not take the time to turn a new taper. On large centers this ought to prove a saving. I think that it in no way impairs the accuracy of the center having a pin inserted or screw to hold it in place. Every center should be ground before using and after inserting this point it is not necessary to take it out until worn out.

FACING-UP NUTS.

The accompanying sketch shows a neat method of truing up nut faces after being made in the capstan lathe. This is an unsatisfactory job to do in a lathe chuck, as it does not ensure the faces being true with the thread or each other, all nuts will be the same thickness without any trouble.

besides needing two settings. Make an arbor with a few thousands of an inch taper, and a collar C bored to fit small end of the arbor, screwed on the circumference to fit the nuts, and split halfway through. Screw nut D on to C and



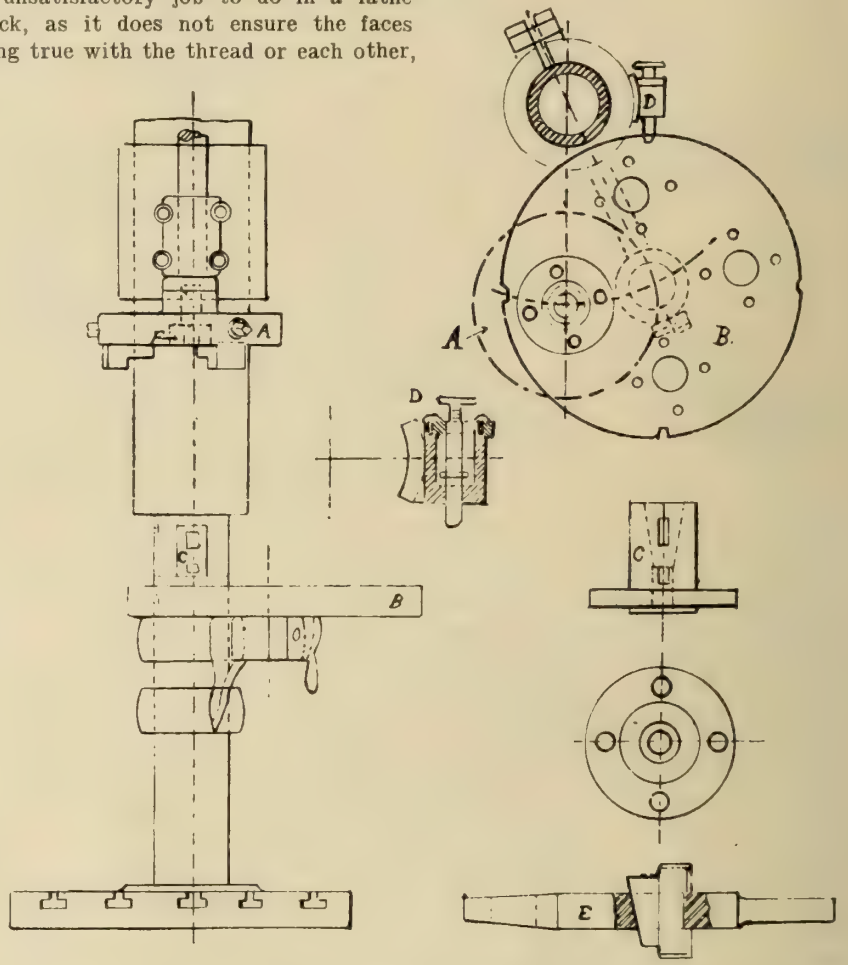
Facing Nuts.

drive both on to arbor. If two knife tools are set to cut the correct width, both sides can be finished at once, and

DRILL PRESS FOR TAPPING BORING AND FACING.

By Wm. J. Hurley.

While going through one of our machine shops here I saw quite a novel



Drill Press for Drilling, Tapping and Facing.

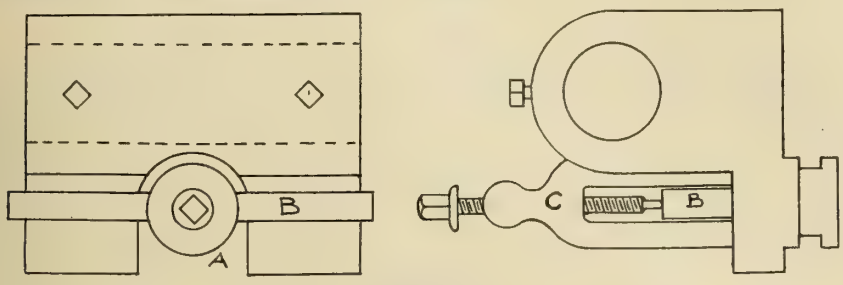
way of fitting up a drill press for tapping, boring and facing small pipe fittings and flanges. When doing them the old way it required a lot of time changing the different tools on the spindle of the machine.

A is a small powerful universal chuck. Fitted to the spindle B is the table, bored as shown, to receive four tool holders like C, these having taper holes in which the boring bars and drills are to fit. The table has four notches for latch D. After releasing the latch the table can be turned and any of the four tool holders can be brought perfectly central with the chuck A, the latch D holding the table in different positions.

BORING TOOL.

By J. Stevenson.

The boring tool shown on page 51 of the January issue Canadian Machinery can be improved, I think by making the holder as shown in the accompanying illustration. A represents a slot in



Boring Tool.

the casting large enough to clear the tool past C.

When in use a piece of steel or a tool B is put in the tool post so that the tool rest is clamped tightly to the carriage. This slight change makes the tool described in the January issue much easier to put in place. Besides it saves time bolting to the lath tool rest and may be very quickly removed when the operator requires to use an ordinary tool.

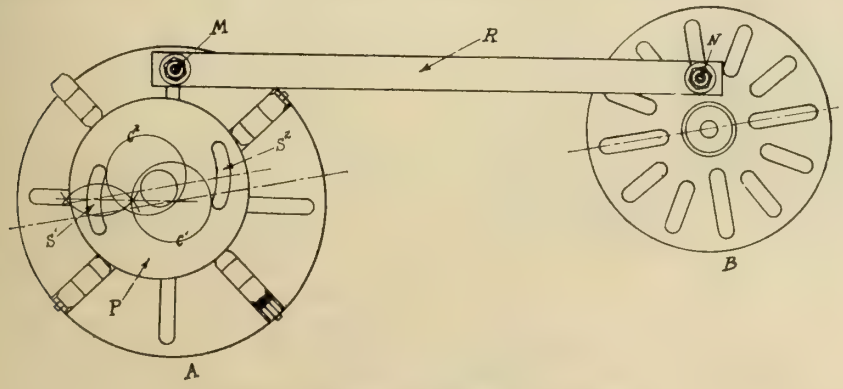
CUTTING ECCENTRIC SLOTS IN THE LATHE.

By J. H. R., Hamilton.

The sketch herewith shows an attachment arranged on two lathes for shaping out the two eccentric slots S-1, S-2, in the plate P.

The two circles C-1 and C-2 are scribed on the surface of the plate concentric with the slots S-1 and S-2 making it easier to set the plate true in the lathe.

A stud M. is secured in the slot of the chuck also a stud N, in the face-



Cutting Eccentric Slots in a Lathe.

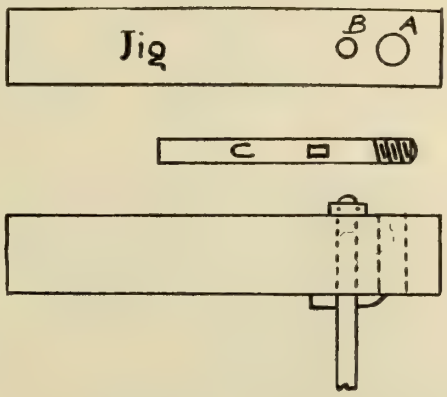
plate of the other lathe (placed so as to give the desired stroke where the tool is cutting the slot).

A rod R the proper length is put on the studs so that when power is applied to lathe B. the desired amount of stroke is transmitted to the chuck on lathe A.

A shaper would also answer the place of lathe B, but a man must be governed by the lay of the tools in the shop.

TOOL FOR DUPLICATE PARTS.

The bar, out of which the jig is made, is $\frac{7}{8}$x$\frac{1}{2}$-in. and 8 in. long. A is for stock and in the shop where this jig is used, one size used is $\frac{1}{2}$-in. B is $\frac{3}{8}$-in. diameter



Tool for Duplicate Parts.

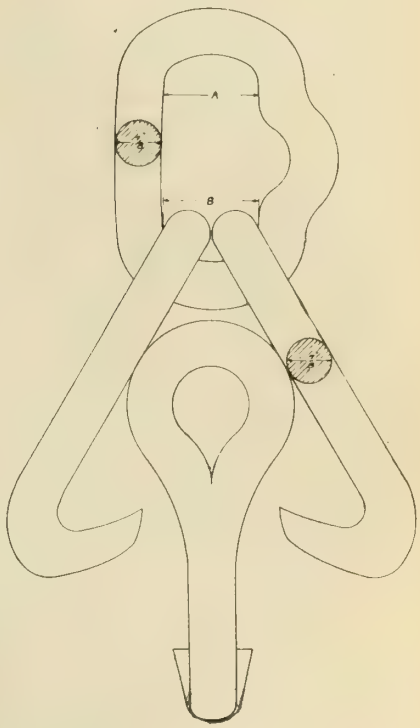
and holds the tool. The stock to be machined is $\frac{1}{2}$-in. cold rolled steel and $\frac{1}{8}$-in. full is to be removed. The length of cut is $3\frac{1}{2}$ in. and 30 are chucked and machined per hour.

The tool is gripped in the tool post and there is no centreing. The feed is 3 in. per minute and the spindle of the lathe runs at 525 revolutions per minute.

C is the tool holder and is $\frac{3}{4}$-in. square steel with a taper $\frac{3}{8}$-in. thread at one end. This slips through B and the cutting tool is drawn up against the jig by means of a nut. At A the jig is hardened and made smooth.

CASTINGS LIFTER.

The accompanying cut illustrates a very useful castings lifter. It is used by a Hamilton manufacturing company in three different forms. In the one



Castings Lifter.

shown the arms are in position for a small casting. For a wider casting the link is turned so that the arms are at A and B and the lifting hook catches in the curved iron. The material used in the construction is $\frac{7}{8}$ inch round.

Another link is 3 in. wide at A and 2 in. at B and is 8 in. long, with a short chain link connecting the arms to the large link. The lifting hook finds its own center in the link. This lifting arrangement will take in a very wide casting.

A third arrangement has a link with arms similar to the second. Instead of one chain link connecting the large link and arms, however, a chain 30 inches long is used. This is used for the handling of rough castings. The first two are the most used and cover the greater range of castings handled.

D. L. Jones has been appointed locomotive foreman, Melville, Sask., with charge of the motive power and car departments.

NEW EQUIPMENT *for* POWER PLANTS

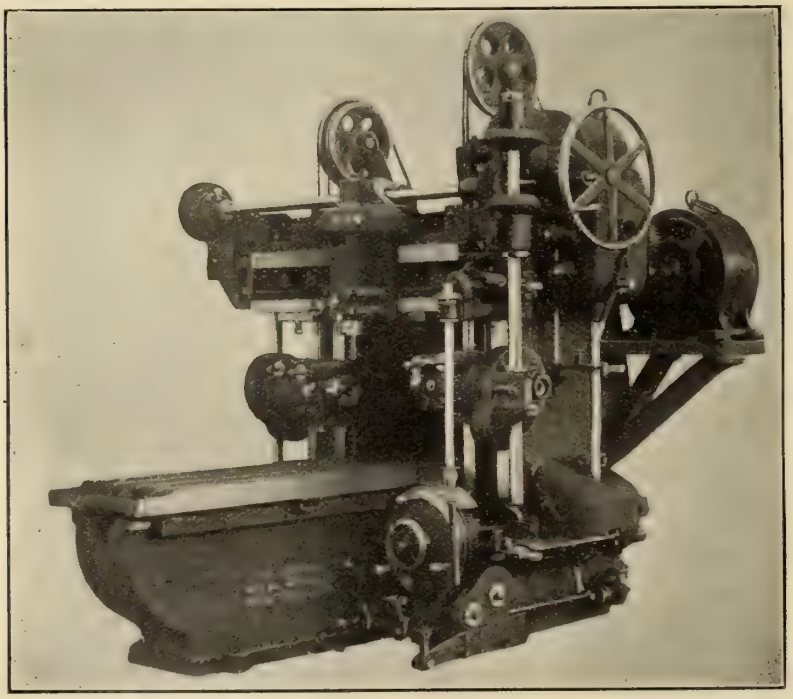
To Have a Place in this Department the Machine or Appliance Must Have New and Interesting Features — No Write-Ups Can be Used.

MOTOR DRIVEN THREE HEAD MILLING MACHINE.

The tool is made particularly for milling engine bases and transmission cases of automobiles. It is also adapted for any other work which may be machined on either a planer or milling machine. The three spindles have speeds varying from 15 to 120 R.P.M. The speeds are arranged for face mills up to 10 inches in diameter for steel or cast iron, but for aluminum work larger cutters may be used. The machine has a capacity of 26 inches between the ends of the horizontal spindles, and 24 inches between the table and vertical spindle.

The motor equipment consists of a 15 horse power, direct current, shunt wound, Westinghouse type S motor. The motor is mounted on a bracket in the rear of the machine, where it takes up little space and does not interfere with the work or the operator. The speed changes, from 875 to 1,500 R.P.M., are effected by variations in the shunt field by means of a Westinghouse drum type controller, not shown in cut. In addition to the range of speed thus obtained, there are four changes by mechanical means. This enables the cutting speed required by the work to be obtained with exactness and maintained with certainty. In the case of machine tools especially is it desirable to have perfect control and adjustment of the speed ; and undoubtedly the most satisfactory method of obtaining this is by means of the adjustable speed motor and a suitable controller.

The milling machine is made by the Ingersoll Milling Machine Co., Rockford, Ill.

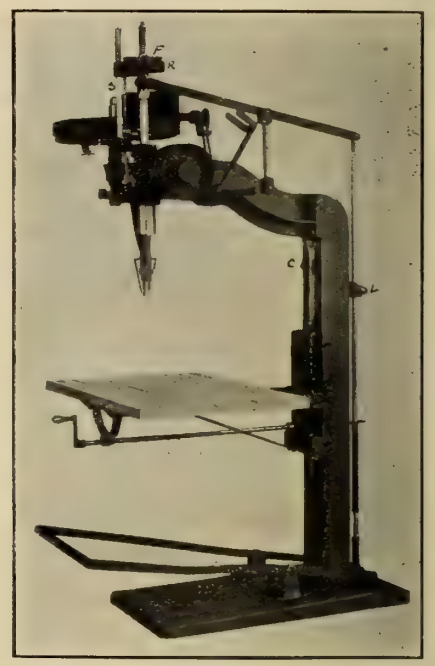


Motor-Driven Three-Head Milling Machine.

SCREW-DRIVING MACHINE.

The machine illustrated herewith is a large and improved screw driving machine. The machine is able to take in very large work as it sets screws to the centre of a 48-in. circle and table has sufficient vertical adjustment to take in work 30 in. high. The table is automatically raised to clamp the work together just as the screw is started by means of a cam C, operated by a lever L, extended through the column and connected to the vertical rod, which connects the foot treadle and spindle operating at the top of the machine. There is a spring support for the table, which yields if an anusual thick piece of work is being operated on. The treadle by which the machine is operated is bowed outward, so that the operator may stand in front or at the side, whichever is most convenient.

In addition to the usual features of magazine feed, adjustable friction drive to the spindle, etc., the machine has a positive stop for the spindle so that screws may be merely started or set so that the heads project to a uniform height if desired. This is accomplished by extending the driven friction flange F outwardly so as to extend over the driving flange and forming a male cone clutch surface on its periphery. A ring R concentric with the spindle and having a corresponding female cone surface is arranged to slide freely vertically on a rod S, being carried upward by the arm which operates the escapement cams and following the arm downward until arrested by the collar T, which is adjustable on the rod. The spindle continuing downward the clutch surfaces engage arresting the rotary motion of the bit, the friction flanges which drive the bit being at the same time slightly separate, preventing undue wear. This machine is built by the Reynolds Machine Co., Rock Island.

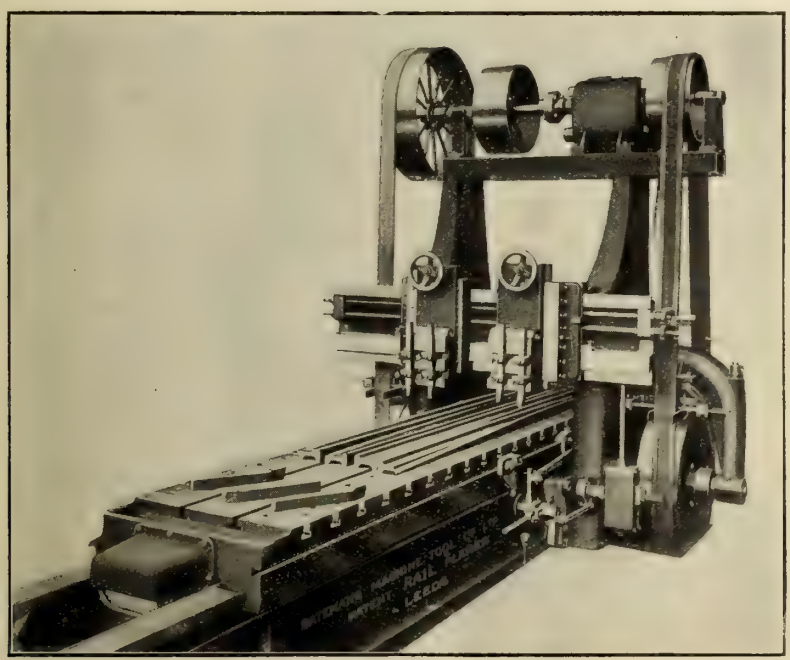


Screw Driving Machine.

BATEMAN TOP-SPEED RAIL PLANER.

The Bateman topspeed rail planer is a most massive tool, with great rigidity, so that when taking maximum cuts with the heaviest feed there is no chatter.

Four tools are employed simultaneously. They are held in two massive tool boxes, borne upon a crossrail some 20½ in. deep, and strengthened by an arched back. The support given to the crossrail by the housings is practically solid, for the latter have large, strong bases, and are securely tongued and bolted to the bed, which is itself solid to the ground. In the centre portion of the bed it is continued 13 in. below the level of the floor, making a total depth of 36 in. It is of a strong box section, the sides being stayed by numerous cross-



Bateman Top Speed Rail Planer.

bars, also of box form. The sliding ways for the table are "flats," provided with automatic lubricators. Tne table is deep and well ribbed, the rack being cut from a solid steel slab.

Any cutting speed between 18 and 60 feet per minute can be given, and the return speed is 110 feet. On the cut stroke there are 4,042 square inches of belt for each foot of table travel, and a cutting power of 1 in. in depth, 22 feeds per inch, with 4 tools cutting simultaneously in steel of 45 tons tensile strength is guaranteed.

The change speed gearbox, which gives three cutting speeds, can be fitted, and the machine is adaptable for driving either by belt or by electric motor.

The principal dimensions are as follows :

Width between housings, 40 ins.

Height under crossrail, generally 12 in.

Length of stroke, 10 in. longer than the normal ; made any length from 10 feet long, rising 2 feet at a time.

Length over all about 75 per cent. longer than the table.

Feed range, from 43 per 1 in. to 4¾ per 1 in.

Height of countershaft, 8 ft. 6 in.

Width overall, 9 ft. 4 in.

Width of table, 33 in.

Bull or rack wheel, 48 in. diameter, 7 teeth engaging simultaneously with the rack.

The effect of the patent flywheel drive on this machine is shown by the speed tests given in the following table, and taken from a 20 ft. rail planer, fitted with 3 speed gearbox.

The loss of efficiency includes losses due (a) to belt slip between countershaft to driving pulleys ; (b) to reversals ; and (c) to accellerations.

Speedometer Readings		Length of Stroke	Time of 10 Cycles of Cut and Return		T.M.C. or Theoretical Mean number of feet cut per minute	M.E.C. Mean Effective Cut or number of feet of work actually cut per minute	Efficiency
Cut Speed	Return Speed		Mins.	Secs.			
Feet per Minute	Feet per Minute						
38	110	9 ft. 6 in.	3	29	28.1	27.27	.9705
29	110	9 ft. 6 in.	4	23	22.5	21.62	.9631
22½	110	9 ft. 6 in.	5	10	18.95	18.387	.9703

These planers are manufactured by Bateman Machine Tool Co., Leeds, England.

UNIVERSAL MICROMETER AND SURFACE GAUGE.

The accompanying illustrations show the universal micrometer and surface gauge in various positions. Fig. 1 shows the bar of the micrometer held in the base clamp to be used as a bench instrument. In this position any measurement from 0 to 7 inches can be taken. The bar can be shifted endwise to any de-

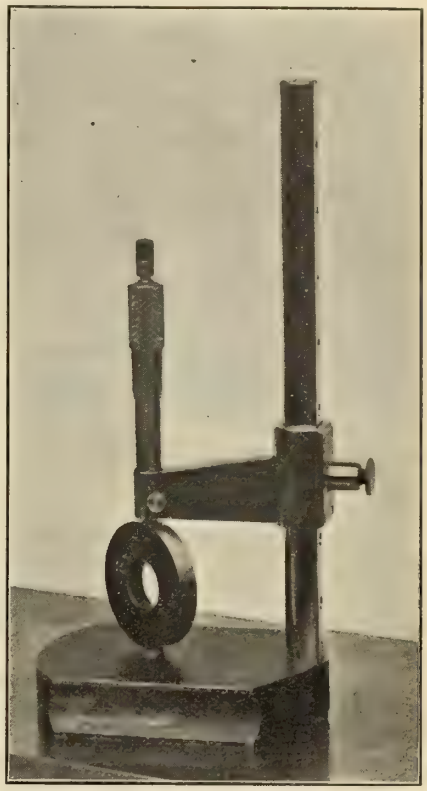


Fig. 1.—Used as a Bench Instrument.

sired position in the base clamp and by a quarter turn backward the instrument can be lifted out of the clamp and placed in position to permit the sliding head to be moved to the desired unit on the bar as indicated by the figures. As shown in Fig. 1, the instrument to be used in the hand will measure round work four inches in diameter and flat work to 7 inches by thousandths of inches. The bar is flattened on one side as shown and the inch positions are determined by conical holes in the centre of this flat. To set the measuring head to the required position on the bar, it is only necessary to slide the head to an approximate position as indicated by the figures and screw the locating pin down until its end seats itself in the hole in the bar. This operation positions the head accurately on the bar and clamps it rigidly at the same time. The

bar, as well as the locating pin and the bushing which guides it, are hardened, ground and lapped.

Fig. 2 shows the instrument with anvil head removed, and the bar micrometer head in position over the base anvil with a two-inch disc between the measuring surfaces. From 0 to 7 inches can be measured in this manner. The distance from the bottom of the base to

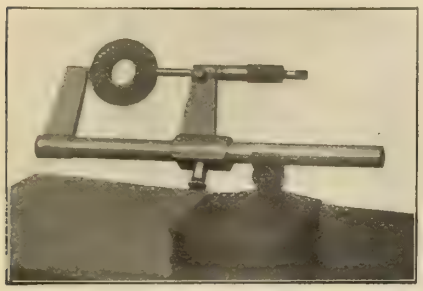

Fig. 2.—Measuring Two-inch Disc.

the anvil is one inch. With the head positioned to the second hole of the bar 0 to 1 inch can be measured. The bar is drawn to its seat in the base by the same screw used in connection with the anvil head.

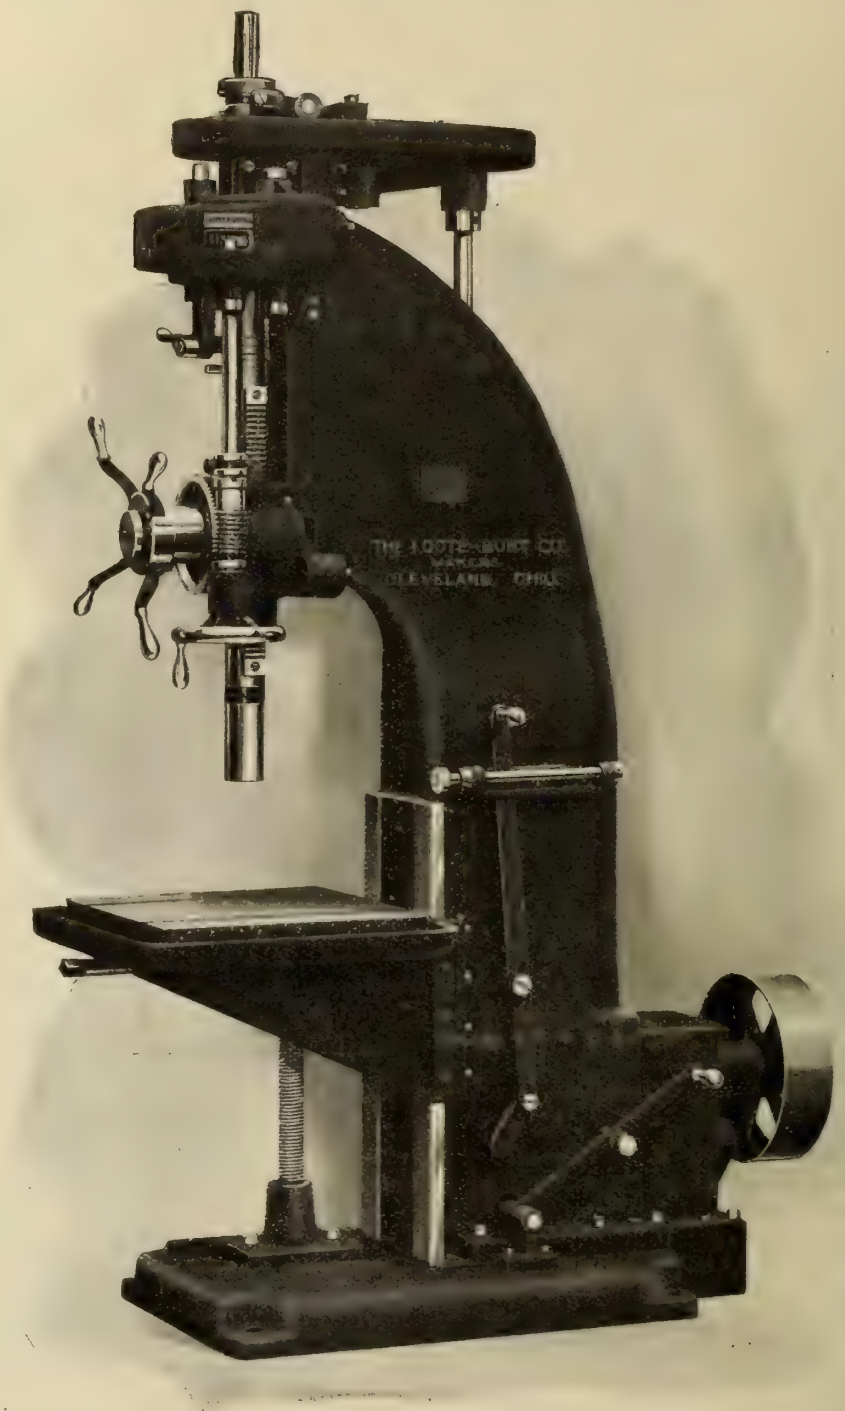
The micrometer can also be used as a scribing gauge and in other positions to suit the measurements to be taken.

This micrometer and surface gauge is manufactured by the Schellenbach-Hunt Tool Co., 14th and Plum Sts., Cincinnati, O.

FOOTE-BURT HIGH DUTY DRILL.

This machine has a capacity for high speed drills from ½ in. to 1¾ in. in solid steel to their full cutting edge capacity. The same is of the most rigid construction possible, with the highest grade material, for the different requirements used. All bearings are bronze bushed and are provided with liberal oil grooves. The machine is single belt driven with no shifting of belts required. All speed and feed changes are through a quick change gear device. Levers for stopping and starting machine, and for changing feeds and speeds are all conveniently located and within easy reach of the operator at all times. Spur gears are used throughout, except one pair of slow running two to one bevel gears at the driving end and one worm and worm gear for the feed.

The spindle is of forged high carbon steel, fitted with ball bearing thrust. Three changes of geared feed are provided; any one of which is instantly available by simply shifting a lever, conveniently located at front of machine. All feed changes can be made without the necessity of stopping the machine. Power feed is provided with adjustable automatic stop and hand stop. Hand feed is through worm and worm gearing, and quick traverse of spindle in either direction is accomplished through the spider hand wheel, located at front of machine, which, with either the in or out movement of



Foote-Burt High Duty Drill.

any or all of the handles, engages or dissengages the same.

The table is of the bracket knee type, having a large square lock bearing surface on the upright, to which it is securely gibbed. It is further supported and elevated by a square thread jack screw, located underneath, slightly back of the center of spindle, to permit boring bars or other tools passing through the table. It is also provided with liberal oil groove and two tee slots.

The drive is a self-contained unit, neatly located in base of machine. The nine spindle speeds are through a double train of gearing, which is always in mesh and runs in a bath of oil. This device consists of a lock disengaging any one of three gears in each of the two trains, giving the nine speeds, any of which is instantly available by shifting the levers, located at side of machine, to the different locations for different speeds, as indicated by index furnished. One pair of two to one bevel gears are securly housed at

the end of speed box, inside of column, which make the connection to the vertical driving shaft, and the distance between the vertical driving shaft gear and the spindle gear, being spanned by an idler spur gear, overcoming the necessity of but one pair of bevels in the construction of the entire machine.

The drill is manufacturing by the Foote-Burt Co., Cleveland.

THREE-CORNERED DRILL THAT BORES SQUARE HOLES.

A three-cornered drill that bores square holes and that can be used on any ordinary lathe drill press, or milling machine has been placed on the American market. The new machine bores a square hole nearly as rapidly as a round drill can bore a round hole. The same idea can be applied to drilling triangular holes and holes with five six or more sides, as desired. The device by which this is performed is simple in construction, consisting of a special drill, three-cornered in the case of square holes, and a special chuck for holding this tool, which is fixed on the ordinary lathe or drill press.

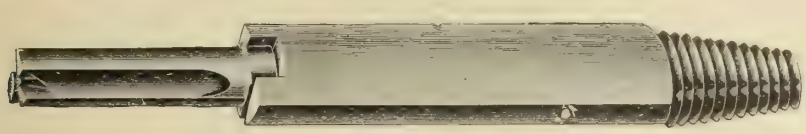


Fig. 1.—Three-Cornered Drill that Cuts Square Holes.

This chuck contains three parts that move independently of one another. First, a part which screws onto the spindle of the drill and revolves with the latter, second, a stationary part which rides upon the part first mentioned, and third, a holder into which the shank of the drill is screwed.

This holder is caused to rotate with part first mentioned, but is at liberty to move sideways a certain distance in any direction. Its exact motion is determined by a guide in the second part of the chuck, which surrounds the shank of the drill. The shank of the drill is three-cornered, but not exactly triangular, that is, the three sides are convex, being formed by arcs of circles struck from centres at the opposite corners. The three-cornered shank just fits into the square guide, and as the shank turns about in the guide, which is held stationary, the three corners of the shank in turn enter into each of the four corners of the guide. At the same time, the three corners of the cutting head strike out the sides of the work. The cutting edges are on the end of the tool, not on the side, being in this respect similar to the ordinary twist or flat drill. For drilling holes of different sizes only one chuck is required, the guide in the chuck being so constructed that the opening can be enlarged and diminished by turning the key.

The motion of the three-cornered shank of the tool within the square plate can be better understood when it is remembered the radius used to strike out the three sides of the shank is just equal to one of the sides of the square formed by the guide. Therefore if one side of the shank is rolling or sliding on one side of the guide, the opposite corner of the shank will be moving in a straight line corresponding to the opposite side of the guide; i.e., during a certain part of the revolution, the corners of the tool travel in straight lines, along the outside of the square. By trying this out with a small model it will be found however, that there is a small space in each corner where the rolling motion ceases, so that the corner is blunt and not sharp.

While blunt cornered holes are satisfactory for the great majority of uses, there are cases where a sharp cornered hole is desired, and this is secured by a special construction in which the tool is made smaller than the shank and one of the corners of the shank is rounded. The exact shape of the shank in this case has been determined by a careful cut-and-try method, and as templets have been made for each size, any number of tools can be duplicated in the right shape and size for each size of the hole to be bored.

For the introduction of the device in America, a concern has been organized under the name of the Radical Angular Drill Co., which has established offices and has a machine on exhibition at 114 Liberty St., New York City. At this place a milling machine has been fitted up with one of the chucks, which, however is of such a type that it could be applied to a drill or lathe with equal facility. Where the chuck is to be used on a machine regularly and continuously it is possible to simplify the construction somewhat by making the stationary part of the chuck a permanent part of the machine.

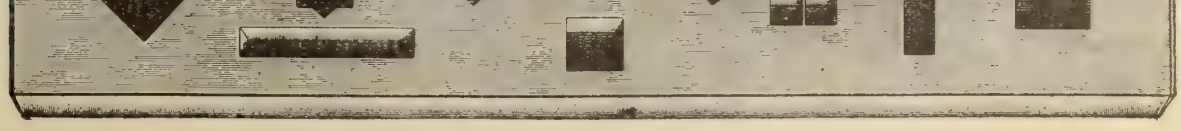

Fig. 2.—Holes Cut by Three-Cornered Drill.

SHORT SOCKETS AND SLEEVES.

Every user of taper shank drills has had a number of them put out of commission on account of broken or distorted tangs, caused principally by worn or poorly fitting sockets. Such drills are in most cases consigned to the scrap pile which is necessarily a very expensive practice.

The meet the growing demand for a device to utilize such drills, The Standard Tool Co. are making the "Economy Short Sockets and Sleeves."

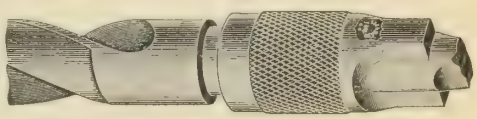

Fig. 1.—Economy Tang Gauge.

To provide a new tang to fit these sockets, the Economy Tang Gauge is used. By slipping it over the shank of the broken drill as shown in Fig. 1, a new tang can be marked of the correct size and position, which is then shaped either by milling, planing, filing or grinding. The new tang is heavier and stronger than the old one.

The shanks of the Economy Sockets and Sleeves are made of regular dimensions and will fit the spindles of all the leading makes of power drill presses. They are manufactured by The Standard Tool Co., Cleveland.

POWER GENERATION AND APPLICATION

Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

WELDING BY OXYGEN WITH HYDROGEN OR ACETYLENE.

By Emil Stern.

The atmosphere which surrounds us contains 76 per cent. of nitrogen and 24 per cent. of oxygen. In any ordinary flame the oxygen is used as a necessary accessory, while the nitrogen has to be carried through the process of combustion as a useless burden tending in every case to reduce the heat of the flame. So it is obvious that wherever a hot flame is required the use of pure oxygen will be of great advantage, supposing the increase of heat justifies the extra cost of buying or making pure oxygen.

For welding the application of pure oxygen as used within the last few years, has been a remarkable success, especially when used in connection with hydrogen or acetylene.

When using compressed gases it is necessary to use reducing valves to reduce the pressure to from 7 to 30 lbs. per square inch, at which pressure the gases are conveyed to the burners by rubber tubing, where they are thoroughly mixed. The gases enter the burner at a sharp angle, entering first a small mixing chamber. On account of the high pressure the excess of hydrogen and a small nozzle being used to increase the speed of the gases, the flame will not fire back. The mixture 4:1 generates a temperature of 3400 degrees F. (1900 centigrade), which will melt any metal. Sheet iron may be welded by hydrogen in sizes up to 3/8-inch. For thicker sheets the cost does not permit of using this process economically. On the other hand, very thin sheets require great care and skill as they melt and get holes very rapidly. A clever welder can weld sheets as thin as 1-132-inch.

The temperature of the flame depends largely on the quality of the oxygen. Commercial oxygen, as a rule, does not contain more than 96 per cent. of pure oxygen, the balance being nitrogen. The purer the oxygen the higher the flame temperature; the more nitrogen mixed with the oxygen, the lower the temperature. It might be possible by purposely diluting the oxygen to obtain a temperature which permits of welding safely very thin sheets. This would be important for many industries, for instance, in the manufacture of graniteware.

Since last year a new system has been applied for welding, which uses a mixture of acetylene and oxygen. Ten years ago trials were made to use acetylene for obtaining high temperatures. The results were not favorable, because the burners used did not fill the requirements caused by the inflammability and high contents of carbon in the acetylene.

Great Heat of Acetylene-Oxygen.

1 cubic foot of acetylene gas contains 1,550 B.t.u.

1 cubic foot of hydrogen gas contains 342 B.t.u.

1 cubic foot of acetylene-oxygen mixture contains 575 B.t.u.

1 cubic foot of hydrogen-oxygen mixture contains 274 B.t.u.

The calculated flame temperature of the acetylene-oxygen flame is 7,800 degrees F. The actual flame temperature is far below this point, probably around 5,500 degrees F.

The little blue acetylene-oxygen flame will melt anything, iron, carbido, brick and fireclay, graphite only will not melt. The high temperature of the acetylene-oxygen flame permits of welding large pieces, little heat being radiated until the welding temperature is reached.

A hydrogen welding seam looks distinctly different from an acetylene welding seam, the hydrogen tempering strip being about 2 inches wide, the acetylene tempering strip being less than 1 inch wide. This accounts partly for the cheapness of the acetylene process compared to the hydrogen process.

The price of welding per foot depends on the size of the material and the skill of the welder.

Manufacturers interested in the sale of the welding apparatus estimate the cost of welding 1 foot as in the accompanying table:

Cost of welding 1 foot of sheet iron.

Thickness of sheet.	Hydrogen welding. Cost of hydrogen and oxygen f.o.b. Toronto.	Hydrogen welding. Welders' wages at 40c. an hour.	Hydrogen welding. Total.	Acetylene welding. Cost of acetylene and oxygen f.o.b. Toronto.	Acetylene welding. Welders' wages at 40c. an hour.	Acetylene welding. Total.	Total, including capital charges for instalation.
Inch.	c.	c.	c.	c.	c.	c.	c.
1-64	.5	.1	1.5	...	...	...	...
1-32	1	1.2	2.2	.3	1	1.3	1.5
1-16	2	2	4	.8	1.5	2.3	2.5
1-8	7	3.5	10.5	2.5	2.2	4.7	5.2
3-16	16	5	21	5	3	8	9
1-4	30	6	36	10	4	14	16
3-8	50	8	58	20	5	25	28

These figures are much too low for practical use, especially when used outside the shop the cost may safely be figured to be three times as high. For safe calculation, not only material and wages, but interest and depreciation must be figured as well.

The hydrogen instalation is the cheaper one, its price being about $100. Acetylene plants are about $200—up to 3-16 inch, about $300—up to 1/4 inch.

Large plants up to 1¼ inches capacity with 5 Fouche burners, cost about $1,000.

The stability of the welding seam is of special importance. Evidently it depends largely on the quality of the hydrogen or acetylene. Above all, the gases have to be free from arsen and phosphor which two elements are known to make iron brittle. The skill of the welder is another important item. The material which is melted in the welding, also affects the stability. Consequently the stability of the welding does not entirely depend on the stability of the iron to be welded. Various tests have been made. Tough sheet iron—Swedish charcoal iron—gave the best results. The welding seam was in every case stronger than the original piece, which would always tear before the seam would tear.

Steel wire did not weld satisfactorily at all; the welding seam was brittle, the stability only amounting to 75 per cent. of the original piece. Practice shows that the stability is not reduced if skill and care is used.

It depends on the purpose for which it is used whether hydrogen or acetylene welding plant should be installed. The hydrogen plant is preferable for occasional use, for thin sheets, for repairing and for metals that melt easily. The apparatus is simpler, easier to operate and easier to move, there is less danger and the success is safer than with the acetylene plant. On the other hand acetylene permits of welding heavier pieces, and it will be cheaper in the end when in steady use, though the first cost is much higher. It is not so suitable for repair work and for moving. In a large shop long pipes will be required. No license is required for the instalation. The acetylene plant is especially suited for welding cast iron. In one instance the flange of an automobile cylinder was broken and repaired under guarantee for $35. A new cylinder would have cost $150.

The Manufacture of Chains for Driving Purposes

The Origin and Growth of the Hans Renold Company, Manchester, England —The Principal Types of Chain Made—A Description of the New Works.

Thirty years ago in a small rented room in Manchester, Hans Renold, assisted by only a man and a boy, commenced making chains for use in the textile industry. The original patent for bush roller chains was granted Hans Renold in 1880. The first chain to be used for driving a bicycle was supplied in December, 1879, to James Starley the first maker of chain driven bicycles. The work of these three formed the nucleus of the extensive chain-making business of the Hans Renold Company, and from the small room occupied in 1879 the works have grown continuously until the firm has now two large factories, having 320,640 square feet of floor space (over seven acres) wherein more than 700 hands are employed. The company has confined itself to the manufacture only of chains, sprockets and sprocket cutters.

The business grew with the development of the bicycle trade and other and larger types of chain, suitable for running at higher speeds were developed until now the yearly output amounts to chains capable of transmitting over 30,000 h.p. for what may be called real engineering purposes, as distinct from the driving of automobiles and bicycles, which amounts to even a greater quantity.

The rapid growth of this industry to such proportions makes it obvious that chain driving must possess many advantages.

Of course, chain driving has its limitations but good work can be obtained from a chain driven machine. The life of a chain offsets the increased initial cost. In cases where oil, heat, moisture, etc., are met with, a chain drive is exceedingly adaptable while in cases, where the drives are too short for belts and too long for gears, the chain is often the only choice. Where shocks are likely to be encountered and the slip of the belt would prevent them being transmitted through the machinery, in a chain drive they are absorbed by a spring sprocket wheel.

Fig. 1.—Block Chain.

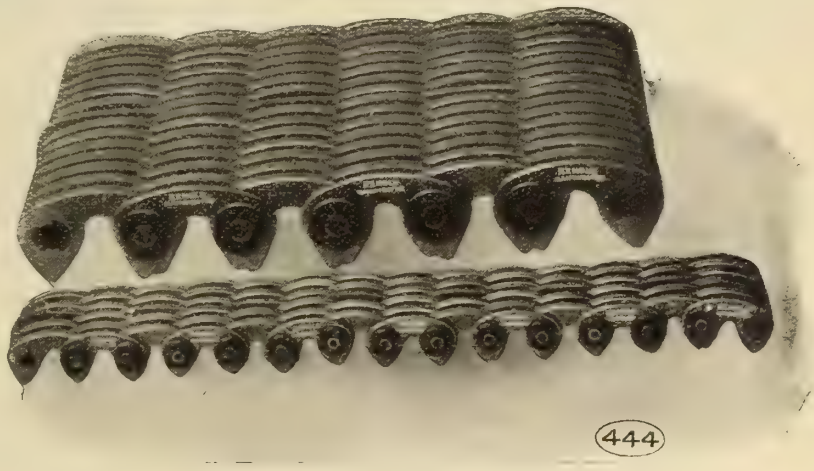

Fig. 3.—Silent Chain.

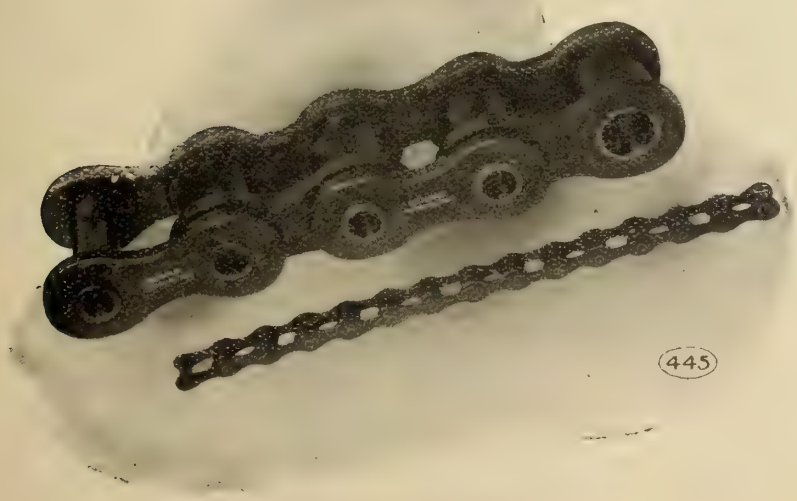

Fig. 2.—Roller Chain.

The Renold Company make three principal types of chains. The block chain shown in the illustration is made with either flat or curved blocks in pitches from 1 in. up to 3 in., rising by quarter inches. This type may be run up to 500 ft. per minute and the larger sizes are well adapted to conveyor and elevator work. The smaller sizes are used for feed drives on machine tools and in other similar cases. The second type is the roller chain. This chain has the

rivets surrounded by a steel bush on which is a roller on which the sprocket teeth act. Roller chains may be run up to 900 ft. per minute and are used to a large extent for automobile and bicycle drives.

The third type is rather a distinct departure from what one generally

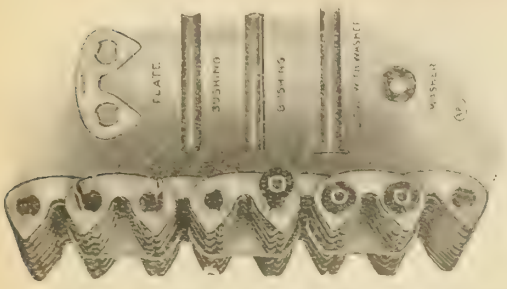

Fig. 1.—Silent Chain Showing Parts.

looks for in a chain. This is the silent chain and is like a flexible internal gear. In the modern form of this chain segmental bushes are fixed in the holes of each row of links and bear on hardened pins, the hole in the alternate links being recessed to clear them. This allows of a continuous film of oil between the bearing surfaces, which are doubled by the device. In cases where the driving power is jerky or the load liable to sudden fluctuations a spring drive is used. To obtain this, one of the sprockets is made in two parts. One of these, the inner plate, is keyed to the shaft and the other, the toothed rim, receives the torque through the springs, shown in the illustration, which are always in compression.

The silent chains can be run up to 1250 ft. per minute and even faster if special oiling devices are used. They are made in eight pitches, from ½ in. to 2 in. and up to 10 in. width. As much as 500 h. p. can be transmitted by this type and larger sizes are being developed.

The new works of the company are situated in a suburb of Manchester. The building is of one storey under a saw toothed roof and covers 210,000 square feet. This whole area is open with the exception of the different offices, etc. The roofs over the various aisles which separate the various departments are of the center ridge type with glass on both sides. Ordinary plank flooring is used except in the aisles, these are laid with rough asphalt. Every bay is exactly similar and this fact is of great convenience for the shafting. Every line shaft is the same length and runs in bearings at 10 ft. centers. These are suspended from pairs of transverse steel joists, and by loosening the hanger bolts which pass up between the joists any shaft may be slid to any extent across the bay or easily removed altogether. Chain drives, with few exceptions, are used throughout, the only exceptions being with the lighter automatic machines.

The use of chain drives to such an extent raises the question as to whether the practice is economical or the result of the enthusiasm of a firm whose business is the manufacture of chains. To support the use, tests have been repeatedly made and it has been shown that a saving is effected of over 20 per cent. in the power bill while the output is increased from 15 to 25 per cent. The work is done better and the tools last longer. The whole of the line shafting in the works is 3 in. in diameter and every line shaft hanger interchangeable. The counter shafts are 1½ in. and 2 in. in diameter.

Power is taken from the Manchester system and the only boilers in the works are for heating purposes. Three phase mains carrying 6,500 volts are brought to a substation at the works and the current shipped down to 400 volts for lighting and power. The machines are grouped and run by their own motors which are all 12 h. p. at 735 r.p.m. and are all interchangeable. Each motor drives its own line shaft by means of a silent chain. The initial cost is, of course, larger but this is offset by results. The amount of over head driving will be obvious from the illustrations and although this company has used chains for this purpose for over ten years no breakages have occurred. The attention needed is small and consists of a slight weekly application of oil put on with a brush. In the March issues of Canadian Machinery will be given the uses of chain driving for machine tools, etc., and in the April issue descriptions of the applications of this system in Canada.

Fig. 6. -Spring Wheel Partly Assembled.

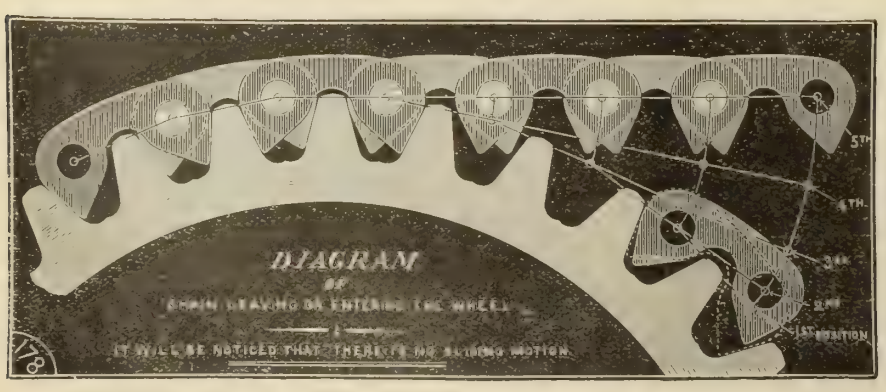

Fig. 5.—Showing Motion of Silent Cha in on Sprocket.

The man who can make an injector is a better workman than many a man who boasts that he made himself.

You may have a special talent, but it won't do you any good unless you know how to use it. You can't flag a train with a lantern that isn't lit.

It isn't the man who makes the biggest splurge who always gets there first. The Imperial Limited attracts lots of attention, but it can't outrun the telegraph.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. V. FEBRUARY, 1909 No. 2

A CENTRAL TOOLROOM.

"A place for everything and everything in its place." These were the words of a sign hanging in a certain machine shop. The foreman was a believer in system and made the sixty or more employees in the machine department live up to it. This was accomplished in the case of tools by a central tool room. When a workman wanted a certain tool, a check with his number on it was hung in the place for the tool, and the workman became responsible for it until it was returned.

This foreman found that this system prevented unnecessary duplication of tools, thus saving a large outlay. It also saves workmen's time hunting for tools. With this system he knows exactly where to find any tool he may require. Either it is in the toolroom or it is being used by a workman whose check is hanging in the place provided for it. If it were computed in dollars and cents the amount of time consumed by workmen in hunting for tools where there is no central toolroom it would be found that a great saving in general expense may be made by a little system.

Another point is to have the toolroom in a central place, thus eliminating unnecessary steps on the part of the workmen. A saving will thus be made. It will not show on the books, but it is one of those invisible economies that shows in the general expense. It removes one of the leaks that consumes workmen's time for which the employer gets no return. By a little time and thought the invisible losses may be eliminated.

GOOD OUTLOOK FOR 1909.

Expressions of opinion as to the trade prospects for the year are all marked with the utmost confidence in the future. There are no signs of doubt as to the trend of business; no lukewarm assertions that trade may be good if such and such a thing permits. But the positive declaration that trade will be good—a declaration based not upon mere optimism itself but upon tangible indications that are apparent to every business man who has bestowed thought upon the situation. And over and above all, each manufacturer is resolved to make his assertion good by exacting the largest share he can of the prosperity that he knows is within his reach. Thus we shall have wheels within wheels quickening upon each other, and all contributing to the great volume of business that will characterize the trading of 1909.

There is no reason to doubt the future. In the first place, the year starts under much better conditions than did 1908. There have been many months of steady building up. Concerns which were severely shaken by the depression, because they had developed beyond their strength, are now back upon a firm basis. The magnificent harvest has enabled farmers to liquidate those heavy obligations that they had in cases incurred through land speculation and too great an eagerness to get rich quickly, while all of us have learned the lesson of moving progressively but steadily.

The whole country breathes vitality and strength. There is the consuming economy of a year to be added to the natural development of a country that is going ahead by leaps and bounds. Capital poured into the country last year and it will do so again this year, while railway construction will be developed more vigorously than ever. Thus, from the Atlantic to the Pacific will there assuredly be a greater development of trade. The constituents are here, the power is here, the energy is here. It must come, and it will come.

TECHNICAL EDUCATION.

The address of Frederick H. Sexton, Director of the Department of Technical Education in Nova Scotia, before the Canadian Clubs in Toronto, Hamilton and London, should awaken such an interest in this subject that will result in technical schools being established in every industrial centre of Canada. Technical education is one of Canada's great problems. Nova Scotia has undertaken the establishment of technical educational courses in a manner that rebounds with credit to that Province.

In Ontario the Provincial Government is assisting the public libraries by loaning books of special interest to mechanics. The work being done in Toronto was described in the December, 1908, issue of Canadian Machinery. In Hamilton a technical school which will be fully equipped for demonstration purposes is being erected. It is also proposed that the Provincial Government erect a technical college in Hamilton.

Director Sexton, of Nova Scotia, pointed out the urgent necessity of a national system of technical education. During the past few months courses used in various technical schools have been described in Canadian Machinery; co-operative education and apprenticeship systems. We have had in view the enlisting of every one interested in the campaign for the education of the mechanic. The Dominion Government assists agriculture under the heading of commerce. Why not aid Canadian industry by the establishing of schools such as those of Germany and Massachusetts.

Technical education in Germany has given her preeminence even though she lacks the natural resources to be found in Canada. We have the chance to build a great industrial nation. Let us choose what has proven good to these two countries and adapt them to ourselves. In this way will be strengthened our position in the manufacturing world.

SOCIETY OFFICERS.

Canadian Railway Club, Montreal.

President, L. R. Johnson; treasurer, S. S. Underwood; secretary, James Powell, Box 7, St. Lambert, near Montreal. Meetings at Windsor Hotel, 1st Tuesday of each month, except June, July and August.

Central Railway and Engineering Club, Toronto.

President, C. A. Jefferis; Sec-Treasurer, C. L. Worth; Room 409, Union Station. Meetings at Rossin House, 3rd Tuesday of each month, except June, July and August.

Canadian Society of Civil Engineers.

Rooms at 413 Dorchester Street West, Montreal. President, J. Galbraith; secretary, Prof. C. H. McLeod. Meetings will be held at Society Rooms each Thursday until May 1st, 1909.

Nova Scotia Society of Engineers, Halifax.

President, J. H. Winfield; secretary, S. Fenn, Bedford Row, Halifax, N.S.

Quebec Branch of the Canadian Society of Civil Engineers.

Chairman, E. A. Hoare; secretary, P. E. Parent, P.O. Box 115, Quebec. Meetings held twice a month at Room 40, City Hall.

Toronto Branch of the Canadian Society of Civil Engineers.

96 King Street West, Toronto. Chairman, C. H. Mitchell; secretary, T. C. Irving, Jr., Traders Bank Building.

Manitoba Branch of the Canadian Society of Civil Engineers.

Chairman, H. N. Ruttan; secretary, E. Brydone Jack. Meets first and third Friday of each month, October to April, in University of Manitoba.

Engineers' Club of Toronto.

96 King Street West, President, A. B. Barry; secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

Canadian Electrical Association.

President, N. W. Ryerson, Niagara Falls; secretary, T. S. Young, Canadian Electrical News, Toronto.

Canadian Society of Stationary Engineers.

President, Charles Kelley, Chatham; secretary W. A. Crockett, Mount Hamilton.

Toronto Branch A.I.E.E.

Secretary, W. H. Eisenbeis, 1207 Traders Bank Building.

Universal Craftsmen Council of Engineers. Canada Council.

Chief, Chas. Mosley, 7 Charles St., W.; Secretary, H. E. Terry, 157 Bay St. Meets s cond Tuesday in each month in Room 2, 4th Floor, Temple Building.

Toronto Branch C.A.S.E.

Meetings 1st and 3rd Fridays each month at Forum Hall, corner Gerrard and Yonge Streets. Pres., F. Stubbs; Secy., W. C. Tait.

CANADIAN CLAY PRODUCTS' MANUFACTURERS.

The Canadian Clay Products Manufacturers held their seventh annual banquet in Brantford, Ont., Jan. 12, 13 and 14.

After registration on Thesday, Jan. 12th, the members were accorded a welcome to the city by Mayor Wood and ex-Mayor C. H. Waterous. A discussion upon Tile Making, led by Henry Janes, Delaware, Ont., closed the proceedings for the first day.

Wednesday, Jan. 13th was devoted to visiting some of Brantford's leading industries. Mr. C. H. Waterous conducted the visitors through the different departments of the Waterous factory and afforded them an opportunity of seeing the leading lines in the actual course of manufacture. A tour of inspection was then made of the Allen Red Brick Works, whose output last season was 1,265,000; the James Workman White Brickyard, and the Brantford Red Brick Company's yard.

An address was delivered in the afternoon by President J. S. McCannell. He spoke on Standardization of the size of brick and technical education. The annual banquet was held in the evening at which the subject of technical education was further discussed.

The next annual convention will be held in Chatham in January, 1910.

CANADIAN RAILWAY CLUB.

The regular monthly meeting of the club, Montreal, was held in the lecture room of the Canadian Society of Civil Engineers on Tuesday, January 5th. The main feature of the evening was Prof. Bancroft's talk on the topography of Western Canada. From a railway man's point of view it was interesting due to the fact that Prof. Bancroft clearly showed how the railways were taking advantage of the natural formation of the land. The talk was well illustrated by good views and maps of the country under discussion.

At the February meeting J. A. Kincead will read a paper on "Spring and Spring Steel," and at the March meeting E. C. Lloyd will read a paper on "Shop-keeping."

CENTRAL RAILWAY AND ENGINEERING CLUB.

The regular monthly meeting of the above club will be held in Room 192, Rossin House, Toronto, on the evening of Feb. 16, when J. M. Dudley will address the meeting on "Railroad Y.M.C.A. work."

NOVA SCOTIA MINING SOCIETY.

The annual meeting of the Mining Society of Nova Scotia will be held on March 3, 1909, at the rooms of the Society, 129 Hollis Street, Halifax, N.S. The annual dinner will be held during the session.

TORONTO E.L.M.B. SOCIETY.

The eighth annual meeting of the Toronto Electric Light Mutual Benefit Society was held recently at the Scott Street plant, for the election of officers and other business. The secretary-treasurer, S. M. Lewis, reported that he had paid out sick benefits during last year amounting to $385.65, and death claims $80, and had a cash balance to divide among the members of $506.85.

The election of officers follows:—Hon. Pres., J. J. Wright; Hon. Vice-Pres., W. Bourne; President, T. Marshall; Vice-President, J. Croucher; Secretary-Treasurer, S. M. Lewis.

PERSONAL NOTES.

A. Chamberlain is in charge of the Belleville Portland Cement Company's new Toronto office, 24 Yonge Street Arcade.

John Coulter, Brantford, has been appointed general manager of the Ontario Portland Cement Company, in place of the late W. G. Elliott.

A. Watt, acting locomotive foreman, Melville, Sask., has been transferred to Wainwright, Alta., with charge of the motive power and car departments.

Charles Ley, of the Canadian Iron Foundry, St. Thomas, leaves shortly for Fort William to become the assistant superintendent of the plant there.

J. C. Houck, superintendent of the Forbes Malleable Iron Works, Rockford, Ill., has resigned to become superintendent of the Valleyfield Iron Works, Montreal.

R. D. Smith, heretofore road foreman of locomotives, Medicine Hat, Alta., has been appointed district master mechanic, district 2, Western Division, with office at Medicine Hat.

J. J. Broadhurst, late metallurgical expert for the James Robertson Co., Montreal, is now in business for himself at 101 Shannon St., Montreal, trading as the Lion Metal Company, smelters and refiners.

The Concrete Engineering & Construction Company, of Toronto, with offices formerly in the Stair Building, have taken up their new offices in the Union Bank Building, Wellington Street West.

Mr. John J. Gartshore, dealer in railway equipment, Toronto, has recently removed to more commodious offices at 58 Front Street West, but still retains his storehouse and yard at his former address opposite the Queen's Hotel.

F D. Lyman, manager of the tube department of John Millen & Son, Montreal; W. K. Gillespie, chief draughtsman, Dominion Car & Foundry Co., Montreal; and Fred. B. Kilbourn, superintendent of the Lakefield Portland Cement Co., Montreal, have been elected members of the Canadian Railway Club.

Several important changes in the Canadian Pacific western divisions are announced, including the appointment of a new superintendent at Brandon. W. J. Uren, at present chief despatcher at Winnipeg, is promoted to the position of superintendent at Brandon. T. R. Flett, who is now superintendent at Brandon, is transferred to be superintendent at Saskatoon, while C. S. Maharg, who has been superintendent at that point, has been transferred to be superintendent at Medicine Hat.

METAL MARKETS.

Although trade in Canada has been steady during the month with an improving tendency all the way along, prices in tin and copper have declined. This, of course, has been the result of weakness in the primary markets, consumption in these metals, both in London and New York, being very poor. The jobbing price of tin received two cuts during the month of ½c, and quotations now are ranging around 32c. This decline may have had the effect of stimulating the purchasing of those who were in want of the metal immediately, but it has the tendency of holding off orders for future requirements. Falling prices do not inspire confidence. Purchasers naturally wait to see if prices will go any lower. Inquiries are good however, and there is no doubt that an improvement in the markets would quicken much buying. Tin is so speculative that it may jump up strongly any day in London, but until steady consumption sets in both, London and New York, the primary markets will not show stability.

Copper received a cut of ¼c during the month and jobbing lots are now ranging between 15 to 15¼c. There has been a fair amount of metal passing into consumers' hands and inquiries, as in the case of tin, have been very favorable. Here again a hardening tendency in primary prices would help business along. New York figures show the hammering which the market has experienced from poor consumption. Producers have been trying hard to hold prices by keeping off the market, but this position is difficult to maintain in face of the stagnation in consumption and the enormous rate of production. A strong legitimate demand is imperatively needed.

Pig iron and steel conditions have shown very little change. Canadian furnaces have been reported busy, and prices have been maintained. There has been some talk of finished steel products in the States being shaded, but the improving business appearing latterly will probably put a stop to this. Pig iron prices have been unchanged across the border with business quiet. There is a strong undercurrent of confidence as to the trend of business, and producers are not anxious to book too far ahead. Spelter has kept at $5.50 in the Canadian markets with very steady business doing. Both the London and St. Louis markets have kept firm, and the metal has shown great stability all the way through. Imported lead has declined 10c, and quotations are now at $3.70 with Trail about 10c less. Business has been fair, with a somewhat improving tendency. The English markets at the commencement of the month were on the weak side, but got stronger later. Altogether trade in Canada has been very steady, and there is a strong feeling of confidence as to good spring business. What is wanted to quicken buying is the encouragement of stronger markets.

LITTLE THINGS IN THE PATTERN SHOP.

By John Carr.

As in our ordinary every day life there are many little things which, if given proper attention will greatly help to make our lives happy and successful, so in Pattern making there are many

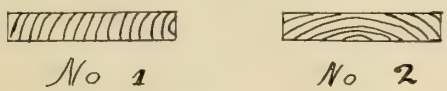

Fig. 1.

little things, which, given their proper attention, help materially in making a perfect pattern, but which slighted, as they too often are, cause trouble after the pattern has left the pattern shop.

One of the little things is choosing the right kind of lumber for the work required. This means more than picking pine that is clear of knots and free from wind-shakes. The grain should be soft and fairly straight, as red stringy pine will twist very readily. For small patterns requiring to be kept for constant use, hardwood should be used. Mahogany, black walnut, cherry and maple are the best kinds for this work. As the choosing of right thoughts is the foundation of a good character, so choosing of the right kind of lumber is the foundation of a good pattern.

Besides choosing the right kind of wood for your pattern in general, it is sometimes necessary to make a particular choice for a particular piece of your pattern. As an instance: it may be necessary to have a loose flat piece put on your pattern with draw pins, or screws that can be taken out to allow pieces to be taken out of sand after body of pattern has been drawn. For such a piece the grain should be quarter cut, that is the end grain should be as shown in No. 1, Fig. 1, not as shown in No. 2, Fig. 1.

Good judgment requires to be used in glueing pieces together. Fig. 2, shows five methods of arranging the grain in glueing up a block. No. 1 will

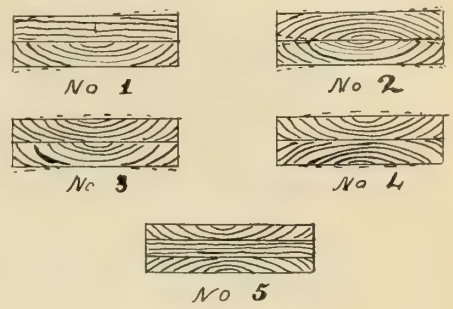

Fig. 2.

twist across the corners, as indicated by dotted lines, No. 2, will open up at the edges, No. 3 will have a tendency to get rounding on one side, and hollow on the other, No. 4, to become slightly rounding on both sides, No. 5 will keep straight and although it takes a little more work, for a permanent pattern it will pay to take the extra time.

When glueing up the segments for a ring, such as a pulley rim, remember that two layers will always twist out of shape, while three layers will remain straight. The reason for this is, when two pieces are glued together one side of each layer is exposed to the action of the air, thereby drying the outer surface more quickly than the centre. Wood patterns will absorb moisture from the sand during the process of moulding, which moisture gradually

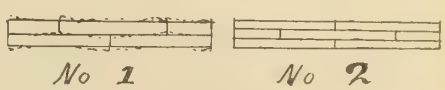

Fig. 3.

dries out when patterns are put away for future use. Fig. 3, shows edge view of such a ring with joints marked in No. 1, as they would appear put together in two layers, the dotted lines showing its tendency to warp. No. 2 shows joints as they would appear when built in three layers. This

pattern will keep its shape as the centre layer is protected from the air on both its sides and will hold the outer layers in position, providing the joints are well made and properly glued.

Just as in your character building, if you do not put your thoughts together intelligently your character will be warped and twisted, so you must use good judgment in building a pattern or it will not keep its proper shape.

It is frequently necessary to nail patterns together in box form. Fig. 4 shows the first step in putting together a box pattern, different methods of nailing a plain board on the edge of another. Most patternmakers think that, if they get their piece in the right place and "hit the nail on the head," their whole duty toward that nail is done. But before they hit the nail at all they should see that it is going to do the most effective work possible when driven home. Referring to Fig. 4, the two nails in each of Nos. 2 and 3, will hold more than the three nails in No. 1, owing to their slanting position, a moment's thought should convince anyone of that. The different disposition of nails in Nos. 2 and 3 is owing to the difference in disposition of grain of board being nailed. No. 2 would have a tendency to curl up at the outer edges. You therefore require to get a sure grip on the outer edges. No. 3 would tend to raise in centre of the board, therefore get your grip as near the middle as feasible. In these days of rush work, most patterns are nailed more or less, and even though glued as well it is wiser to always slant your nails where possible, noting at the same time the grain of your wood. Then drive your nails to the best advantage.

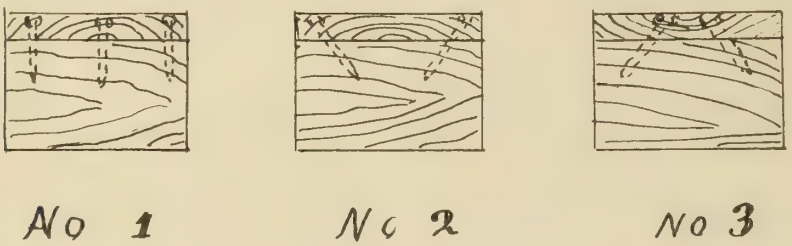

Fig. 4.

Those are a few of the little things which help to make the difference between a good pattern and a poor one, between a pattern that will stand a lot of use and considerable rough usage in the moulding shop, and a pattern that will go to pieces after being used three or four times. These little things are mentioned here to stimulate thought along these lines and to show the need for having the attention set upon the work in hand.

A. F. A. ANNUAL CONVENTION.

The annual convention of the American Foundrymen's Association and allied bodies, including the Foundry and Manufacturers' Supply Association, the American Brass Founders' Association and the Associated Foundry Foremen, will be held in Cincinnati on May 17 and following days. The meetings of the American Foundrymen's Association will be held on May 18, 19 and 20, while the exhibits of foundry equipment and supplies, which will be conducted by the Foundry and Manufacturers' Supply Association, will be open for inspection the entire week. The Hotel Sinton has been selected as headquarters.

Secretary Richard Moldenke in his announcement requests that foundrymen prepare papers and select subjects for discussion at this gathering which can be used by all of the members to their mutual advantage. He states that a mere memorandum embodying the idea will be highly acceptable, and the subjects will be thoroughly discussed by those familiar with the work.

The exhibit of foundry equipment will be conducted under the auspices of the Foundry and Manufacturers' Supply Association and will be held in Music Hall where ample space is provided for both the still and operating exhibits. The first floor of the hall contains about 27,000 square feet of floor space and the second floor about 14,000 square feet.

MAKING MANGANESE BRONZE.*

By J. F. Webb.

To make a manganese bronze, or rather, a manganese brass as it should be called, the mixture generally used is composed of copper, 56 parts; copper manganese, 5 parts; zinc, 36 parts; aluminum, 3 parts.

This mixture is one of the high tension brasses, and there are three points the melter has to keep in mind, namely, tensile strength, elongation and fracture. And when made according to specifications the alloy must not have less than 60,000 lbs. tensile strength and 20 per cent. elongation.

In charging the crucible we put all of the copper in first and with it some of the gates and heads which helps to melt the copper faster, and when all of the copper and gates are melted then we add zinc, then the manganese, and last of all, the aluminum. And I wish to emphasize that manganese bronze can't be mixed and stirred too much. Before the metal is taken from the furnace we have to sample it to see if it is all right, and the way we have of sampling it is to take a long ladle and dip out about a pint and pour what we call a sample bar $\frac{3}{4}$"x$\frac{3}{8}$"x9"; this is the melter's test. The test pieces we cool in water, take and stand it up in the vise to try the strength of it, for we can generally judge the strength by the amount of hammering it will stand and how far it will bend before breaking. And if we find it very stiff and hard to bend it needs more elongation. The way to get more elongation is by keeping the mixture in the furnace 15 or 20 minutes longer with a good heat on, and we may also add a small hand scoop of turnings of the same mixture, which will give more elongation and also helps the fracture.

Then we take another sample test bar and go through the same operation in the vise, and should we find it too soft and easy to bend we add a little aluminum to harden it. Sometimes we have to try two or three times before we get the metal where we want it. Then we pour the molds; also pour the standard test bar that goes first to the machine shop to be turned to size and then to the testing room to be tested, and it is there determined whether the castings shall be accepted or not.

But we have sampled this metal so much in the vise that we can generally tell whether it will stand the physical test.

This alloy, like all others, has its own peculiarity; that is, it leaves the sand very clean, aluminum is good for that, but it has a very bad habit of shrinking, and in making a good deal of our work we have to put on such large heads that we often have as much metal in gates and heads as there is in the casting. But the heads have to be there and should there be several hubs or bumps or heavy corners on the pattern there has to be a head to take care of each one. The alloy also has some good features. It runs very solid and dense, as is the case with any metal that has much shrinkage. And it works very easily in the machine shop and has the appearance of gun metal. It can also be worked hot on the anvil just like a piece of good copper. And I believe it can be forged into most any shape, for I have seen it twisted like an auger.

* Paper read at meeting of Tri City Associated Foundry Foremen.

Foundry Machinery—Molding Machines, Flasks, Mills, Etc.

Extract of Report of Committee of Stove Founders' National Defence Association on Foundry Machinery—Descriptions are Here Given of Molding Machines and Patterns, with Costs and Conclusions Arrived At.

(Continued from January Issue.)

Nearly all machines, and certainly all those that would be recommended for use in the stove foundry, are designed to take different patterns, and in many cases a wide range of shapes and sizes. The change from one pattern to another can be effected by those somewhat accustomed to the operation in from a few minutes to an hour. Without doubt it is economy to run the same pattern for not less than a day at a time and change patterns outside of molding hours. Where the double-faced matchplate is used the change is so readily made as to be of itself a matter of no moment. Where changes must be made in molding hours the cost of molding will, of course, be higher.

Some of the items of cost offsetting reduced molding prices are the extra help in handling iron, flasks and sand ; cost of making changes of patterns ; the depreciation of and repairs to machinery.

On very large floors and where the iron is brought to the floor we find that two hours help of a laborer in shifting weights, strippers and in shaking out is all the help that is required. The cost of repairs to machines and patterns is very slight.

The manner of figuring depreciation on machinery varies so widely that it is deemed sufficient to simply call attention to this item, leaving it to each manufacturer to figure in his own way.

The cost of making patterns for the machine may be varied in accordance with the number of pieces to be made and with the type of machine used. The cost of distributing iron to the floors from the cupola will vary in accordance with the size, layout and facilities of the shop. We found in some foundries the practice of delivering iron to the molders' floors already established and in such cases, of course, this would not form an item of additional cost. The use of the trolley system for carrying iron, where this becomes a separate item of expense to the manufacturer, is recommended.

General Conclusions.

The conclusions formed by the committee after the study of molding machines are in brief as follows :

The stove industry is far behind others in the employment of labor-saving machinery and devices. Molding machines are successfully used in some stove foundries to reduce molding cost.

Those institutions that are making the most use of the machines are also those that are most rapidly adding to their equipment.

All stove patterns can be molded with some form of machine or device already in use.

It is merely a question of the cost of patterns for the machine and the number of pieces to be made whether or not it will pay to mold the piece in question by machine. For bench work the number so required to be made to make machine molding profitable is about 1,000 molds for the more expensive pattern rig and a correspondingly small number for the less expensive rig.

It requires a smaller number of large pieces to be made to pay for new pattern equipment since the saving per piece is larger in proportion to cost of pattern than in the case of small pieces.

Through the use of these practically indestructible pattern plates in place of loose iron patterns, the cost of maintaining patterns in repair is reduced and the necessity of preserving and caring for duplicate sets of patterns in wood or iron obviated.

The best results may be obtained from a system of specialized labor which allows the machine operator to devote himself exclusively to molding and pouring, that is, allows the machine operator to perform only such work besides actual molding which will still make it possible to hold him responsible for good castings. Carrying iron, shifting weights and strippers, shaking out, and if possible, cutting over sand should be performed by common labor. This suggests the employment of surface or overhead carriers as labor-saving devices.

A saving of about 5 per cent. of iron in machine over-hand molded castings seems not unreasonable to expect. An incidental effect on factory economy is suggested by the report of a case where a reduction in the cost of grinding and mounting small cast ranges was secured, after the castings were molded by machinery.

The manner, most apt to be successful, of making molding machine installation, is :

First, determine that you have enough patterns of which the necessary number of molds are to be made to keep a number of machines busy.

Second, see that your organization from manager to machine operator is prepared to back the machine with intelligence, energy and enthusiasm.

Third, select carefully the make of machines best suited to your work. Start with not less than two machines and let all be of the same make ; this simplifies matters, gives an opportunity to make competition between operators, and avoids concentrating on one man all adverse criticism of influence.

The increased use of molding machinery will result in increased standardization of parts and reduction in the variety of patterns.

Automatic Polishing Machinery.

We found both eight and ten-arm machines in use, the latter being of more recent design. The ten-arm machines are recommended as having a larger capacity and costing little, if any, more to operate.

The cost of the machine is : Eight-arm, $2,500 ; ten-arm, $3,000.

The average cost of fallow-boards is reported $1.85 to $4.50.

The number of fallow-boards required depends upon the variety of work to be polished, the maximum number, of course, being required where the variety is greatest, and the number of each piece to be polished smallest. Conversely, the number required is least where the variety is smallest, and the number of each piece to be polished maximum. The machine requires about 15-horse-power to drive it.

Castings to be polished on the machine must be flat or oval. In proportion as a piece is very large or bulging the work of touching up such parts of the area to be polished as are not reached by the machine wheels is increased and the approach to the cost of polishing by hand the nearest. On the other hand, in proportion as the work is flat and finished complete by the machine the work of touching up is reduced and the saving greater. Further, large, heavy work on which a premium is sometimes paid to polishers on account of its size and difficulty of handling, is as easily handled by the machine as small work, and the saving in this class of work is proportionately the greatest. The machines are usually designed to do work running from twenty-

four to thirty inches in width to any length required.

The number of men attendant upon the machine is variously reported from one laborer at $1.50 to $2 per day to two polishers at $4 per day, and part time for the third at $4 per day. The number of men required to touch up work after the machine varies from one to four. They are sometimes journeymen, sometimes apprentices; generally paid by the day but in some cases working piece work. This number will vary with the amount of work turned out by the machine.

The total cost of operation runs from $4.25 to $17.50 per day. These figures include all costs of operation and keeping machine and fallow-boards in repair. The cost of operation, however, is almost entirely labor cost and the largest part of this cost is for touching-up after the machine. We find, therefore, that in cases where the total cost of operation is greatest, the amount of work put through is greatest, and the savings both in amount and in percentage of hand-polishing prices are greatest.

In round numbers the output of the machine varies from two hundred to four hundred pieces per day and from $7 to $43 in terms of hand-polishing prices. The corresponding daily savings over hand-polishing are $3 to $26. The percentage reduction from hand-polishing cost runs from about twenty-five to eighty.

Facing Machine.

The committee encountered an interesting machine by means of which better and cheaper work can be done in fitting oak doors, facing registers, etc. This machine is a home-made affair, consisting of a stand and bearings supporting a vertical spindle on the upper end of which is mounted a large cast iron disc with machined face. The face of the disc is set up with coarse emery cloth.

The door or piece to be fitted is laid upon the face of the disc, where it is held in place by a frame work built over the face of the disc, while the disc is rapidly revolving. After being faced in this manner little work remains to be done in order to make a tight-fitting door. With this machine one man is able to fit as many base doors as three men without the help of the machine and by the method generally in vogue.

Polishing Mills.

Two different types of polishing mills were found in use; one in the form of a cylindrical drum with cast iron trunions; the other oval in shape, made entirely of cast iron and hung from accentrically-placed trunions. Good results were secured with both.

The majority of the users of the water mill make only a limited use of the mill to polish the smallest and lightest castings. Others who have made a special study of the use of the mill have succeeded in successfully polishing in it much larger parts, up to 7x14 ins. Parts which have an unbroken plain surface are successfully polished up to 2x6 ins. in size. Where part of the piece is background work with comparatively little plain surface, pieces of the size mentioned, namely, 7x14 ins., are successfully treated. It may be that better results are obtained of which we have no information, at all events these are definite figures given the committee and as far as the size only is concerned there is no reason why a large proportion of our stove plate may not be polished to advantage in this manner. Some of the work polished in mills are: handles, shakers, cranks, registers, keys, knobs, urns, small feet, drop shelves, registers, ash guards, base strips, base burner legs and over door panels.

The weight of castings that may be charged into the mills depends upon its size, method of working, and character and amount of material charged with the castings. Examples are: 150 lbs. in a 15x22-in. oval mill; 1,000 lbs. in a 20x30-in. cylindrical mill; 250 lbs. in a 22x60-in. cylindrical mill. The daily output per mill runs from 50 to 250 lbs. The time of running a mill varies from two to seven days.

The materials used as abrasive agents in the mills are sandstone, emery, sharp sand, granite, cast iron stars, limestone or marble chippings, or several of these materials in combination with water added. Sandstone seems to give the best results, though a charge of 15 to 20 pounds of granite, 10 pounds of cast iron stars with 500 to 700 pounds of casings, used in one plant regarded as having the most advanced practive, gives good results.

For small work and work having comparatively little plain surface, no other polishing than that done by the mill is required where the requirements are not exacting. The finish, however, is not equal to hand work and where the best finish is required the work requires finishing on an oil wheel. In some cases the work is oiled and colored.

The cost of mills is variously given from $20 for a home-made 18x40-in. cylindrical mill to $200 for 22x60-in- cylindrical mill, also home-made. The cost of cast iron oval mills, 2x4-ft., is reported to be $100.

The cost of power, breakage and materials, is reported at one-twentieth of a cent ($.0005) per pound. This seems too small a figure and it would be safer to figure it to cover merely the breakage and cost of materials.

The cost of power, figuring one-horse power for a mill carrying four hundred pounds of castings, running forty hours, would be fifteen-hundredths of a cent ($.0015) with power at one cent per kilowatt hour.

The cost of power, breakage and materials together are more conservatively estimated at two-tenths of a cent ($.002) per pound.

The cost of labor for operating mills is reported variously from one-twentieth of a cent ($.0005), to nearly two-tenths of a cent ($.002) per pound, the variation being due to differences in machinery, method and character of work, as well as the rate and pay.

The cost of polishing labor for finishing after milling is from two-thirds of a cent ($.0066 2-3) per pound to $.01 1-2 per pound, or from twenty-five to fifty per cent. of the polishing price. Where the polishing price is for four or five-wheel work, twenty-five per cent. should be quite enough to pay for the finishing on one oil wheel. This may be safely said in view of the fact that the high figure is reported in one case only. In one case the practice is to rough out before milling. This costs from eight to twenty-one per cent. of the polishing price. Oiling and coloring after milling in one case is reported as costing 28 per cent. of the polishing price.

One case is reported of a mill charged with 250 pounds of castings, running 40 hours, and taking two and three-quarters hours to load, which only netted a saving of $1.43 for a load, or about 6-100 of a cent ($.0006) per pound. This is the net saving after deducting all costs and is for castings that have to be highly finished. This example shows the lowest rate of saving reported and does not represent the average, which is much more favorable.

The items of cost per pound of mill polishing compiled from answers to our inquiries is tabulated here:

Materials and breakage.	$.0005 to $.0005
Power	.0015 to .0015
Mill labor	.0005 to .0020
Polishing labor (finishing)	.0007 to .0150
Polishing labor to finish same work entirely by hand	.0240 to .0500

Polishing is also done in such mills by the dry process. Having, however, no information concerning the details of the process, we can do nothing more than simply call attention to its use. Likewise we find that such mills are also used for buffing after plating. Concerning buffing we, likewise, have no data which would be valuable and simply call attention to the use of what may be another valuable labor-saving device.

How the Apprentice Got Even With the "Smart" Mechanic

Experiences of an Apprentice when Learning his Trade, Showing What he was "Up Against" and how he Overcame his First Difficulties.

By THE APPRENTICE

They say that "All work and no play makes Jack a dull boy," and I guess it applies to mechanics as well as to schoolboys. Anyway that was the way it appeared to me when I entered on my duties as an apprentice. It was a timid enough chap that approached the foreman one Friday afternoon and asked for work, but when he said, "Come to work Monday morning," I was the most important chap in town. At least that was how I felt. I strutted around town and looked down on my school chums as far beneath me. But my awakening was to come. I didn't know what was before me or I should have been a little more reticent. By seven o'clock Monday morning the timid air had completely vanished and with a head swelled to twice its normal capacity and a new clean set of smock and overalls, I approached the foreman. Before many hours were over I realized there was something to learn. Of course I made a darn fool of myself, but I got the bumptiousness knocked out of my noddle.

The fun wasn't all on one side however, and I laugh yet when I think of the time I gave the shop "smart Alex" a few "shocks," but I will tell of them later.

My first job was threading some bolts on an old lathe that must have been invented when Noah was building the ark. However, it worked, but that is all that can be said. The efficiency of the machine must have been about 5 per cent. The machine was situated in a corner of the shop known as "devils' corner." I soon learned what that meant.

After working steadily for an hour I ran out of material and looked around to get a wheeler to bring a load of bolts. When my back was turned the fellow on the bench nearest me, Bill, loosened the die in the socket, and when I came back after getting a wheeler the die was wabbling like a sick hen.

I asked Bill what the matter was. He approached the old lathe and looked so serious I thought the machine was done for. He said he could fix it if I would go into the forge shop and get the trip hammer. I couldn't find the boss and asked a fellow there, and he said to get a truck and he would show me where it was.

I came back to the machine shop and the first person I ran into was my own boss. He wanted to know what I was running around for and said that I must stay at my machine. I told him what I was after and in his gruffest voice he ordered me back to my lathe. I was sure Bill wouldn't like it if I didn't get that hammer so, as the boss went to an upper flat on the elevator, I got a truck and went after the important trip hammer. When I went to the forge shop the fellow said the hammer had just been taken to the carpenter shop. I came back with the truck and took the elevator to the carpenter shop. When I was stepping off the elevator, I ran into the boss again and was sent back to my machine in a hurry. When I got back they all laughed and when I told them about running into the boss they roared. I noticed that my machine was running alright again so went to work and said nothing. At one o'clock I hunted up the forge shop boss and asked to see the trip hammer. Then I saw the joke.

I got back at Bill for that though. Bill used to fix the electric lights. That is, he used to put in new carbons every day and do any wiring necessary. He used an iron pail to wash in and I knew enough about electricity to know the iron and water were good conductors. Tuesday evening Bill filled the pail as usual and when he was taking a look around the shop I attached wires to the pail. He came back, and in about five minutes to six prepared to wash-up. He got out his soap and leaned over the pail, but he didn't get much farther and the joke was on him.

The Apprentice Gets Even with Bill by Attaching a Wire to the "Soup" Pan and Belt.

One day shortly after we were sitting around a few minutes before one, when Bill proposed that I take a chew of tobacco. I rebelled at first but was jollied into it. Gosh! I've never touched it since. I went out into the castings department and crept into a bin. I was good and sick. I have heard of green apples and buttermilk and ocean trips, but I am sure they couldn't hold a candle to this. I no longer wanted to be a mechanic, but I stuck at it and resolved to pay Bill back.

My opportunity came before very long. Bill was turning some shafts on a lathe one day and had underneath a large pan to catch the "soup" as it dripped down from the tool. I was back early at one and noticed the pan half filled with "soup." I saw that this was my opportunity to "get even" with Bill. I got a piece of wire and attached it to the back of the pan and the belt. Bill never noticed the wire and he started up the lathe. He noticed it then, but I was sorry for him afterwards for he had to spend the whole afternoon in the shop with wet feet.

I learned that the best way to take anything was with a grin, but as sure as Bill fooled me I got back at him and before I was there very long Bill and I were the best of friends.

My next fool trip was to the foundry to bring in a cupola. I got it—yes—where I deserved it. The foundry foreman was a gruff old fellow and kicked me out. I resolved that Bill would be punished for it and I laid plans accordingly. The fellow on one of the screw turret machines was away one day and Bill was running it. During the day he had to leave it to fix the lights and when he returned I had electric wires attached to the machine. There was no current, however, until late in the afternoon when the lights were turned on. When they were, Bill had an awakening, for he found he couldn't leave his machine. A fellow near broke the circuit by pulling the wires off the machine with his hammer. Bill was going to kick me out for it, but decided I wasn't to be fooled with after that and sent me on no more fool errands.

I had seen enough, however, to take away the bumptiousness and found there were many things to learn before I could call myself a mechanic. I'm still learning and hope some day to get my papers.

Reorganization of the Lake Superior Corporation

British Capatilists Purchase Securities of Holding Co. Liabilities to Banks are Liquidated. Additional Capital to be Brought in.

An important epoch has been reached in the affairs of the Lake Superior Corporation of Sault Ste. Marie. Ever since the Corporation was started it has had many difficulties to contend with. Some of these were of its own making. One of its chief difficulties at the start was the fact that like similar industries in new countries, its original cost was excessive. This was a serious handicap.

About five years ago a crisis was averted by the Government of the Province of Ontario guaranteeing a loan of two million dollars. Just about the same time there was also a complete reorganization of the corporation's executive officers, and a holding corporation, The Canadian Improvement Company, was formed to take care of the assets.

When the new executive took control it was found necessary to purchase some $2,500,000 worth of raw material while of funds available it had scarcely half a million dollars.

British Capitalists Invest.

Now the securities of the Lake Superior Corporation have been secured by a group of capitalists, chief of whom is Robert Fleming, of London and Edinburgh, a gentleman whose name stands high in the financial world. Associated with Mr. Fleming is F. S. Pearson the engineer of London and New York, who will take a prominent part in the direction of the undertaking. He is already interested in the Canadian iron and steel industry, being a director of the Dominion Iron & Steel Co. and of the Dominion Coal Co.

The process of reorganization is being proceeded with, and will soon be completed. In the meantime the liquidating of the corporations liabilities has been accomplished. It was stated by one of the executive officers of the corporation that on Tuesday, January 12th, the last dollar owing the banks had been paid off, including loan guaranteed by the Ontario Government, $1,000,000 of which was paid off some time ago. Eighteen months ago its liability to the banks aggregated about $2,500,000.

The next move of President Warren and the directors is to secure additional capital to extend and improve the various plants of the corporation and to complete the construction of the Algoma and Hudson Bay Railway. Grading on this road is practically finished.

The Officers of the company are: President, Chas. D. Warren; 1st Vice President, J. Tatnall Lea; 2nd Vice-President, Thomas J. Drummond; Treasurer and Secretary, Walter P. Faust.

The capital stock authorized and outstanding is $40,000,000; first mortgage bonds authorized, $10,000,000; outstanding about $9,000,000; income bonds authorized and outstanding $3,000,000.

Thirteen Subsidiary Companies.

The subsidiary companies owned and operated by the Lake Superior Company number thirteen. They are: Algoma Central & Hudson Bay Railway Company, Manitoulin & North Shore Railway Company, Algoma Commercial Company, Limited, Algoma Iron Works, British-American Express Company, Algoma Steel Company, Limited, Lake Superior Power Company, International Transit Company, Trans-St. Mary's Traction Company, Tagoma Water & Light Company, Sault Ste. Marie Pulp & Paper Company, Michigan Lake Superior Power Company, Lake Superior Iron & Steel Company, Limited

According to the report of the directors, presented at the annual meeting in October, 1908, the operations of the various subsidiary companies during the preceding fiscal year showed a net surplus of $1,072,000, an increase of $214,870 over the previous year, and this in spite of the fact that the steel plant had been closed down for a considerable time.

Two Blast Furnaces.

The Algoma Steel Co., one of the subsidiary concerns of the corporation operates two blast furnaces, each of a capacity of 250 tons of pig iron per day. Since the steel works were established these furnaces have been unequal to the demands made upon them and an increase in the capacity of these furnaces to 500 tons per day is necessary for their own requirements.

The Bessemer plant consists of two convertors of four tons capacity each. The rail mill which is the first started in Canada consists of three stands of rolls. The plant is laid out with a view to handling rails from 30 to 60 feet in length and of eights up to 100 lbs per yard.

In addition to the Bessemer convertors there are two basic open-hearth furnaces each of a total capacity of 400 tons. The capacity of the blooming and rail mill is 600 tons per day.

The output of pig iron by the Algoma Steel Co. during the last three years was: 1905, 66,235 tons; 1906, 130,902 tons; 1907, 135,852 tons. The output of standard steel rails was: 1905, 98,822 tons; 1906, 159,740 tons; 1907, 142,958 tons.

The open hearth furnaces started by the Lake Superior Iron & Steel Co. last year produced 25,321 tons of open hearth rails.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop Notes.

Ernest Sneider has established a foundry at Morden, Man.

The Defiance Iron Works, Chatham, recently added 15 men to their staff.

The Grand Trunk car shops at London have re-opened with 460 men on the pay roll.

The by-law to loan $20,000 to the Standard Implement Co. was defeated in St. Thomas.

The Hydraulic Manufacturing Co., of Seattle, have opened a water pipe making plant in Victoria.

Philadelphia interests are said to be urging the Polson Co. to double its ship-building yards at Toronto.

The foundry of the McClary Manufacturing Co., London, has now a staff of 430 men at work on full time.

The White Sewing Machine Company, Cleveland, is considering locating its Canadian branch in Hamilton.

The Silliker Car Co., Halifax, has added a brass furnace and brass molding equipment to their extensive plant.

New machinery was recently installed in the Wallaceburg Brass Works for the manufacture of metal rings for gem sealers.

It is understood that the Union Drawn Steel Co., Hamilton, is negotiating for the erection of a large steel plant in Buffalo.

After being closed down for over a year, the American Abell Engine and Thresher Company's molding shop, Toronto, has resumed.

W. W. Butler, of the Dominion Car & Foundry Co., Montreal, says that steel passenger cars will soon come into use in Canada.

Again there is talk of John W. Gates building a big steel plant at Toronto or some other place in Ontario to utilize Moose Mountain ore.

Fleming & Roys have opened up a machine shop at 119 Simcoe Street, Toronto. They will make a specialty of automobile repairing and marine motor work.

The engineering works of M. W. Cunliffe, of Rossland, were partially destroyed by fire, which broke out shortly after closing time. The estimated loss is $10,000.

There is a probability of the Dominion Iron & Steel Co., at Sydney, C.B., enlarging its operations by manufacturing lime and the various by-products of its iron plant.

The Vulcan Company, which some time ago purchased the plant of the William Malloch Co., London, intends going into the manufacture of furnaces, stoves, elevators, etc.

The Victoria, B.C., Machinery Depot are adding the newest and most up-to-date patterns of labor-saving machines to their plant to replace those destroyed by fire last year.

Goldie & McCulloch's big factories in Galt are in full swing with many orders ahead. McGregor & Gourlay, in the same town, are also busy and have put on a night shift.

The Goold, Shapley & Muir Co., and the Verity Plow Co., Brantford, have started on full time, and the Cockshutt Plow Co. will run each evening until nine o'clock.

The Amherst Foundry Company, Amherst, N. S., is working to its fullest capacity and large orders from the upper provinces and the west are being filled as rapidly as possible.

The firm of Foley & Williams, of Chicago, manufacturers of the Goderich sewing machine, are soon to open a Canadian branch in Guelph, making that city their headquarters for the Dominion.

Webb & Scott have opened a machine shop at the rear of 12 Keele Street, West Toronto. Besides doing a general automobile and gas engine repair business, they will build special machinery.

The warehouse of the Buck Stove Co., Brantford, occupied by the Hampel Box Co., was burned out last week. New machinery will be ordered, and the firm will recommence work as soon as possible.

The plant of Clark-Demill Co., Hespeler, Ont., has been sold to the Hespeler Machinery Co., a new concern, of which George D. Forbes is president, and W. G. Chater secretary-treasurer and managing director.

The Massey-Harris Co. has increased its capital stock by $2,000,000, making the entire capital $10,000,000. The company has a full staff of men, not only at the Toronto works, but also at Woodstock and Brantford.

The Chatham Malleable Iron and Steel Co., Chatham, Ont., report a most successful season for their output of handsleighs and cutters. They expect to construct a new factory in the course of a few months.

Certain parties in London are considering taking over the Mann Brass Works, which went into liquidation some time ago. There should be a good thing in this for any one desirous of going into special lines of manufacture.

C. Richard & Co., 20 St. George Street, Montreal, machinists, etc., have secured a new and larger site for their business. They will make many improvements to the buildings already on the land and intend to move in early in the spring.

The Nova Scotia Steel & Coal Company have just closed a very successful year's business, and the outlook is promising for the coming year's business. The company is looking forward to considerable expansion of its trade in both steel and coal during 1909.

E. Housey, 5 Bathurst Street, Toronto, is putting up an addition that will more than double the capacity of his present plant. Besides continuing to manufacture gasolene engines, he will build a complete line of motor boats, for both speed and pleasure.

The big foundries and factories are increasing their pay rolls in consequence of the rush of orders for iron goods. Managers of every important concern in Toronto anticipate a very busy season, and expect to have their shops running to the fullest capacity in a few weeks.

One hundred and thirty-five men have been added to the staff of the Rolling Mills, at Belleville, the 9-in. and 18-in. resuming operations with full staff. The companies have orders ahead to keep them going for several months, getting out bar iron and horseshoes, the latter department being in full swing.

The Forest Brass Works, Brantford, have received orders for five times the capacity of the present plant. In order to meet the demand it is proposed to increase the capital stock by organizing a joint stock company, with an additional capital of $10,000, much of which is already subscribed.

The Rhodes-Curry Car Works, of Amherst, N. S., have a year's work on hand and their extensive plant will be operated to its fullest capacity. The Dominion Coal Company intend to increase their output next year, and the Dominion Steel Company have several large orders on hand for rails.

One of the busiest concerns in Hamilton is the Chadwick Brothers' brass manufacturing works. It is working night and day, and will erect an addition. One of the biggest contracts is an order for automobile lamps and brass work for such machines for the McLaughlin-Buick Company, of Oshawa.

Among the charters announced this week is one to the Canadian Road Machine Company, of Hamilton. The provisional directors are Robert Mancill, Chester Walters and William Bell. The share capital of the company is $60,000. The company will manufacture, buy, sell and deal in road machinery.

The Dominion Iron & Steel Co. have closed a very busy year. The gross earnings for 1908 were $2,613,815.66, and the production for the past year was : Ore mined, 556,000 tons ; pig iron made, 262,000 tons ; steel made, 277,000 tons ; rails made, 153,500 tons ; wire rods made, 42,000 tons ; other steel products, 33,000 tons ; sulphate ammonia, 8,000 tons ; tar, 4,500,000 gallons.

G. Walter Green, of Peterboro, who has been operating a foundry and machine works that has grown rapidly during the past few years, has received a charter for his business, which will be known in future as the G. Walter Green Co., capitalized at $100,000, with new officers. They will continue to manufacture mill machinery of all kinds, steam engines, wood and iron pumps, etc.

The Canadian Brass Company, Galt, is doing big things with a large quantity of Chinese coin recently imported from China. The brass is of exceptional good quality and can be put to many uses. Several sample candlesticks turned out have attracted a great deal of attention. They are of massive design and ornamented about the base with the real coins nicely polished.

Negotiations at present under way will probably secure for Galt an industry known as the Champion Potato Machinery Co., of Hammond, Ind. Otto Kloenzer is president of the company, which is about to establish a branch in Canada. The firm manufacture potato cultivating machinery and other farm implements. In all probability the building and machinery of the defunct McVicker Engine Company will be taken over.

Fire gutted the foundry department of the Rossland, B.C., Engineering Works, burning a good many patterns and injuring the machine department, with a loss of about $10,000. The brigade had a hard fight for an hour and a quarter, contending with the extreme cold. The water freezing on the machinery prevented the fire from warping it. Wm. Cunliffe, the owner, says he will resume operations as soon as the damage can be repaired.

There is just a probability that the Edge Tool Factory, Galt, recently declared insolvent, will be started again under new management. The officers of the old company are still in charge and are disposing of the manufactured stock. The company turned out an excellent line of goods, were well equipped with machinery and did a good trade, but lack of capital appears to have been the difficulty. It is an excellent opportunity for the proper persons.

The Louden Machinery Co., Guelph are moving into their fine new premises and their old plant, the drill sheds, will be occupied by the Louden Manufacturing Co., manufacturers of all kinds of potato machinery. In addition to this the Raymond Manufacturing Co. have succeeded in completing arraangements with the Foley, Williams Company, of Chicago, to manufacture all their Gooderich machines for the Canadian, Newfoundland, Australian and New Zealand trade.

The Manitoba Iron Works, Winnipeg, are making an addition to their already extensive plant, by adding a structure 450x130, so that the concern will be able to take care of any structural steel contracts of any size. The cost of the addition will be $150,000. When the addition is completed the capacity of the Manitoba Iron Works will be in the neighborhood of 20,000 tons of steel per year, and bridge work of the largest kind can be handled. This concern employs over 200 men, and when the erection of this new portion is completed their staff will be increased to 460.

Municipal Enterprises.

Burlington carried a by-law in favor of a waterworks system.

Almonte carried a by-law to raise $15,000 for street improvements.

Hamilton carried a by-law to expend $ 5,000 on the extension of sewers.

The by-law to expend $3,000 on waterworks extension was defeated in Port Elgin.

Renfrew ratepayers have approved a by-law to expend $5,000 upon sewer extensions.

A gas plant for Fort William is again being brought to the front by the city council.

The ratepayers of Stratford have carried a by-law to spend $25,000 on sewage disposal works.

The ratepayers of St. Thomas have approved a by-law to raise $40,000 for septic tanks for city sewage.

The by-law to provide for the cost of a new filtering basin for the Meaford waterworks has been carried.

A new sedimentation basin built under the supervision of Willis Chipman is now in use by Saskatoon.

An agitation is on foot to obtain a water supply for Richmond Hill, Ont., from the near-by elevation of the Ridges.

The Ontario Railway and Municipal Board have approved a by-law to raise $28,000 for sewer construction at Fort Frances.

A. F. Macallum and T. Aird Murray, consulting engineers, Toronto, are preparing plans for the instalation of the proposed sewerage system in New Toronto.

An ammonia plant is the latest civic revenue producer in St. Thomas. The 6,000 tons of coal carbonized yearly at the works will produce about 18,000 pounds of ammonia, giving the department a revenue of $900 yearly on an investment of $2,000.

Within a few days the mains of the Seymour Creek water system will be connected with the Vancouver city system and the available water supply of Vancouver will, by that action, be doubled, giving a service in the field capable of meeting the needs of 180,000 people.

The Montreal Locomotive Works have received orders during the last few days for 55 engines. The C.P.R. has ordered 30 engines of the standard Pacific type with 21 by 20-inch cylinders, 69-inch drivers, and a light weight, including tender, of 215,000 pounds. The G.T.P. has ordered 25 locomotives with 18 by 24-inch cylinders, 69-inch drivers, of the standard eight-wheel type of the "440" class, the total weight being 121,000 pounds. Delivery of these orders will be made in May.

City Engineer Edington, of Moncton, N. B., has just presented a complete report of the water and light committee as to the advisability of increasing the city's water supply. The plans submitted would entail an approximate expenditure of $217,000, made up as follows :— Embankment, including gate house, wasteway, etc., $87,000 ; 20-inch leading main, $87,400 ; cleaning bed of reservoir, $5,500 ; diversion of Alexander Road, $1,200 ; land and damages, $5,000 ; contingencies, $6,000 ; total, $192,100 ; pumping station, $25,000, making a grand total of $217,100.

At the meeting of the Vancouver Board of Works a letter was received from the Decarie Incinerator Company, offering to put in one of their 40-ton destructors, or to take over the present incinerator and work it on their plan. It is the intention of the city to instal another incinerator. There was some discussion over the letter. Ald. McMillan moved that it be filed, as the Decarie incinerator had been a failure in Winnipeg, and there was no use, anyway, in changing the present satisfactory system here for an unsatisfactory one. As the Decarie Company invited inspection of their plant at Spokane, Wash., an amendment was moved that the offer be accepted if the expenses of aldermen and accompanying newspapermen were paid. This motion was defeated by the casting vote of the chairman.

Railway Construction.

The Railway Commission has ordered a via duct for Toronto.

The C.N.R. have decided at last to build the line between Port Arthur and Sudbury.

The Delaware & Hudson propose running a branch into Sherbrooke from its Montreal line.

The Sydney-East Bay Electric Tram Railway will build seventeen miles of road this year.

The G.T.P. will run regular through trains between Winnipeg and Edmonton in the spring.

The Canadian Northern will construct a line from Macleod to the Great Northern Railway at the Montana border.

The Prince Albert & Hudson's Bay Railway is applying for permission to construct a line from Prince Albert to York Factory.

The construction of the first hundred miles east of Prince Rupert is being pushed and will be ready September 1.

Fort William is asking the Provincial Legislature to sanction a debenture by-law for $170,000 for the extension of the street railway system.

The Canadian Northern and the G.T.P. will build 700 miles of road in Saskatchewan this year, the Provincial Government guaranteeing $13,000 per mile.

The Eastern Ontario Counties Electric Belt Line Railway propose to connect Cornwall, Brockville, Morrisburg, Winchester and Ottawa with a line this year.

An electric railway is proposed to be built between Cobourg and the Kawartha Lakes, and another from Cobourg to Havelock. Each line will be 30 miles long.

The T. & N. O. propose tapping the Elk Lake and Gowganda districts by a branch line this spring. The C.N.O. and C.P.R. also will build lines there this spring.

The spending of a large amount of money on improving and extending the Algoma Central is said to be the intention of those behind the Lake Superior corporation.

The C. P. R. expect to spend $30,000,000 on western lines this year. The Moose Jaw-Lacombe, Sheho-Lanigan, Wilkie-Battle River, Lethbridge-Macleod, and Mowbray extensions will be pushed.

Track-laying will be commenced immediately by the Great Northern at Keremeos, B.C., as well as on the Spokane-Portland line. Grading is being done by the same road between Allison and Princeton.

Malcolm McPherson, Freelton, Ont., has been appointed by John Patterson, Hamilton, to buy the right-of-way from Freelton to Guelph for the projected electric road of the Hamilton & Guelph Railway, of which Mr. Patterson is the promoter.

The St. Mary's & Western Ontario Railway is applying for permission to construct lines from Woodstock to Brantford ; St. Mary's to Stratford ; St. Mary's and Exeter branch to Guelph, and Goderich branch, and from Exeter to Grand Bend.

Railway surveyors have been working along the line of the Kootenay Central last summer, between Golden on the main line of the Canadian Pacific Railway and Galoway, on the Crow's Nest branch a few miles west of Fernie. This line will be completed this year.

The C,N.R. has applied to Parliament for permission to construct lines from Nepigon Bay to the N.T.R., from a point on the Montreal-French River branch to a point on the Hutton branch ; from a point on the Sudbury-Port Arthur line to the N.T.R. at Abitibi River ; from the C.N.O. line into the Temiscamingue country. The railway also asks for an extension of time on various other lines projected in Ontario.

A report from Calgary states that a progressive campaign of railway building in Southern Alberta is being arranged for the present year. A party of surveyors is now working in the vicinity of Pincher Creek and the lines proposed will keep them busy for three months. In connection with the roads which are to run northeast from Calgary to Saskatoon and other points in the Saskatchewan Valley the amount mentioned for the guarantee of bonds is $10,000 per mile.

The present session of the B.C. Legislature will see some important applications for charters for railways in different parts of the province. Behind the application for a railway between Skidegate and Rennel Sound, on Graham Island, one of the Queen Charlotte group, lies the story of a large enterprise. Leigh Hunt, formerly of Seattle, who made a fortune in Corea, and an English capitalist, have formed a company with a capitalization of $10,000,000 to take over 27,000 acres of coal lands on Graham Island from a Victoria syndicate, and development will be commenced. A fleet of colliers will be established and the operations carried out on a large scale, with the object of supplying the northern coast.

Electrical Notes.

Tenders will be received until March 1st, 1909, for a municipal power plant at Lethbridge.

The ratepayers of Galt have approved a by-law to raise $12,000 for electric light extensions.

The by-law to provide $12,000 for the Barrie electric light department carried by a big majority.

The Smith's Falls Electric Power Co. is instaling meters on its whole system of house lighting.

Winnipeg has declared for a municipal power plant and work will be commenced at once on a plant on the Winnipeg river.

The Electric Service Co. is submitting a new draft by-law to the Montreal council with regard to the supply of electricity.

Eight money by-laws for various works, including $25,000 for further power development on the Current river carried in Port Arthur.

It is expected that in about a month's time Toronto will be calling for tenders for underground cable for the down-town electric distributing plant.

The request of the Electric Company for an extension of time in which to continue boring for gas under their contract with Lethbridge has been refused.

The Moncton Electric Street Railway, Heat and Power Co. is applying to increase its capital to $195,000, and is seeking permission to borrow $200,000 to extend its system.

The construction of the B.C. Electric line will be a good thing for the Chilliwack valley. The pumping out of Sumas lake will reclaim a large area of land and the company will develop their immense power.

The large dam which the Vancouver Power Company proposes erecting at the outlet of Coquitlam lake is exciting considerable interest in Vancouver, as well as in the Municipality of Coquitlam.

Delegates representing the Coquitlam and New Westminster councils, as well as from the Board of Trade, strenuously oppose the application of the company for permission to build the dam.

The annual report of the Ottawa civic electric plant shows that the year's operations have been very successfully conducted. The gross revenue was $105,000 and the net profit $15,000, after providing for interest and sinking fund.

The Ontario & Michigan Power Company will seek incorporation to acquire and operate water power on the Pigeon river and the Nepigon river, for the construction of necessary buildings and for the building of electrical and hydraulic works.

K. L. Aitken, chief engineer in charge of the Toronto electric distribution plant, has been appointed by City Engineer Rust engineer in charge of the East Toronto electric light plant. East Toronto's plant has a capacity of 200 h. p. There are 40 arc lights and 132 incandescent lights in the streets, and 100 customers for the electric light.

John Gunn & Sons, Winnipeg, have the contract at $779,100 for the general works at Point du Bois, in connection with Winnipeg's power scheme. The Northern Aluminum Co., Shawinigan Falls, has the transmission line aluminum cable contract at $148,050, and the steel towers contract goes to the Manitoba Iron Works, of Winnipeg, at $87,500.

Halifax county council after some discussion decided to guarantee the bonds of the Halifax and Suburban Electric Company, to the amount of half a million dollars. Parties interested in the Waverley gold mine are ready to furnish the capital for utilizing the Fall River water power and transmitting to Halifax via Dartmouth and Bedford for manufacturing and other purposes.

James D. Schuyler, of Los Angeles, has advised the British Columbia Electric Railway Company to undertake at the mouth of Lake Coquitlam the construction of a dam 75 feet high. This will create a greatly increased supply, which will flow through the hydraulic tunnel to Lake Buntzen, there being delivered to the pipes which carry it to the generating station on the North Arm of the inlet. This scheme is now being laid before the Provincial Government.

The wheels for the municipal power house at Bobcaygeon have arrived. The wheels, which were manufactured by the Madison Williams Foundry Co., Lindsay, are of the Triumph turbine type, and each is capable of developing 80 horse-power with a five-foot head, and about 100 horse-power with a six-foot head, the two weighing over fourteen tons. The dynamo and other apparatus has already been transferred to the new power house and the poles have been changed, so that the wheels and line shaft are now the only things to be fixed.

The Ontario Power Company are preparing plans for the construction of a new pipe line to increase their capacity of electric power by 65,000 horse power, and work will be commenced early in the spring. The work is made necessary to handle the contract with the Hydro Electric Commission. The tunnel will be of steel, lined with concrete, and will be 30 feet in diameter and about a mile in length. The work will cost over three quarters of a million dollars. With the new line the company will be able to develop 180,000 horse-power.

A year ago the ratepayers of London voted the sum of $235,000 for the purpose of establishing a distributing plant for Niagara power, but as yet no steps have been taken looking to construction of the service. As, however, it is promised that the power will be delivered at the city's gates by December next and London has contracted for 5,000 horse power per day, it is thought to be time the aldermen were doing something. The London Electric Company is willing to sell to the city, and the aldermen will ascertain what the London Electric is willing to sell for.

The special committee of the Montreal city council, which has been investigating the matter, has recommended that the city purchase the Water & Power Company. The latter want four and a half millions for their property, but the price will be fixed by arbitration. Speaking of the action of the council in notifying the Light, Heat & Power Company to continue the lighting of the streets, and that the city would be responsible for the cost, Mayor Payette said, "Council has pursued the proper course in this connection. The next move council must make is to decide what will be the future policy for the lighting of the streets. He advocates a municipal plant.

A big power scheme is now being considered by Edmonton. It is proposed to use the water power at Grand Rapids on the Athabasca river, 156 miles northwest of the city, to generate electricity for the use of the city. At Grand Rapids there is a fall in the water of 140 feet

in a distance of 600 feet. Here could be obtained electric power to the extent of 250,000 horse-power, which would meet the needs of Edmonton, Strathcona, Fort Saskatchewan, Leduc, Wetaskiwin and other towns. At the present time the above mentioned towns use 15,000 horse-power. It is estimated that it would cost $1,500 a mile to build a conducting line for the 150 miles.

The chief engineers of the Public Works, Marine and Canals Departments, who were asked by the Government to report on the project of an American company to develop power on the St. Lawrence river, near Cornwall, by damming the Long Sault Rapids, have reported that the plans as submitted by the company would need considerable modification before they could be entertained by the Canadian Government. The report states that the privileges asked for should not be granted unless it is made absolutely sure that the project will involve no interference with navigation, and the present canal system. The company have secured rights on the New York side of the river.

The Stave Lake Power Company, Vancouver, has been carrying on extensive operations at Stave lake at an expenditure of $400,000 to $500,000. Active construction had gone on up to the last half year and since then the management has been completing financial arrangements and making surveys for power lines into Vancouver. The route of the power line has been determined and the company holds a franchise which will enable it to supply power to industries all around Vancouver at a cheap rate, which will also apply to domestic and public power. The idea of associating with the Burrard, Westminster, Boundary road and V. W. & Y. is to utilize the charters held by these corporations to build lines into the adjacent municipalities.

In a score of municipalities in Ontario on election day by-laws were voted upon in connection with the Ontario Government power scheme. In all but two places—Brantford and Kingsville—the verdict of the ratepayers was favorable, which means that the scheme of Hon. Adam Beck will have to be extended and the operation of the Hydro-Electric Commission enlarged as far as Detroit and the St. Clair river. The work of the Niagara Falls Power Commission is evidently appreciated by the people. The places in which the by-law carried are: Amherstburg, Bothwell, Chatham, Comber, Dresden, Dundas, Elmira, Essex, Glencoe, Leamington, Norwich, Port Stanley, Ridgetown, Sandwich, Simcoe, Stratford, Tilbury, Tillsonburg, Walkerville, West Lorne, Windsor.

A. G. Perry, manager of the B. C. Electric Railway Co., has outlined the plans of his company in regard to the efforts to be made to avoid trouble in the future at Vancouver. The plans call for the erection of stronger masts at the Second Narrows and the staying of these masts by double steel guys; the strengthening of the piles around the masts and the general fixing of the lines across the Narrows. The company intends to rebuild the transmission lines in the municipality, carrying them up Lynn creek instead of across the creek, thus avoiding the danger of the poles across the creek being washed away again. This work will be started within a month and rushed to completion. New transformers will be installed in the sub-station, and also a new transformer giving double power to the street lighting system.

Negotiations between Winnipeg and the street railway came to an abrupt and somewhat unsatisfactory ending. Mr. Mann presented the final offering of the company regarding prices for power and commercial lighting, and his alternative for the sale of the enterprises to the city on a basis to be fixed by arbitration, but the council decided to reject these and proceed at once with the erection of a civic power plant on the Winnipeg river. Council, however, declared its readiness to treat with the company as to a basis on which an actual purchase may be effected. Included with the offer of a supply of electric energy for manufacturing purposes, the company declared its readiness to cut rates for commercial lighting 20 per cent., provided a contract for ten years was entered into and work on the municipal plant was deferred.

The construction of the Ontario Hydro-Electric line will be started as soon as the weather permits, according to F. H. McGuigan, the contractor, if material is in readiness. Three-quarters of the right-of-way to the west has been secured, and the laying of the footings will commence in March. Some five miles of footings, each sixteen feet square, will be laid prior to putting up the first towers. The route is highly satisfactory to the contractor. "With the exception of the valley between Waterdown and Dundas," said Mr. McGuigan, "it would be difficult to find better country anywhere for our purpose." The Hydro-Electric Commission visited Walkerville to inspect the sample towers for use on the power transmission line which are being manufactured at the border town. The towers are 60 feet high and built to stand the severest weather tests.

Structural Steel.

Saskatoon and the Canadian Northern Railway will build a foot bridge over the tracks on 20th Street.

The Canada Foundry Co., Toronto, recently received a contract for some bridges on the G. T.P. in New Brunswick.

The ratepayers of Toronto have carried a by-law to provide $250,000 for the construction of the Wilton Avenue bridge.

The Strathcona city council have instructed City Engineer McLean to prepare plans for a high level bridge over Mill Creek.

The excavation of the new G.T.P. elevator at Fort William is well under way and plans for structure are in preparation. The Canadian Bridge Co., Walkerville, which has the steel contract, is ready to begin its part of the work when the spring opens.

The Fort Erie and Buffalo Bridge Company is applying at the coming session of Parliament for an act of incorporation and for authority to construct a general traffic bridge across the Niagara River from the village of Fort Erie to the foot of Ferry Street in the City of Buffalo.

Park Commissioner Wilson recommends the construction of a bridge at the Island to connect Centre Island and Hanlan's Point, Toronto. The commissioner proposes building this of steel or concrete. The structure will have to be built at a great height in order to admit of the fire tug getting up the lagoon. The Park Commissioner also contemplates the construction of half a dozen other bridges across the various lagoons.

Navigation of the North Saskatchewan at Saskatoon, which is yearly increasing, already demands recognition. This is given in the swing span composing the middle of the bridge. Three spans on either end and a huge swing covering two spans and controlled by hydraulic power, will measure the bridge's length when complete. Its width will accommodate a single line of rails in the middle with a 12-foot driveway for foot passengers and vehicular traffic on either side. The work is being done and the material supplied by the Hamilton Bridge Company, who are rushing construction. The three south spans are nearly completed, and piling is driven for the temporary structure in the centre to carry materials and machinery across for building the three north spans. The swing will be the last constructed.

The agreement just entered into with the C. P.R. by Fort William for further exemption for taxation will involve a large expenditure in the city by the company, and will mean an immense amount of structural steel being used here in the next few months. Under this agreement the company will pay $30,000 per year into the city treasury for the next fifteen years and will build two steel swing bridges, one across the Kaministikwia river, and one across the McKellar river, at an estimated cost of $700,000, these two to be completed in eighteen months. In addition to this the railway company has acquired over 300 acres of land upon the islands at the mouth of the river, to which these bridges will give access and they purpose erecting an immense coal handling plant there which will employ a large number of men, both in construction and operation.

Planing Mill News.

The box factory at Rodney, Ont., is shortly to be enlarged.

Jas. Cameron has put up a shingle mill at Fallbrook, Ont.

Carnegie Milling Co. are building a sawmill at Port Perry, Ont.

McArthur's sawmill at Murillo, Ont., was recently damaged by fire.

Dr. D. R. Moore, of Stanley, N.B., has erected a new hardwood mill at that place.

Batt's, Ltd., have just completed a large addition to their planing mill at West Toronto.

The North American Bent Chair Company are making extensive additions to their buildings in Owen Sound.

The Eelkirk Match Company, Ltd., Selkirk, Man., have obtained a charter. The concern is capitalized at $40,000.

The Moose River Lumber Co.'s sawmill at Parrsboro, N.S., has been burned at a heavy loss. It was not insured.

The lumber sheds, store and office of the William Cowan Company, Prince Albert, Sask., were destroyed by fire recently.

M. J. O'Brien, of Renfrew, Ont., has formed a stock company to take over the sawmill business of J. D. McRae at Eganville, Ont.

The Evans Company, Limited, have almost completed the erection of a planing mill and sash and door factory in Sudbury, Ont.

A Vancouver despatch states that the log market on Puget Sound is in an unprecedented condition, as every boom of logs has been sold.

A Shelburne, N.S., despatch says that it is expected that the Lewis Miller Company will build a large lumber mill at Jordan Falls this year.

The Wash Sash & Door Company, of New Westminster, B.C., recently reported running time and a quarter, or twelve and a half hours per day.

Mayor Evans, of Winnipeg, proposes that the city should open a lumber camp at the city's limits, at Lac du Bois, for the relief of the unemployed.

P. Kyle is rebuilding his sawmill at Merrickville, Ont., which was destroyed by fire last summer. It will be operated by J. Bigford and John Wilson as a custom sawmill.

Owing to the demand for their goods, the Wash Sash and Door Company, of New Westminster, B.C., are running time and a quarter, or twelve and a half hours per day.

The Royal Planing Mills on False Creek, Vancouver, have been burned with a loss of $100,000. About 250,000 feet of lumber were destroyed. Part of the sawmill and dry kilns were saved.

Recent Vancouver incorporations include: P. D. Hillis Logging Company, capital, $100,000; Glen Valley Logging Company, capital, $25,000; and Robinson & Lequime Lumber Company, capital, $15,000.

John McGrath, Peterboro, Ont., is erecting a sawmill at Lakefield. The machinery has been bought, and it is expected that the mill will be ready for operation, with a daily capacity of 15,000 feet, this month.

The Welland Vale Manufacturing Company's premises at St. Catharines, Ont., including a large stock of hoe, rake, spade and other handles, were destroyed by fire. Loss, $50,000, mostly covered by insurance.

Seaton Bros., boat builders, New Westminster, B.C., have purchased the Crane yards and will immediately carry out improvements. It is proposed to open a machine shop, wood working plant and, later on, a steel forging plant.

The Sanderson-Harold Screen Works, at Paris, Ont., have been destroyed by fire, with a damage of $50,000. The firm made chiefly screen doors, refrigerators, etc. Over a hundred men are employed. The factory will be rebuilt at once.

Delahey Bros., of Pembroke, Ont., proprietors of the National Manufacturing Company, which was recently burned out, have taken over the plant of the Cossitt Company, makers of agricultural implements, Brockville, and will made large extensions to the factory.

The Fernie Lumber Company's new mill to replace the one destroyed in the recent conflagration, is now in operation, and is cutting and shipping lumber. The entire plant is not yet completed. It will subsequently have a capacity of between 50,000 and 60,000 feet per day.

A. H. Vanwart, Fredericton, N.B., has purchased the sawmill of R. Kirkpatrick at Debec Junction. In the spring the machinery will be brought to Fredericton and will be placed in a new structure to be built by Mr. Vanwart. The mill is fitted with rotary, planer, lath and shingle machines.

A. F. Johnson, 703 North Main Street, Paris, Texas, proposes to establish a factory in western Canada for the production of shovel handles, and is enquiring where there is a supply of white or grey ash timber, which is growing scarce in the United States, and is the only timber that can be used in the manufacture of shovel handles.

The car building firm of Rhodes, Curry & Company, of Amherst, N.S., are buying large quantities of quartered oak lumber for interior finish from the Virginia mills and are shipping this lumber by sea to Halifax. This oak is being used entirely for the finish in the new cars which are being built by the company for the Grand Trunk Pacific Railroad of Canada. The company heretofore have bought all their oak in the New England States.

The old Scott Planing Mill, Galt, which recently was taken over by Hart & Carlaw, contractors and builders, is being equipped with modern new machinery, from the Cowan & Co. shops. At the present time one of the largest-size moulders manufactured by Cowan & Co. is being installed, and other machines from the same shops will shortly follow, the object of the firm being to fit the mill with the very best wood working devices known to the maker of building material.

The St. John River Log Driving Company, Fredericton, N.B., suffered serious loss from the recent floods. The company's sheer booms from

Crock's Point, 10,000 feet in length, were stored in the Nashwaaksis river as usual for many years, and the ice on this river breaking up, the booms were destroyed, a quantity of machinery, which had only been in operation a few days. Among the great timbers of which they were composed snapping like matches. Lewis H. Bliss, manager of the company, estimates that it will require at least $20,000 to replace the booms, which must be done before the ice breaks up next spring.

A Vancouver despatch says that Portland, Oregon, sawmills have been beaten out of a first instalment sale of 400,000 feet of lumber to the Government by Seattle dealers, who will deliver the material in that city from British Columbia and pay the $2 per thousand duty on it. The lumber is Douglas fir, intended for the Panama Canal, and is to be loaded on a transport at Seattle to be landed at the western terminus of the canal. Arthur Camwell, who got the contract, is an exporter of lumber from Vancouver Island. The average bid of Oregon firms was $10 a thousand, and as the foreign manufacturer has to pay the $2 duty on unloading the lumber in the canal zone, he will really sell the material at $8 a thousand or less.

Trade Notes.

The Sydney Foundry Company is instaling a modern steam heating system in the Jubilee Methodist church at Sydney.

Decatur, Bull & Co., Montreal, have arranged to handle the different lines made by the Erie Iron Works, St. Thomas.

The Canada Iron Corporation, Fort William, was awarded a contract for 12,300 feet of 18-inch water main for that town.

The Northern Engineering Works, Detroit, have furnished one of their No. 42 Newten cupolas to Cadillac Machine Co., Cadillac, Mich.

C. H. Rust, Toronto's city engineer, states that contracts for two and a half miles of iron pipes have been awarded to the Canada Foundry Company.

The Ottawa Car Company has received an order from the Halifax Street Railway for two pay as you enter cars, similar in style to those in use by the Ottawa Electric Railway.

The Detroit Foundry Supply Co. have placed their second cupola in Hamilton. They are now instaling a Crandall No. 2 cupola for small heats in the Gurney Tilden foundry.

The main switchboard, distributing boards and cabinets for the new drill hall at Sherbrooke, Que., are being supplied by the Hill Electric Mfg. Co., 1560 St. Lawrence Street, Montreal.

William Abbott, 334 St. James St., Montreal, has been appointed sole agent for Canada for the Cyclone High Speed Chain hoist. The hoists are made in several sizes suitable for machine shops, mines, etc.

The Laurie Engine and Machine Company, Montreal, have acquired the sole rights to manufacture and sell in Canada, the pulp grinders and wet machines of the Dilks Machine Works, Fulton, N.Y.

The Western Engineering Company has been incorporated with a capital of $100,000. General engineering and contracting work will be carried on. The situation of the head office will probably be in Montreal.

The Canadian Crown Castings Company has been incorporated with a capital of $39,000. They will carry on the business of making cars and rolling stock and general manufacturing pertaining to the same. The plant will, in all probability be in the vicinity of Montreal.

The Hamilton Bridge Works Company has been incorporated with a capital stock of $1,600,000. The incorporators are, Hon. John S. Hendrie, C.V.O.; William Hendrie and Walter B. Champ, of Hamilton; George M. Hendrie, of Windsor, and A. D. Braithwaite, of Toronto.

McKinnon Dash & Metal Works Co., St. Catharines, have started the manufacture of coil chain. The chains are electrically welded automatically and cold formed automatically. McKinnon Dash & Metal Works Co. control the patents of the world for the manufacture of this style of chain.

The patent rights to make and sell the Wing turbine blower in Canada have been granted the Laurie Engine & Machine Company, Montreal. This blower is a combination of a disc fan and turbine engine and the exhaust enters the furnace with the air, heating it and economizing fuel in this way.

The Temiskaming and Northern Ontario Railway Commission on January 15 awarded the contract for the building of two new switching engines for the Government road in the Kingston Locomotive Works, providing this company signs the necessary contract. There were three tenders for the contract.

At the annual meeting of the Independent Pneumatic Tool Co., Chicago, held at Jersey City, it was shown that export trade and business in the United States were improving and that prospects for 1909 were excellent. This company manufactures Thor pneumatic tools, including hammers, drills, saws, motors, etc.

The annual meeting of the salesmen of the Canadian Westinghouse, Hamilton, was held recently, when the salesmen from the various district offices from Halifax to Vancouver attended. The condition of business, and suggestions of mutual benefit were discussed and plans made for the present year. The concensus of opinion of the salesmen with regard to the business outlook was of a most optimistic character.

The Smart-Turner Machine Co., 191 Barton St., Hamilton, have recently supplied pumps to A. R. Williams Machinery Co., Toronto; Canadian Axminster Carpet Co., Hamilton; Canadian Towing & Wrecking Co., Port Arthur; E. Long Mfg. Co., Orillia; Ayr Electric Light Co., and a side suction centrifugal pump direct connected to a motor, to the Coniagas Mines, Cobalt. They have also supplied the Canada Screw Co., Hamilton, with a tumbling barrel, and M. F. Beach, Iroquois, Ont., with an 8 ton hand-power traveling crane.

Building Operations.

F. J. Rank, whose flour mill was destroyed at Norwich, will rebuild.

It is stated that a New York syndicate will erect a $200,000 sanitarium at Watrous, Sask.

Vancouver will have new stations erected by the Great Northern and Northern Pacific Railways.

The Western Milling Co.'s elevator at Calgary, burned at a loss of $50,000, will be rebuilt.

The electric light plant and Walsh's roller mill, Ormstown, Que., were recently destroyed by fire.

Andrew Mellquham is erecting a glue factory at Kingston. The building will be completed in June.

The Barnett, McQueen Co. has the contract for building the 1,000,000 bushel elevator at Port Arthur.

The B.C. Government will shortly let tenders for the new Central Insane Asylum building at New Westminster.

The total value of building permits in Toronto for 1908 was $12,447,467, as compared with $14,225,800 during 1907.

The School of Mining, Kingston, will ask the Provincial Government to erect a building for mining and mineralogy.

The building permits in Stratford during the past year totalled $136,545, as compared with $641,485 of the year previous.

It is probable that the C.P.R. will let the contract for the 2,000,000 bushel elevator at Victoria Harbor in a month's time.

The Harold Sanderson refrigerator factory, burned at Paris on Christmas day, will be rebuilt on a larger scale at that place.

Alberta, Saskatchewan and Manitoba are said to have agreed to build and equip a number of publicly owned grain elevators in the West.

The International Heating and Lighting Co., Cleveland, have been granted an extension of time in which to commence operations in Edmonton.

The number of building permits issued in Montreal during 1908 was 1,283, and the aggregate value $4,317,753, which was $3,343,863 behind the previous year.

It is understood that a new wing will shortly be built to the Ontario Legislative buildings In it will be located the library, archives, patent surveys department, etc.

Victoria, B.C., issued building permits to the extent of $1,121,146 during 1908. In the last fifteen years new structures have been erected in Victoria to the value of nearly $9,000,000.

The Hamilton Technical School building is nearing completion. The laboratories will be fully equipped for illustrating the work to be taught. The school will be ready to begin complete courses in September.

The plans have been accepted of Warren H. Milner, Seattle, for the large building for the Vancouver Horse Show Association. The estimates call for a construction to cost $80,000, but it is said that the cost will be closer on to $50,000. The building will be erected without delay at the corner of Georgia and Gilford Streets.

General Manufacturing Notes.

The Collingwood Shipbuilding Co. intend to greatly enlarge its plant at that place.

The Toronto Railway Co. will build new car barns to accommodate a hundred cars.

The plant of the Western Ontario Portland Cement Co., Attwood, Ont., will be sold.

Shurley & Dietrich's saw factory, Galt, is filled with orders and a large staff is working ten hours a day.

Toronto and Philadelphia capitalists are reported as going to build a shipyard and drydock at Sandwich.

Work on the new Thunder Bay elevator at Port Arthur has commenced and a great many men are employed.

Robert Richardi, of Arnprior, is negotiating with Fredericton for the establishment of a clothes-pin factory in that city.

A. W. Moore and A. D. Cooper are instaling at Alberni, B.C., a brick-making plant, so as to be ready for the spring building operations.

The Hamilton Steel & Iron Co., Hamilton, are planning to instal Gayley's dry air blast system in connection with their blast furnaces.

The Trinidad Telephone Co. is a new concern which intends to manufacture telephones and electrical instruments and appliances at Halifax.

The Down Draft Furnace Co., Galt, are working full time, and salesmen report a good demand for this firm's ranges, stoves and furnaces.

Sheldon's bed factory, Galt, during the past year was never on short time, and the prospects at present are better than ever before in the history of the firm.

A company of U.S. men propose drilling for gas in the vicinity of Peterboro and wish to get a franchise from that city and from Lindsay for the supply of same.

The Murray Shoe Company is about to erect a new factory on Richmond Street, London. It will be three storeys high and 50x300 feet. The new premises will accommodate 150 hands.

Milton property owners carried a by-law to guarantee the bonds of the P. L. Robertson Manufacturing Co., screw manufacturers, $10,000 for ten years, and pay the interest thereon.

The first traction gas engine ever built in Canada has been turned out at the Goold, Shapley & Muir factory, Brantford. It was built as an experiment which has resulted successfully.

The Weiland Vale Manufacturing Co.'s premises at St. Catharines, Ont., including a large stock of hoe, rake, spade and other handles, were destroyed by fire. Loss, $50,000, mostly covered by insurance.

Niagara Falls centre will have a new factory erected by Brooklyn capitalists to manufacture boxes and other products from corrugated paper. A site has been selected and 200 hands will be given employment.

The Canadian Flax Mills Company is a new concern which has located in Chatham, with factory on Thames Street From 12 to 15 men will be employed during the winter, and a new building will be erected in the spring.

Among other industries which are likely to materialize at Fort William this year is a shipbuilding yard and graving dock, which will also be located upon one of the two islands in the delta of the Kaministikwia river.

Fire destroyed the Globe Casket Company's factory at London on Jan. 18. The building was practically destroyed The plant was valued at $150,000 The building and contents are an entire loss The company may rebuild at Toronto.

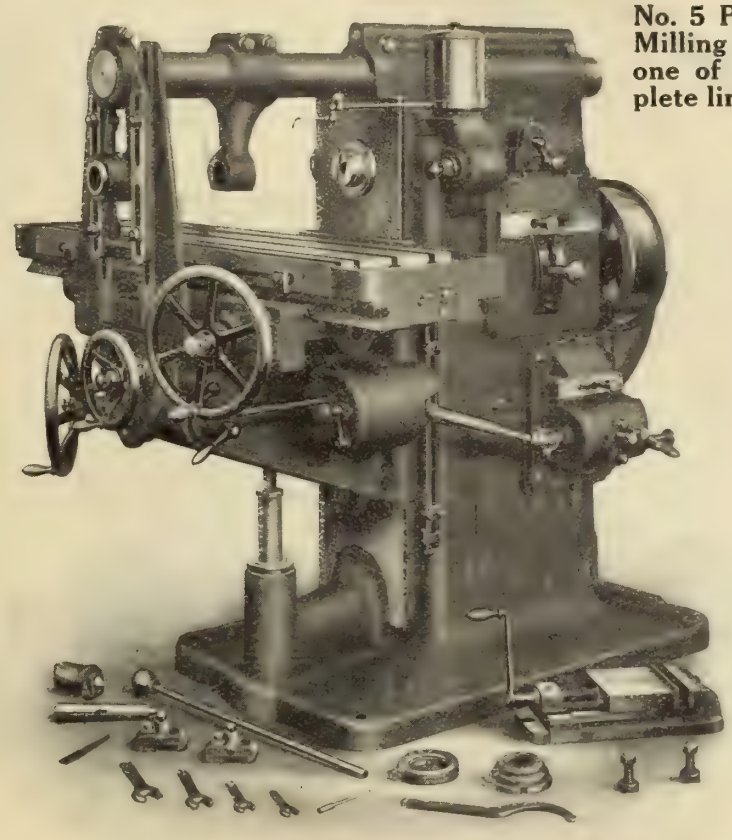
The selling staff of the Pease Foundry Co., Toronto, were the guests of the officers of the company at a dinner on December 31 The day was spent in a staff conference, during which a discussion took place on the new features to be added to the Pease line of heating goods, as well as on the plans for a further extension of the company's business.

The Colonial Portland Cement Co., Wiarton, has assigned, and a winding up order has been granted The company has a splendid plant and owns a marl bed about a mile from the works and has a private railway connecting them, while the clay was brought down by scow from Griffiths Island It is expected that the company will resume business in the spring.

The by-law for a bonus of $10,000 to the Warmouth Piano Co., to re-establish their factory, and which was defeated election day, will be submitted to the people again on February 4 The council agreed to this, and the Board of Trade is putting forth every effort possible to have the by-law passed this time It was defeated by 17 votes last time Other cities are anxious for the works, and have made tempting offers.

BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.



No. 5 Plain Milling Machine, one of the complete line.

THE ORIGINAL

Constant Speed Drive Milling Machine

Was a **B. & S.**, designed in 1900, run in our shops three years, and appeared in our catalogue of 1904.

It Was Designed for Heavy Service

And judging from the work it has done in this shop and others it is daily proving itself capable of **heavy service.**

Men in Charge

—Owners —Superintendents
—Managers —Foremen
—Purchasing Agents

¶ Ah! These are the men you want to reach with your advertising.

¶ There is a reason why CANADIAN MACHINERY AND MANUFACTURING NEWS is THE medium you should use in a large way to reach these men.

¶ Given a good journal,—well edited, illustrated and well printed, the paid-up circulation would be small were not a vigorous campaign carried on, both by mail and personal work.

¶ CANADIAN MACHINERY is well edited, well illustrated and well printed—the one source in Canada of timely, reliable, first-hand information to mechanical men.

¶ But we are not satisfied with simply publishing a good journal. Eight thoroughly-trained, salaried subscription men are out hustling for subscriptions—and getting the business, or we want to know the reason why. In addition, we are represented in practically every railroad shop and other large shops by special agents, who are well paid for every order sent in—and every mail brings orders from these men.

¶ No machine shop, foundry or metal working shop of any class, whether large or small, is overlooked by our subscription plan.

¶ Above is one GOOD reason why you should not overlook this journal as your strongest aid to more business in 1909. There are many others.

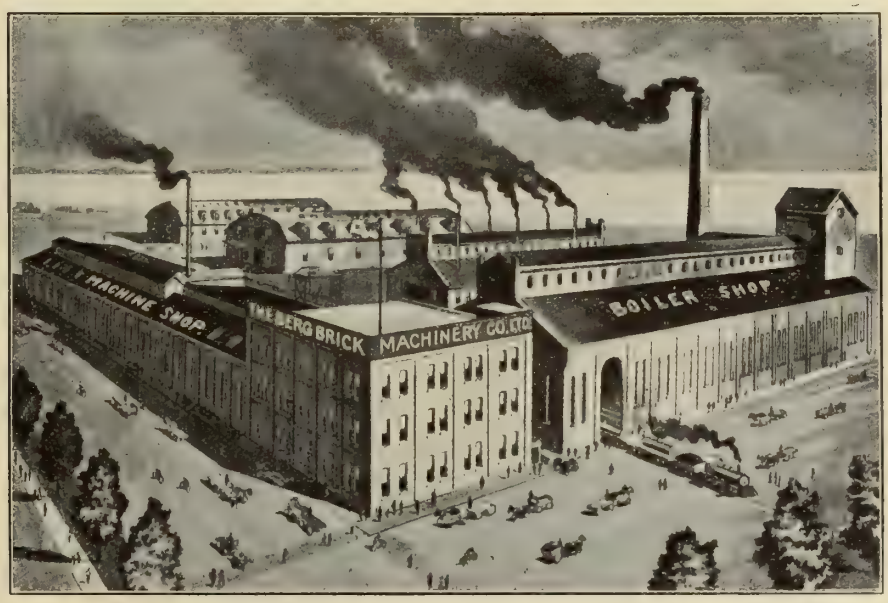
Want to talk it over? Write us.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

10 Front St. East, Toronto

Whenever you want any HEAVY MACHINERY

manufactured in any quantity write us with specifications and get our estimate. It will pay you to do so because we have a plant and equipment unequalled in Canada. We guarantee thoroughly satisfactory work at the most reasonable prices.



The plant shown in the above picture includes a complete modern Machine Shop, Foundry, Boiler Shop, Blacksmith Shop, Pattern Shop, Pattern Storage Facilities, etc., which are always at your service. Write us about your requirements.

New Companies.

Electric Railway Supplies, Toronto; capital, $40,000; to manufacture railway supplies. Incorporators, S. Johnston, W. N. Tilley, A. J. Thomson, all of Toronto.

Canada Fertilizer Co., Montreal; capital, $175,000; to manufacture and deal in fertilizers. Incorporators, E. M. Sliney, B. Stevens, R. E. Wagaman, all of Montreal.

Ontario Metal Culvert Co., Guelph; capital, $55,000; to make metal culverts and galvanized products. Incorporators, R. W. Gladstone, D. Gladstone and H. B. Sharman, all of Guelph.

Rosedale Sawmill Co., Toronto; capital, $40,000. Among the incorporators are T. H. Hancock, F. H. Hurlburt, Mary E. Hurlburt, Marion V. Hancock and E. Gunn, all of Toronto.

The Martin Pump and Machinery Co., Toronto; capital, $40,000; to manufacture and deal in machinery. Provisional directors, T. H. Martin, James Martin and Mary M. Thompson, all of Toronto.

The Frankford Cooperage Co., Frankford, Ont.; capital, $40,000; to carry on general cooperage business. Provisional directors, G. B. Mott, Frankford; Grace E. Graham and H. W. Ackerman, Belleville.

McIntyre & Taylor, Toronto; capital, $20,000; to manufacture and deal in merchandise composed of wood, cement, oils, metals, etc. Incorporators, E. C. Ironside, H. Riley, R. R. Perry, all of Toronto.

The Newfoundland Marble Co., Toronto; capital, $100,000; to crush and treat ores, metals and minerals. Provisional directors, D. T. McIntosh, A. Dods, G. Grant, Fred Grundy and A. N. Morine, all of Toronto.

H. J. Wood, Limited, Toronto; capital, $60,000; to manufacture wood and metal goods. Among the incorporators are D. J. Procton, C. Nostrant, B. E. Pewtress, E. C. Ironside and H. Riley, all of Toronto.

Modern Agency Supply and Construction Co., Ottawa; capital, $10,000; to conduct general contracting business. Incorporators, F. X. Talbot, R. Belanger, A. Belanger, C. Perron and J. Labelle, all of Ottawa.

The National Metal Ware Co., Hamilton; capital, $40,000; to manufacture and deal in wood, paper, iron and metal ware. Among the incorporators are O. D. Peat, H. S. Lees, L. F. Stephens, T. Hobson and J. Hobson, all of Hamilton.

Canadian Railway Equipment Co., Toronto; capital, $200,000; to manufacture cars, wheels and trucks. Among the incorporators are A. W. Holmsteed, F. H. Potts, A. R. Bickerstaff, T. A. Silverthorn and Edith M. Carruthers, all of Toronto.

The Provincial Steel Co., Cobourg; capital, $250,000; to manufacture steel and iron articles. Among the incorporators are R. Heath, Didulph Grange, England; F. W. Coolbaugh, of Philadelphia, and Beattie N. MacNachtan and W. L. Allen, of Cobourg.

The Berlin Central Heating Co., Berlin; capital, $80,000; to construct and operate works for production of steam, hot air or hot water, for power and heating purposes; also to distribute natural gas. Incorporators, J. D. Moore, P. S. Lautenschlager, C. H. Doerr, all of Berlin.

The Canadian Potato Machinery Company, Ottawa; capital, $25,000. Those incorporated are Otto and Leonard Knoerzer, Hammond, Ind., U.S., and W. H. Schreiber, William Morris and Jason Routh, Ottawa. The company is empowered to manufacture all kinds of machinery.

The Hamilton Bridge Works Company has been incorporated with a capital stock of one million dollars. The incorporators are, Hon. J. S. Hendrie, C.V.O.; William Hendrie, and Walter B. Champ, of Hamilton; George M. Hendrie of Windsor, and A. D. Braithwaite, of Toronto.

Forwell Foundry, Limited, Berlin; capital, $50,000; to take over the Forwell Foundry Co., and manufacture machinery and plumbers', gasfitters' and steamfitters' supplies. Among the incorporators are W. Forwell and Ira S. K. Weber, Berlin; and A. W. Groff, H. J. Liphardt and C. Liphardt, of Waterloo.

Calendars.

We have received calendars for 1909 from B. Greening Wire Co., Hamilton; Albany & North River Molding Sand Co., Albany, N.Y.; Toronto Bolting & Forging Co., Toronto; City of Winnipeg; C. A. Vandewell Co., London, Eng. In all the numbers are large and any one of them will be found useful in an office.

New Silica Discovery.

Leamington is to have a glass factory. This announcement comes as the result of the recent discovery of large deposits of pure silica near Amherstburg. A company is being formed to build a factory in Leamington, the concern going to that town on account of the fact that the Heinz pickling factory there will be a good customer, in addition to which the town has a supply of natural gas.

Sewer Pipe Industry Needed.

That a valuable deposit of material suitable for the manufacture of high grade sewer pipe which is in such great demand all over this western country at Prince Albert, and waiting the machinery and capital for the development of an extensive and profitable industry with practically unlimited market. John Merchant, of the Celtic Brick Works, Prince Albert, has had the clay tested at Mimico, Ont., and the clay makes excellent sewer pipe.

B. C. Turpentine Industry.

The utilization of tree tops, stumps, etc., is the object of a new concern to be established in Chilliwack, B.C., to use this refuse in the manufacture of charcoal, tar, turpentine, creosote, etc. It will be known as the Canada Chemical and Wood Distilling Company. One hundred and thirty acres of land with timber on it have been secured. The capitalization will be $25,000 and arrangements are being made for an early start in the erection of a building and the instalation of machinery.

Cobourg's New Industry.

The Provincial Steel Co., which was chartered a fortnight ago, with headquarters at Cobourg, will take up the re-rolling of steel rails, which have become worn and run over at the edges, after having been used on the main lines where traffic is heavy. After being re-rolled at Cobourg the rails will be used for sidings where a slightly lighter rail can be used than on the main line. It is claimed that owing to the establishment of the G.T.R. ferry, operating throughout the year, coal can be laid down at 80c per ton cheaper than any other point in Ontario.

Joy Range Plant Sold.

Tht Canadian Heating & Ventilating Co., of Owen Sound, have purchased the plant and business of the Joy Manufacturing Co., Toronto. The Joy Co., which has been making malleable ranges for about four years, has been taken over as a going concern, and the plant will be moved to Owen Sound and the business amalgamated with the Canadian Heating and Ventilating Co.

J. R. Joy, who has been superintendent of the Toronto plant, will move to Owen Sound and continue to supervise the manufacture of the Joy malleable ranges. H. N. Joy, manager of the company, is retiring and will devote his activities to other interests.

Twentieth Anniversary of Mechanics' Supply Co.

On Jan. 4, W. H. Wiggs, assisted by the manager and heads of departments, held a reception to celebrate the 20th anniversary of the Mechanics' Supply Co. During the afternoon an orchestra rendered musical selections and refreshments were served. The guests were conducted through the different departments by the members of the staff, who pointed out the utility of the different articles.

After the reception the members of the staff were entertained at dinner by Mr. Wiggs, when a brief toast list brought forth some reminiscences from Mr. Wiggs of his long connection with the mechanics' supply business. There were speeches by the heads of the departments and at the conclusion Mr. Wiggs showed some splendid lantern travel views.

New Montreal Machinery Co.

One of the most recent machinery companies to be formed in eastern Canada is the Rudel-Yeates Machinery Co., Canadian Express building, McGill Street, Montreal. Both C. M. Rudel and Roland Yeates are well known to the machinery trade, Mr. Rudel having been formerly manager of the Canadian Fairbanks Company in Montreal, and Mr. Yeates the eastern representative of the London Machine Tool Co., Hamilton.

They will handle a complete line of metal and wood working machinery, transmission machinery, railroad contractors, mill, mine and factory supplies.

Among the lines appear the products of the London Machine Tool Co., the hand and electric traveling cranes of the Dominion Bridge Co., the double roller bearings of the Chapman Roller Bearing Co., besides a number of other well-known Canadian and American lines.

Big B. C. Oil Refinery.

The establishment at Port Moody, B. C., in the near future of an oil refinery will be the beginning of an industry that promises to assume large proportions. The directorate is composed of Col. T. H. Tracy, civil engineer, formerly city engineer of Vancouver; Robert Kelly, Major J. Duff Stuart, A. M. Tyson, Hugh McLean, all of Vancouver, and Fred L. McLean, president of the Keystone Oil Co., Seattle. The promotion of the company is being attended to by Leon Melekoy. The C.P.R. has leased the company the whole of its old terminus holdings at Port Moody on nominal terms. It is proposed to bring the crude oil in tank boats, delivery not less than eight times a year. The crude product is admitted free, while refined oils pay duties varying from 12½ to 25 per cent. It is stated that this will be a direct parallel to the B. C. Sugar Refinery, except that there will be less opposition. In addition, the company has secured the business of the Keystone Oil Company in British Columbia, which includes 12 contracts for a year's supply of asphalt at $18.50 per ton. The outlook is very encouraging as last year 6,000 tons of asphalt were used in British Columbia, and 60,000 tons were imported in Canada from the United States. There will also be markets in the Orient and the Antipodes.

Smelting by Electricity.

The first electric smelter for the treatment of zinc to be established on the continent has been started at Nelson, B.C., the initial operation proving a success. It has been in construction for the past year, but is now producing spelter and lead, silver bullion from mixed zinc-lead ores. Frederick T. Snyder, of Chicago, is the inventor of the process, while the manager of the Canada Zinc Company is Robt. Irving, a number of local men being interested. The plant represents the expenditure of about $125,000, and five years of experimental work in the development of the method. Owing to the great value of the system in enabling ores to be worked that would not otherwise pay a profit, the Provincial Government has assisted the enterprise to the extent of $20,000, and the result is already apparent in the increase in the values of the properties carrying mixed ores of zinc. This new plant also saves the copper in the ore as a copper matte and is a departure in the smelting of ores in the use of a current of electricity in place of a blast. This enables the zinc to be saved in the smelting of any ore. In the blast furnace, the blast burns the zinc. The electricity is generated at Bonnington Falls, on the Kootenay, where there is an immense amount of power available.

Similar plants have been in operation in Sweden, where the treatment of ore by electricity has met with a high degree of success for about three years. A small experimental plant was established at Vancouver, but the plant at Nelson is the first to be established on a commercial basis. In Sweden conditions are extremely favorable to this method of treating ore, as electric power can be secured for $5 or $6 per h.p., while at Nelson the price of city power is $30. One of the problems which the promoters of the works here had to face was to reduce the cost of power, and to do this a system has been worked out by which only about half the power is required to operate as would be used in similar work in Sweden. The success of the Canada Zinc Company will revolutionize mining in British Columbia, in fact, one cannot realize just what it will mean to the vast number of low grade properties in this province.

Machinery Markets

MONTREAL.

The condition of the machinery market in this district at this time (January 25) is stationary. The majority of the year-end inventories have been taken and the books have been closed for the last two weeks. On that account orders are slow, as they always are at this time of year. Nevertheless, the indications for a good year are bright. The railways, always the pulse of the times, are beginning to place orders of no mean magnitude, for example, the Montreal Locomotive Works have received orders for thirty locomotives of the Pacific type for the C.P.R., and twenty-five engines for the G.T.P. This means the immediate employment of a thousand or more men and is bound to be felt in machinery circles. There are also a fairly large amount of specifications in the hands of machinery dealers and indications of more to follow, showing the business to be accelerating.

WINNIPEG
VANCOUVER

The condition of things in the wood-working machinery line is good, the demand showing tendency to increase rather than diminish.

The tool steel trade is still quiet, the reason being the fact that the inventories have only just been taken, but next month should show a decided activity in these lines, on account of replenishing of stocks, etc., that must assuredly take place.

The unsettled condition of the tariff on steel castings, according to some authorities, is having the effect of holding off large orders in these lines. Buyers are waiting to see which way the cat is going to jump; Canadian manufacturers will have to reduce prices to meet any reduction in the tariff and large buyers are holding off as long as possible pending this.

THE WEST.

The energy with which railway contracts are being pushed and the extensive preparations for next spring are all good and hopeful signs of the times. One of the surprises to people arriving in Winnipeg is the fact that during the very coldest days we have had this winter, the erection of the structural steel has proceeded steadily on the new Union Depot for the C.N.R. and G.T.P., several thousand tons having been put in place in the past two weeks. This is not the only building on which steel is being erected during the winter months, but it is the largest.

A real estate deal that carries with it much more than the mere transfer of a block of land at a good figure, is the purchase by the Canadian Pacific Railway just north of Portage Avenue on the spur track of the Great West Development Company on the western boundary of the city of a large block. This site has been secured by the railway for the purpose of erecting a sub-station for freight. The C.P.R. has bought the spur as well as the land along it, and this purchase and the erection of the freight sub-station is necessitated by the rapid development of manufacturing of various kinds in that part of the city. In addition to a number of factories already in the neighborhood several large industries have under consideration plans for the erection of buildings next spring. Four years ago this section of Winnipeg was open prairie, and now it needs a sub-station for freight. The matter needs no comment.

The turn of the year finds all branches of trade in the West cheerfully looking forward to a record year's business in 1909. The first six months of the year 1908 were rather disappointing, the next three showed some improvement, and the last three have seen a big impetus in all branches of trade. The big crop and the high price have been the commercial salvation of the West and business is once again assuming normal proportions. Money is circulating freely and the trade are beginning to order much more freely. As indicating the general business condition of the country, the manager of one of the big agricultural implement concerns stated recently that not in the last ten years have his collections throughout the West been so satisfactory as at present.

Mr. H. W. Petrie, president of H. W. Petrie, Toronto, Montreal and Vancouver, the well-known and old-established eastern firm of general machinists, is in Vancouver on a business trip. This company has been incorporated and has obtained a charter under the laws of British Columbia. Mr. Petrie has been so impressed with the situation in British Columbia that his company will carry in Vancouver large lines of machinery, including sawmill, shingle-mill, wood-working machinery, pumps, machine tools, etc.

The Victoria Machinery Depot are adding the newest and most up-to-date patterns of labor-saving machines to their plant to replace those destroyed by fire last year.

TORONTO.

With the placing of orders by the railroads for rolling stock dealers are very optimistic about 1909 business. The railroad shops are working at full pressure with thousands of mechanics in constant employment. This has created a feeling of buoyancy among the machine shop managers and orders which for some time could not be closed are now coming to a head. The Toronto houses report a great number of small orders. Though these are small they are in sufficient quantity to make quite a large total. Now that the railroads have started buying others will no doubt follow their lead.

There are quite a number of inquiries which will lead to business in time. Very few of these are from the promoters of the large new shops planned for western Ontario. When these start ordering it will stimulate business in the machine tool line. There are prospects of inquiries coming from this source at an early date and a number of fair-sized orders being placed.

The Hamilton Iron and Steel Co., who recently enlarged their plant, consisting of blast furnaces, rolling mills, etc., contemplate a still further enlargement. The London Machine Tool Co., Hamilton, are also making arrangements to build a large foundry this year.

The demand for machine steel has not yet resumed normal conditions, but there are a number of orders continually being placed. Present orders are for immediate shipment as manufacturers have very small stocks on hand. The demand will be more brisk from now on as manufacturers are doing sufficient business to warrant the carrying of a certain amount of stock.

CATALOGUES.

Publishers of these catalogues will send any reader copies by mailing them his name and address and mentioning Canadian Machinery.

CHUCKS—Pamphlet of lathe chucks from the Skinner Chuck Co., New Britain, Conn.

DIARY—For 1909, from the Albany & North River Molding Sand Co., Albany, N.Y.

DRILL—Circular describing fully the 24-in. drill of the Foote-Burt Co., Cleveland, Ohio.

FOUNDRY MACHINERY—Booklet from the Northern Engineering Works, Detroit, of cupolas, cranes, etc.

PORTABLE MOLD DRYER—Pamphlet from Hanna Engineering Works, 820 Elston Avenue, Chicago, of portable mold dryers.

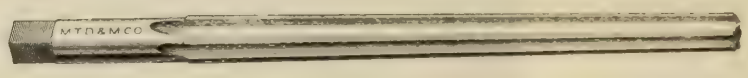
MULTIPLE MOLDING—Treatise issued by the Rathbone Molding Machine Co., 44 Buhl Block, Detroit, giving some of the advantages of multiple molding.

PRESSES—Catalogue No. 16 from Ferracute Machine Co., Bridgton, N.J., describing drop presses, power presses, toggle drawing press, coining presses, etc.

"MORSE"

TAPER PINS

A part of the success of motor car manufacturing lies in the accuracy of taper pins used in their construction. "MORSE" TAPER PINS are absolutely correct in regard to taper and size.



REAMERS

Drills, Reamers, Cutters, Chucks, Taps, Dies, Arbors, Counterbores, Countersinks, Gauges, Machines, Mandrels, Mills, Screw Plates, Sleeves, Sockets, Taper Pins.

"PEERLESS" High Speed REAMERS

The proof is in the Reaming.

have blades of specially selected high-speed steel, solidly joined to a soft steel body—can be run at double the speed of carbon steel reamers and will ream two or three times as many holes without grinding—cost you only half as much as other solid high speed reamers.

PROVE THESE STATEMENTS !

CATALOG No. 35-c

The CLEVELAND Twist Drill Co.

New York CLEVELAND, O. Chicago

Simonds Hack Saw Blades

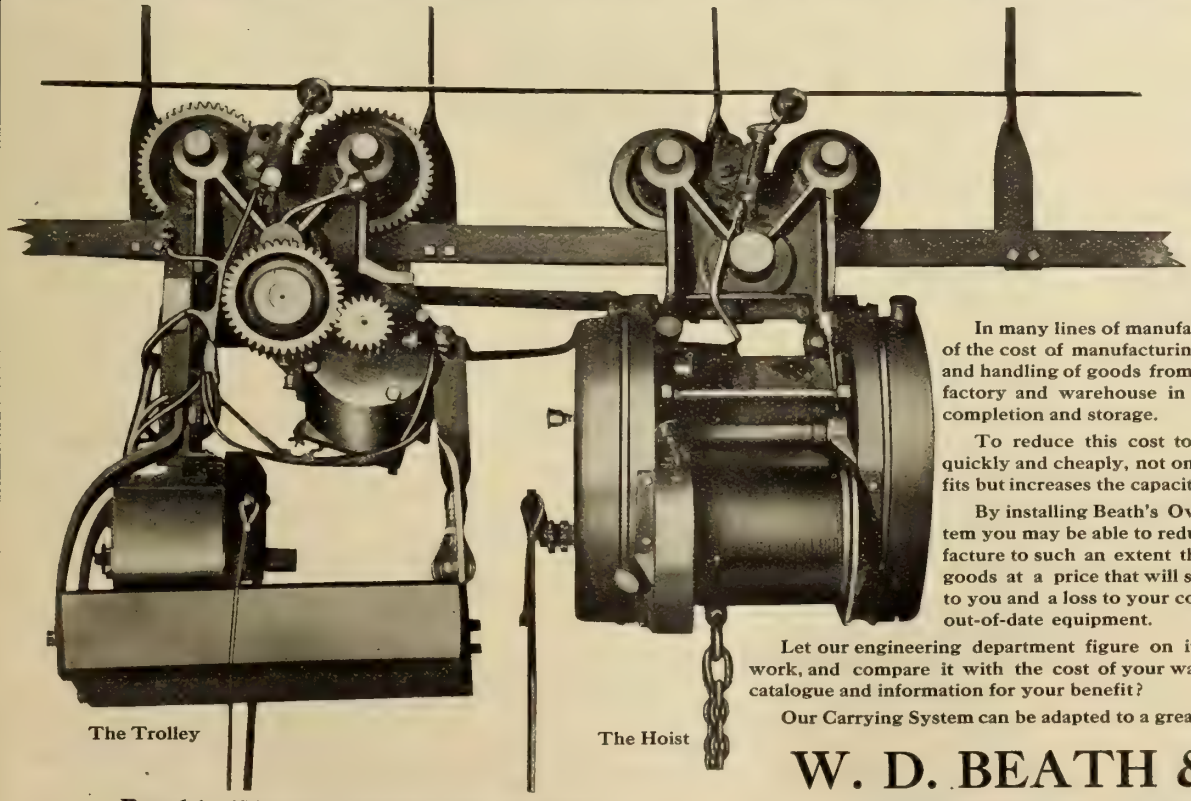
SIMONDS CANADA SAW CO., Ltd.

MONTREAL

TORONTO ST. JOHN

Do you buy over a gross of Hack Saw Blades at a time? If so, we want to hear from you. The "Simonds" brand will give you more cuts per blade than other makes. We want to prove this and save you money. Free sample sent any place in the world.

BEATH'S OVERHEAD CARRYING SYSTEMS



The Trolley

The Hoist

Beath's Electric Hoist and Trolley

Overhead Tracks, Electric and Hand Hoists and Trolleys

For Handling Raw Material and Finished Product

In many lines of manufacture fully 50 per cent. of the cost of manufacturing is in the transporting and handling of goods from point to point in the factory and warehouse in the various stages of completion and storage.

To reduce this cost to a minimum, to do it quickly and cheaply, not only increases your profits but increases the capacity of your plant.

By installing Beath's Overhead Carrying System you may be able to reduce the cost of manufacture to such an extent that you can sell your goods at a price that will still mean a good profit to you and a loss to your competitor who is using out-of-date equipment.

Let our engineering department figure on its way of doing your work, and compare it with the cost of your way. Shall we send our catalogue and information for your benefit?

Our Carrying System can be adapted to a great variety of work.

MANUFACTURERS AND MANUFACTURERS' AGENTS.

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

DUPLICATING DEVICES.

IF interested in a Duplicating Machine for getting out circular letters, reports, price-lists, etc., or for printing various office forms, write for booklet and samples of work. The "POLYGRAPH" is the newest, latest and best, and sells for a lower price than the others. Is unexcelled by any similar device on the market. F. W. Tenney, Canadian Sales Agent, 123 Bay St., Room 116 Stair Bldg., Toronto, Canada.

FOUNDRY EQUIPMENT.

WANTED—To purchase or work on royalty, articles relating to modern foundry equipment, which will guarantee economy and a saving of labor over present methods. Forward blue prints or patterns. Address Box 63, CANADIAN MACHINERY, Toronto.

GASOLENE ENGINE CASTINGS.

MARINE gasolene engine castings, with blue print and full instructions, etc.; 2½, 4, 6 h.p.; also complete finished outfits at $65 up; catalogue, Krug & Crosby, Hamilton. [10tf]

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

MACHINERY FOR SALE.

FOR SALE, at considerably less than cost, a new Campbell Oil Engine, eight horsepower working load, electric lighting type, cheapest source of power for small factory. Jones & Glassco, Montreal.

TO INVESTORS.

ONE of the progressive Western contracting companies last year paid 40% cash from its manufacturing profits. The company is now extending to meet the heavy demand on the coast and now offers a small block of its stock at par. For full particulars, write Box 80, CANADIAN MACHINERY, Toronto.

SALESMAN WANTED.

WANTED—Salesman with knowledge of chemical, not drug, trade in Canada. Good position for right man. Jones & Glassco, Montreal. (2)

MACHINERY WANTED.

WANTED—In good order, power press, open for work in sheet iron. 19 in. diameter, 20 gauge. P.O. Box 127, Shawinigan Falls, Que. (2)

FOR SALE.

FOR SALE—Half interest in a foundry and machine shop, situated in a beautiful town in Ontario. Is a going concern, employing from ten to fifteen hands the year round, with no opposition. For particulars apply to Box 81, CANADIAN MACHINERY, Toronto. (1)

PERIODICAL DEPT.

WANTED in every town of 2000 or over, a representative to take charge of the circulation of our various publications:—Hardware and Metal, Canadian Grocer, Financial Post, Plumber and Steamfitter, Dry Goods Review, Printer and Publisher, Bookseller and Stationer, Canadian Machinery, and Busy Man's Magazine. Good financial standing and business connection a strong recommendation. A permanent position for the right man. The MacLean Publishing Company, Limited, Toronto.

THE BUSY MAN'S MAGAZINE is the most popular periodical of its kind. Why? Because each issue contains a strong list of original articles of interest to every Canadian. It also reproduces the most timely, instructive and interesting articles appearing in the other magazines and periodicals of the month. The cream of the world's periodical press is too valuable to overlook. BUSY MAN'S is on sale at all news-stands. Better still, send $2 for one year's subscription. Mail it to day. The Busy Man's Magazine, Toronto.

THE MARKET REPORTS make Hardware and Metal a necessity to every hardware merchant, paint and oil dealer, foundry, or other metal manufacturing plant, in Canada. It is mailed every Friday. Subscription price $2.00 per year. Address Hardware and Metal, Montreal Toronto or Winnipeg,

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont.

HIGH CLASS COLOR WORK.—Commercial stationery, posters. The Hough Lithographing Co., Limited. Office, No 3 Jarvis Street, Toronto. Telephone, Main 1576. Art, good workmanship, business methods. [tf]

ADDING TYPEWRITERS write, add or subtract in one operation. Elliott Fisher, Limited, 129 Bay Street, Toronto.

THE RELIABLE LIGHT will light your store 100% better than gas, electricity or acetylene. 600 candle power light costs 1 cent per hour to operate. Thousands in use. A safe, reliable, pure white light of intense brilliancy. Write for booklet M. The Rice, Knight Mfg. Co., Limited, 40 Lombard Street, Toronto. (1)

BETTER, CHEAPER, SAFER LIGHTING.—The Pitner System of Gasoline Lighting is the best system yet produced for lighting a store, hotel or public building. In cities and towns Pitner Systems are used because of the superior quality and quantity of light obtained for small cost. They are just as successful in any village or country place. A small outlay secures a complete and independent Pitner lighting plant. Free illustrated booklet and full particulars on request. The Pitner Lighting Co., Limited, Toronto, Canada. (1)

ENGINE BLUE PRINTS FOR SALE.

BLUEPRINTS for 1 h.p. 4-cycle and 3 h.p. 2-cycle motors, $1.50 each per set. A. J. Fisher, 239 Major Street, Toronto. [2-09]

BUSINESS CHANCES.

PATENT NOTICE—The owners of Canadian Patents Nos. 95125, 95126, 96650 and 102647, for improved processes for working silica glass and making articles out of fused silica, and for an improved furnace for working silica, are desirous of finding Canadian manufacturers who will take a license under their patents. The processes are being satisfactorily carried out in Great Britain and a considerable number of articles are being made and sold. Applications for licenses may be addressed either to THE THERMAL SYNDICATE, Ltd., of Neptune Bank, Wallsend on-Tyne, England, or to OWEN N. EVANS, Solicitor of Patents and Expert, Merchants' Bank Building, Montreal, Canada. [4]

BRITISH CATALOGUE REGISTER

The Firms and Companies whose names appear in this "Register" will be pleased to send their Catalogues and Lists, promptly, on receipt of request for same. Correspondents are requested in all cases to use business stationery.

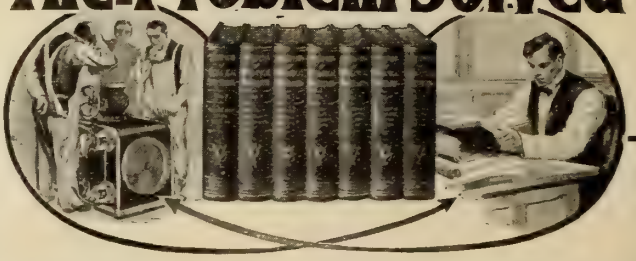
The Problem Solved



How would you like to have a score or more of expert mechanical engineers at your beck and call—men who could solve all the difficult engineering problems that arise? That's just what you have in our new ***Seven Volume***

CYCLOPEDIA OF

MECHANICAL ENGINEERING

3,276 pages, size 7x10 inches; 2,327 Illustrations, Plates, Diagrams, Tables, Formulas, etc.; bound in half morocco.

In these seven volumes we offer you the expert knowledge of thirty-nine men, every one a leader in the line of work he handles. They offer you the knowledge of recent time-saving inventions, practical information—they straighten out shop kinks, give you the inside information and short-cuts which are generally found only in the private note-books of high-salaried shop bosses.

The Cyclopedia covers the entire field of mechanical engineering—making and use of tools, machine shop work, construction and operation of boilers and engines, pattern making, foundry work, gas producers and gas plants, mechanical drawing and machine design. No branch too big to be treated in detail, no detail too small to be slighted.

These books are as plain to the student as they are helpful to the master workman.

It Costs Nothing to Look

Upon receipt of coupon we will send you a set of this great Cyclopedia, by prepaid express, without deposit or guarantee of any kind. Keep the books five days, examine them carefully, give them every possible test. We want you to be the judge—you are under no obligations.

If you decide the books are not what you want, advise us and we will have them returned at our expense. If you keep the books send us $2.00 within five days and $2.00 a month until you have paid the special price of $18.60. Regular price is $36.00. ***This offer is good until March 1st.***

IMPORTANT SUBJECTS COVERED

Machine Shop Work—Vertical Milling Machine—Motor-driven Shops—Shop Lighting—Forging—Electric Welding—Tool Making—Metallurgy—Manufacture of Iron and Steel—High Speed Steel—Flaws in Castings—Electric Lifting Magnets—Magnetic Clutches—Making a Machinist—The Ideal Foreman—Pattern Making—Foundry Work—Automatic Coal and Ore Handling Appliances—Machine Parts—Construction of Boilers—Types of Boilers—Boiler Accessories—Steam Pumps—Air Compressors—The Steam Engine—The Steam Turbine—Indicators—Valve Gears—Refrigeration—Gas Producers—Gas Engines—Automobiles—Elevators—Sheet Metal Work—Practical Problems in Mensuration—Mechanical Drawing—Drafting Room Organization—Machine Design.

FREE! Order at once and we will include for one year, as a monthly supplement, the

Technical World Magazine

A regular $1.50 monthly, presenting twentieth century scientific facts in plain English. Latest discussion on timely topics in science, invention, discovery, industry, etc. The strongest serial of the season, "WHO OWNS THE EARTH," appears in the February issue. ***Just mail the Coupon.***

ON THE MOVE

In order to keep up with the demand we have found it necessary to move to larger quarters in Toronto. Our Toronto warehouse and offices are now located

at 20 Pearl Street

where we have increased our stock, added new lines, and are in a position to give prompt service to the foundrymen. : : :

Samples and Prices Cheerfully Submitted — Give Us a Trial

The Dominion Foundry Supply Co., Ltd.

TORONTO Ont. — MONTREAL Que.

EUREKA! We have found it—and a great many foundrymen can testify thereto if you will ask them about our

Eureka Blacking

for use as a dry sand or wet blacking.

Requires no clay wash, molasses water or sour beer in its preparation, and when dried absolutely will not rub off.

Better than Plumbago or any other core wash for this purpose.

Sold under guarantee—"No pay if not satisfactory." Try it. We take all the chances.

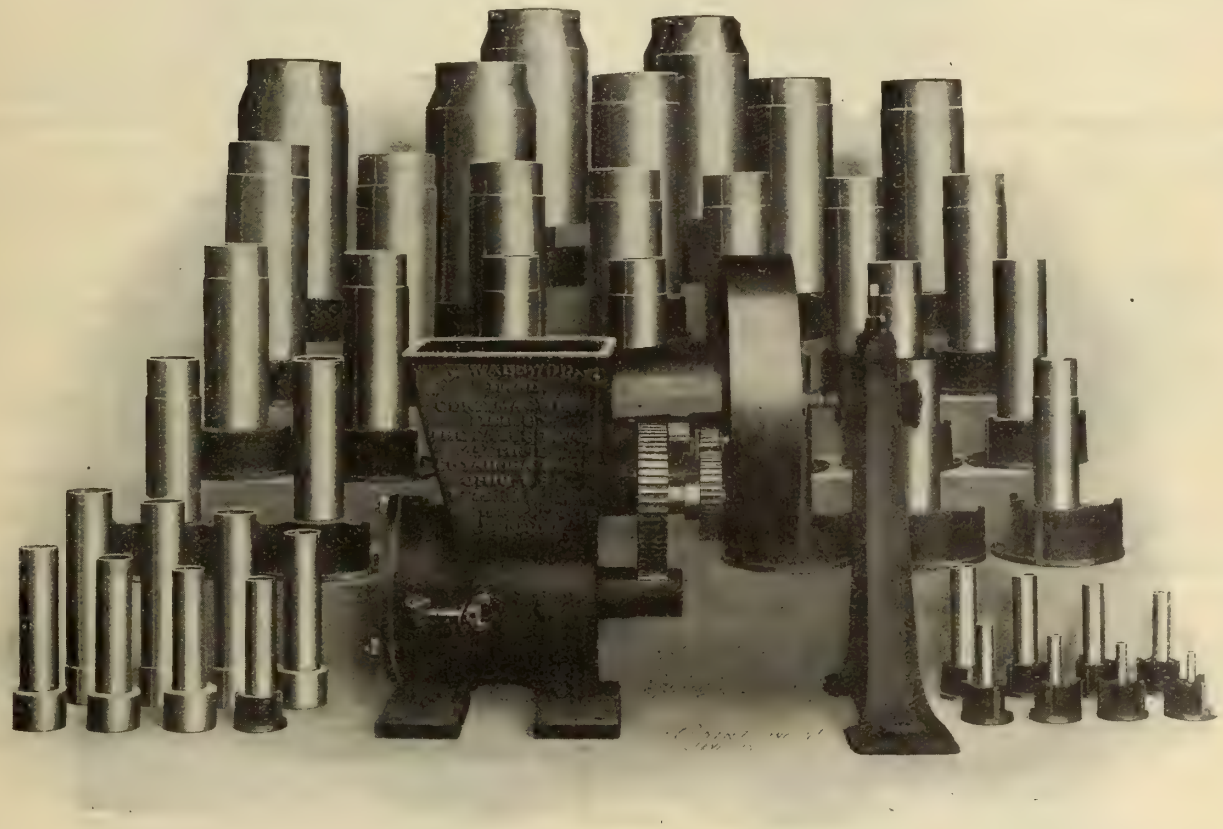
THE WADSWORTH
IMPROVED CORE MACHINES

The only Core Machine manufacturers in the world manufacturing a complete line of Core Making Machinery—5 separate and distinct Core Making Machines, Portable Core Ovens to bake the cores in after making. Core Cutting Off and Coning Machines and manufacturers of a Standard Core Print.



The only Core Machine manufactured that can make a Rodded Core. Any size rod can be used. Hand or Power driven, makes round Cores from ⅜ in. to 7 in. Also irregular shapes. 40 sizes of Cores, all made on one machine.

We are Core Machine Specialists

Compare your time with that of THE WADSWORTH Machine.

One 6″ Core, 24″ long, by hand power in 12 seconds.
One 7″ Core, 5′ 3″ long, by hand power in 80 seconds.

The great strength and accuracy of cores, together with the wide range of shapes possible, make them a valuable foundry investment.

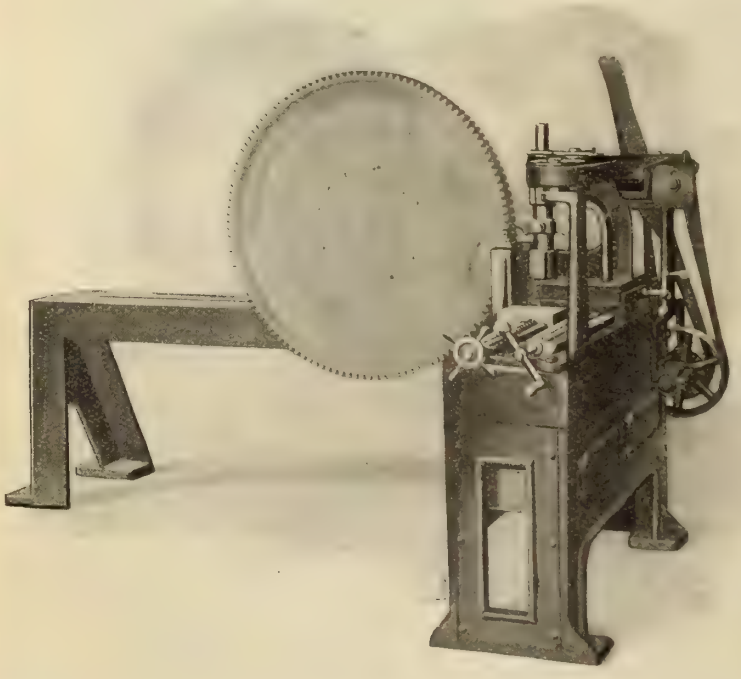
REVOLUTIONIZE YOUR SYSTEM

of Making Your Wood Spur Gear Patterns



The cut shows our patent combination Lath and Gear Cutter. The old way of making gears by hand is very uncertain and expensive. By means of our machine, the gear after being glued together, is fastened to face plate and turned up and then adjusted properly so that it is in right position, when the cutters will then cut out the teeth. After teeth are cut, there is no need of further finishing or sandpapering, simply a coat of shellac and your pattern is ready for the foundry. You can easily save 75 per cent. of the cost of your gear patterns by the use of our machine, and you will know to an absolute certainty that gear is perfect. This is next to impossible where gear patterns are made by hand. This machine will take care of a gear from 10 in. in diameter to 12 ft. in diameter, and from 1 in. face to 24 in. face.

WRITE FOR OUR PATTERN
DEPARTMENT CATALOGUE

We also manufacture Cleaning Mills, Cinder Mills and Dust Arresters. If interested, write for complete foundry catalogue.

CLEVELAND, OHIO, U.S.A.

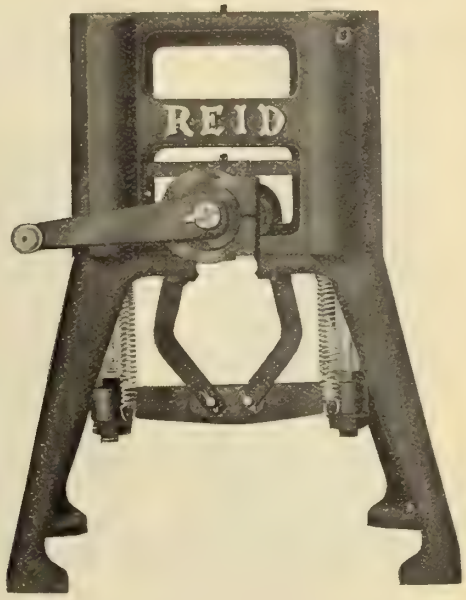
IN THE SAVING OF TIME AND MONEY

THE

"REID" Hand-Rammed, Stripping Plate MOLDING MACHINE

EXCELS ALL OTHERS.

¶ This fact has been demonstrated to the absolute satisfaction of a large number of the more prominent foundrymen of the United States and Canada. The superintendent of one of the largest foundries in the United States, who has used all styles of machines, says that the "REID" is the cheapest, most rigid, and most perfect draw-down machine he ever saw. ¶ Send for our booklet. It gives in actual detailed figures the saving accomplished by the Reid Molding Machine in one foundry.



12-in. Machine

HARVEY, ILLINOIS, (Chicago Suburb)

Built in 12 sizes. Holding from 400 to 2,200 pounds of sand. Shipped on ten days' trial.

Danic Sand Blasts are Worthy of Investigation

Some of the Reasons:

(1) Any pressure up to 100 pounds available, giving most satisfactory results in every line of work.
(2) The flow of sand is under perfect control and is free and uniform at all times.
(3) There are no special or costly parts to break or get out of order.
(4) They are economical in cost and efficient in operation.

LET US TELL YOU THE REST.

Batcheller, Clark & Batcheller, Inc.,
140 CEDAR STREET, - NEW YORK

FOUNDRYMEN!

The past year marked the introduction of our Foundry Supply Department and although a new line with us, we feel gratified at the large amount of business secured during the year 1908, and we thank you for your very generous patronage and hope to have a continuance of the same during the present year.

In order to give greater attention to our growing Foundry trade and to take the best means of presenting the many advantages of our specialties and productions, we have divided the ground into three territories which will be covered by our representatives as follows:

Eastern Territory - Mr. Albert U. Coté
WesternTerritory - Mr. T. Essery
Montreal Territory - Mr. G. F. Cowper

When in doubt specify Hyde quality.

TRADE MARK—REG. U. S. PAT. OFF.

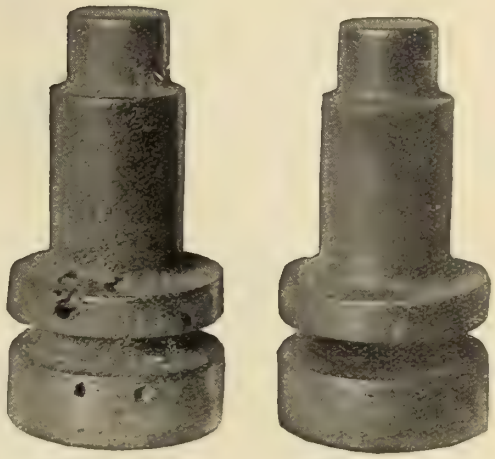
Pump Repaired with Smooth-on Iron Cement No. 1 six years ago. and still in use.

Write for circular showing how work was done.

SMOOTH-ON IRON CEMENT No. 1

is prepared in powdered form—for use mix with water. It is unequaled for stopping leaks of Steam, Water, Fire or Oil, because it becomes metallic iron that has the same expansion and contraction as iron, thus keeping tight at all temperatures. Engineers and Foundrymen use it where a smooth surface and metal-like hardness are desired.

Sold in Blue Label Cans.



Before Using Smooth-On Castings. After Using Smooth-On Castings.

Cheapest and Best Cement on the Market for Foundry Use.

Sold in Yellow Label Cans.

FOR SALE BY SUPPLY HOUSES.

THE CAMPAIGN OF 1909

When a political campaign document is constructed it must be carefully constructed or else it is liable to be punched full of holes.

The error is discovered too late.

It is much the same way in the foundry business; the error in use of poor materials is only discovered when it is too late for correction.

If you are making machinery castings, you ought not to keep house without **STEVENS' PURE PLUMBAGO.** It is the pure quill. It goes farther in actual use, and produces a clean, smooth face.

If you are using a wet blacking on molds or as a core wash, **STEVENS' CARBON BLACKING** will give you pocket-book satisfaction.

If you want to fill a hole in a casting, otherwise good, **STEVENS' STOPPER** will stop it so you cannot find it; a fine powder mixed with water, easily applied, and costs much less than the many substitutes.

KING KORE KOMPOUND—one part compound to thirty or forty parts of sand, and no odor and no trouble.

I manufacture Foundry Facings, Foundry Supplies, Buffing Compositions and Platers' Supplies. They all bear the stamp of quality.

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

Improved Levels for Testing Shafting, etc.

In addition to the regular parallel vial, the bases have a cross level which enables one to place or hold the base on a shaft level in its cross section, not canted sidewise; for the shape of a level glass is such that, though true as adjusted on a flat surface, it will not be reliable when canted sidewise. Hence the value of the cross level, not only to test the truth of shafting, but other surfaces which tend to throw the level base into a canting position.

The base of this level has our improved concaved groove running through the length of its base, leaving a flat margin each side, which improves its seat for flat work, while forming an absolutely true and reliable seat for shafting, etc, and it is better than a V groove. Made in 6. 8, 12 and 18 in. sizes with plain vials and with ground and graduated vials.

TESTED TOOLS

YOU may say that most tools are subjected to more or less testing by their manufacturers. You may be right. It is especially severe testing that has raised our tools —BUTTERFIELD TAPS, DIES and REAMERS—into the "Standard" class. They are tested as to purity of material and correct chemical composition; they are tested as to temper; they are tested as to accuracy. In all these points BUTTERFIELD tools must reach the pitch of absolute perfection before we will ship them to you. If you have ever tried Butterfield Tools you are still using them; but if you haven't, just give them a trial next time you are ordering any taps, dies and reamers. For the sake of reference you had better write for our catalog.

if you are a subscriber to "Canadian Machinery," by sending in to us the specified number of new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

PATTERN MAKING

By JAMES RITCHEY

Instructor in Wood Working, Armor Institute of Technology.

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00.

Given free with two yearly paid-up subscriptions.

Handbook of Practical Mechanics

By CHAS. H. SAUNDERS

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00 Postpaid.

Given free with two yearly paid-up subscriptions.

MACHINE SHOP WORK

By FREDERICK W. TURNER

Instructor in Machine Shop Work, Mechanic Arts High School, Boston.

208 pp., 200 illus. Cloth binding. Abounding in interesting illustrations and valuable instruction in the practical use of all sorts of tools and machines used in the up-to-date machine shop, and will be found to meet every requirement of the shopman, from the simplest tools to the most complex turning and milling machines. Contents include Tools Operated by Hand, Power Driven Tools, the Lathe, Drill Press and Planing Machines, Milling and Grinding Machines.

Price, $1.50.

Given free with three yearly paid-up subscriptions.

TOOL MAKING

By EDWARD R. MARKHAM

Instructor in Machine Shop Work, Harvard University and Rindge Manual Training School, Formerly Superintendent Waltham Watch Tool Co.

225 pp., 325 illus. Cloth binding. The whole subject is here exhaustively treated and profusely illustrated. The information given is of inestimable value to all machine shop men, metal and wood workers, and all whose tasks may occasionally call for the exercise of mechanical skill, ingenuity and inventiveness in the devising of special means to accomplish special ends.

Price, $1.50.

Given free with three yearly paid-up subscriptions.

FOUNDRY WORK

By WM. C. STIMPSON

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

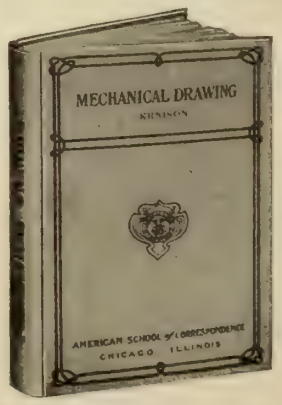
Price, $1.00.

Given free with two yearly paid-up subscriptions.

MECHANICAL DRAWING

By ERVIN KENISON, S. B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology.



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00.

Given free with two yearly paid-up subscriptions.

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

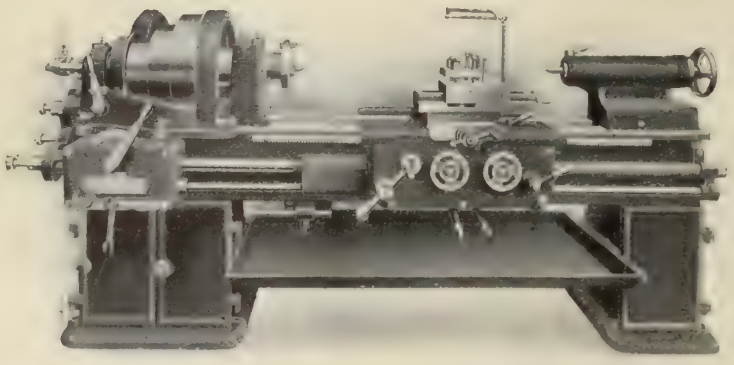
The International Time Recording Company of Canada, Limited

67 Yonge St., - - Toronto, Canada

ENGINE LATHES

(12-inch to 56-inch Swing)

Manufactured by the well known firm of DEAN, SMITH & GRACE, LTD., of Keighley, England, who are considered second to none in manufacturing tools of this description.



In the general specifications these lathes surpass all others and will be found to withstand the heaviest cutting without strain. The beds are of strong box section with large bearing-surfaces, and we claim that this type of bed is superior to the numerous "narrow-guide" types that have been put on the market. The springing of the bed can be obviated by using a properly-shaped section. We firmly believe that in weighing up the advantages of both types, whether for economy, durability, or accuracy, an impartial investigator would award the palm to the **"wide-way" bed.** The Fast Headstocks are constructed with a view to rigidity and strength. The Loose Headstock has a large base, and is gripped to the bed by eccentric and handle; it is adjustable sideways for taper turning. The spindle is accurately ground. The bearings are provided with self-oiling arrangement by means of oil well and chain. A Reversing Motion is placed in the Headstock, and we also call attention to the patent device for oiling the cone in the larger size of lathes, by which a continuous supply of oil is fed to the bearings. These lathes are manufactured with or without friction-geared heads, and with hollow steel spindle which is accurately ground and run in ample parallel bearings of phosphor bronze. The gearing is correctly graded to a uniform rate of speed. Complete and illustrated catalogue describing these machines will be sent on application.

In addition to the above, we carry a complete range of machine tools of every description, including Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Slotters, Bolt and Nut Machinery, Cutting-Off Machines, Drilling Machines, High Speed Cold Saws, Turret Lathes, Brass Finishers' Lathes and special machinery of every kind.

We also carry Velos High Speed Steel and Twist Drills and Special Steel for all purposes, Pneumatic Tools, Chain Hoists, Woodworking Machinery, etc.

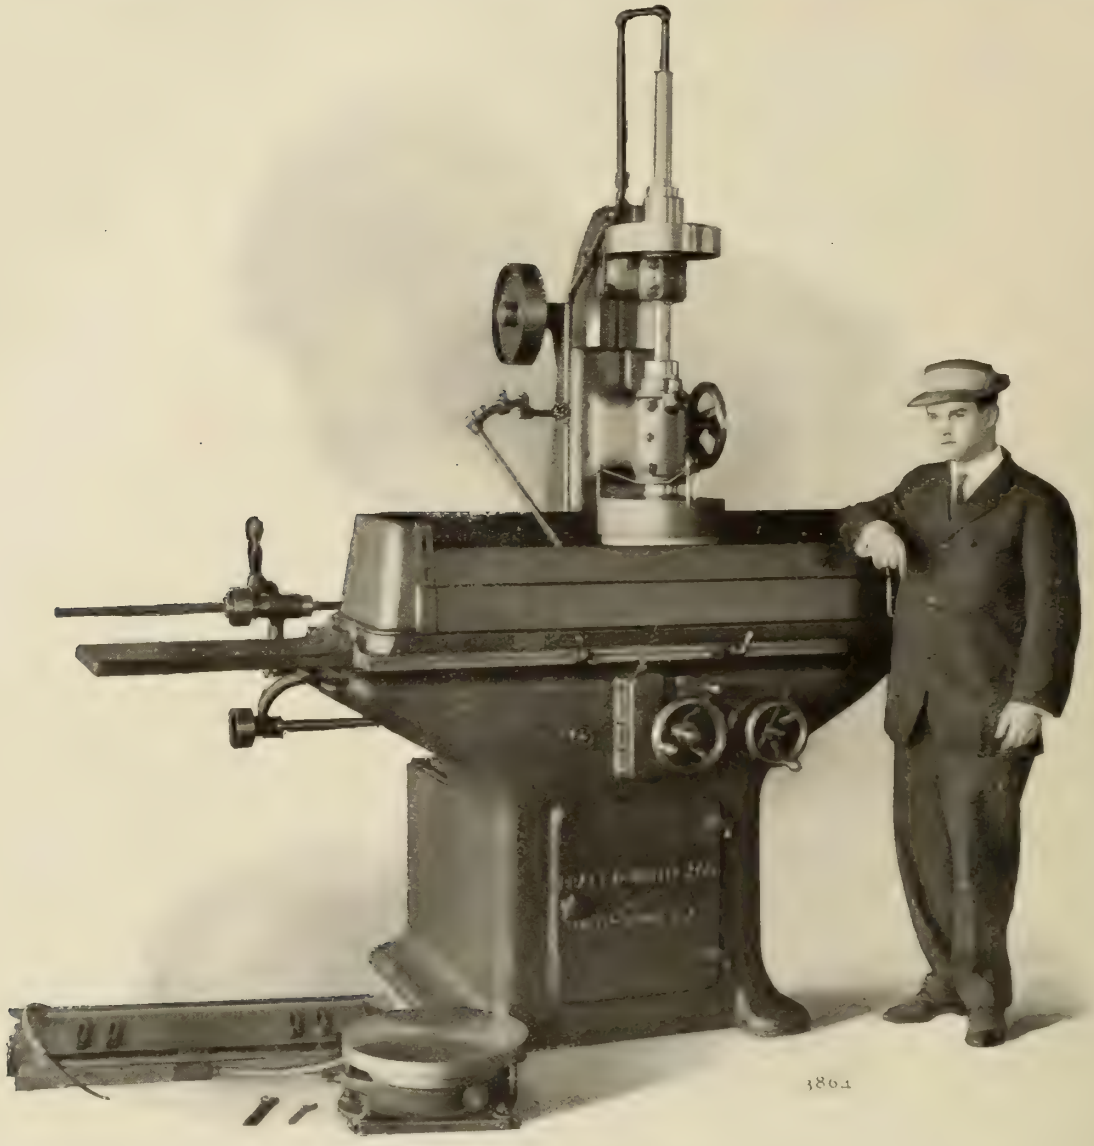
VERTICAL SURFACE GRINDER

WILL GRIND FROM 10 to 25 TIMES FASTER THAN ANY OTHER SURFACE GRINDER KNOWN.



The vertical cup wheel covers full width of work at once, insuring more perfect surfaces and much greater output than is possible with any other grinder.

Water enters through the hollow spindle and is driven by centrifugal force between the wheel and the work, thus keeping work free from dust.

All bearings, oil holes, etc., are fully protected from water.

Particularly efficient for such work as Dies, Inserted High Speed Blades for Cutters and Reamers, Gauges, Thrust Collars and Washers, Theading Dies, Vises, Gun and Pistol Parts, Parts of Safe Locks, Automobiles, etc.

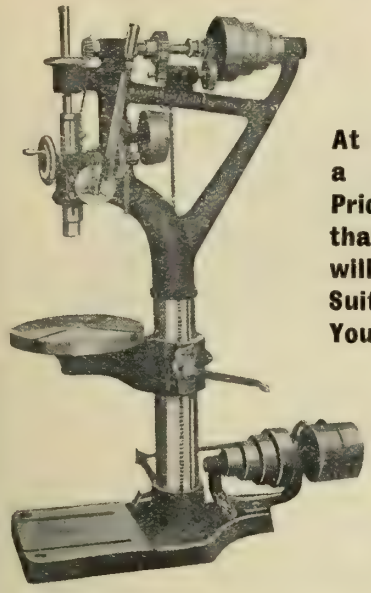
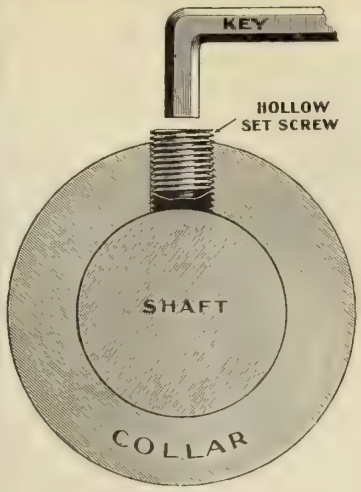
A Good Drill



At a Price that will Suit You

Most powerful drill of its size on the market. Screw has quick return and automatic stop. Table is raised by a crank which retains its relative position to the table at all times. Shafts are steel, gears cut two to one; cone has four changes for belt. Drive pulleys are 8 in. in diameter with 3 in. face and will make 300 revolutions per minute. Many other good points and measurements explained in circular.

BAWDEN MACHINE TOOL CO.,
22 Orillia Street (back of Iroquois Hotel)
TORONTO - - - - - - CANADA



Hollow Set Screws

Made in four sizes $\frac{3}{8}$", $\frac{1}{2}$", $\frac{5}{8}$", $\frac{3}{4}$" with V thread and cup points.

Factory inspectors insist on the use of Hollow or Safety Set Screws. Protect the lives of your men and prevent law-suits arising from use of old style screws with projecting heads.

Hollow Set Screws replace both headless and square head screws, and *one length* of each size is all that is required for any depth of hole. By putting two screws in a hole they are locked and the thread strain is equalized. The power on wrench is applied equally to the entire length of screw; with the old style the head is liable to twist off.

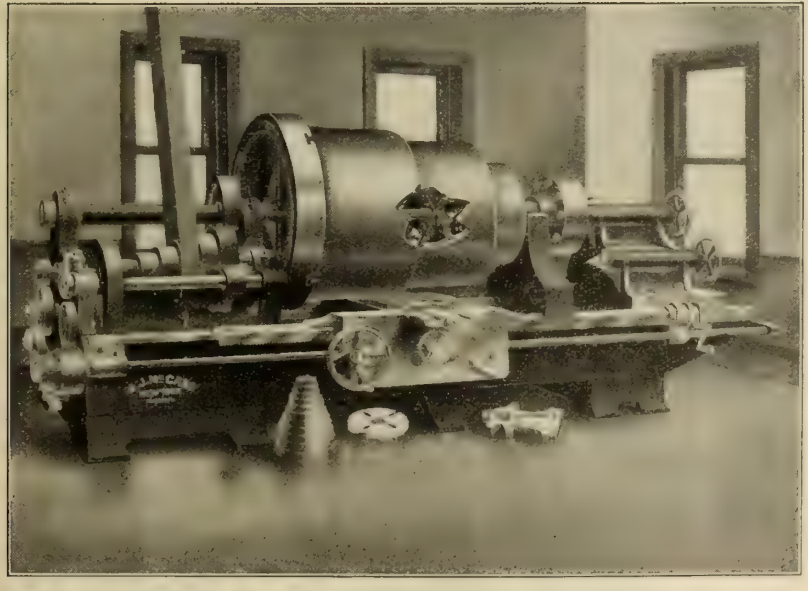
No. 2 Machine for bar stock up to 2¼ x 24 inches

HOLLOW HEXAGON TURRET LATHES

A Gap-bed Lathe Only Was, but No Longer Is—



You can find the capacity in other Lathes, but not in any one machine

¶ **McCabe's "2-in-1" Double Spindle Lathe** gives you the capacity and convenience of "two complete Lathes" which you looked for in the "Gap-bed" and didn't find.

¶ It is one of the "modern improvements" on the "Gap" Machine—does everything you could do on the Gap Lathe, and half again as much more—but doesn't cost any more.

¶ All the details of construction, and good, simple, reliable features you have come to know as "standard" in

¶ A powerful triple-geared 48-inch—and—
A back-geared 26-inch Lathe.

¶ No such "stand up" qualities ever given in any other Lathe.

¶ If you don't get McCabe's "2-in-1" **Double-Spindle** Lathe it's either because you "don't know"—or else you want to be out of date.

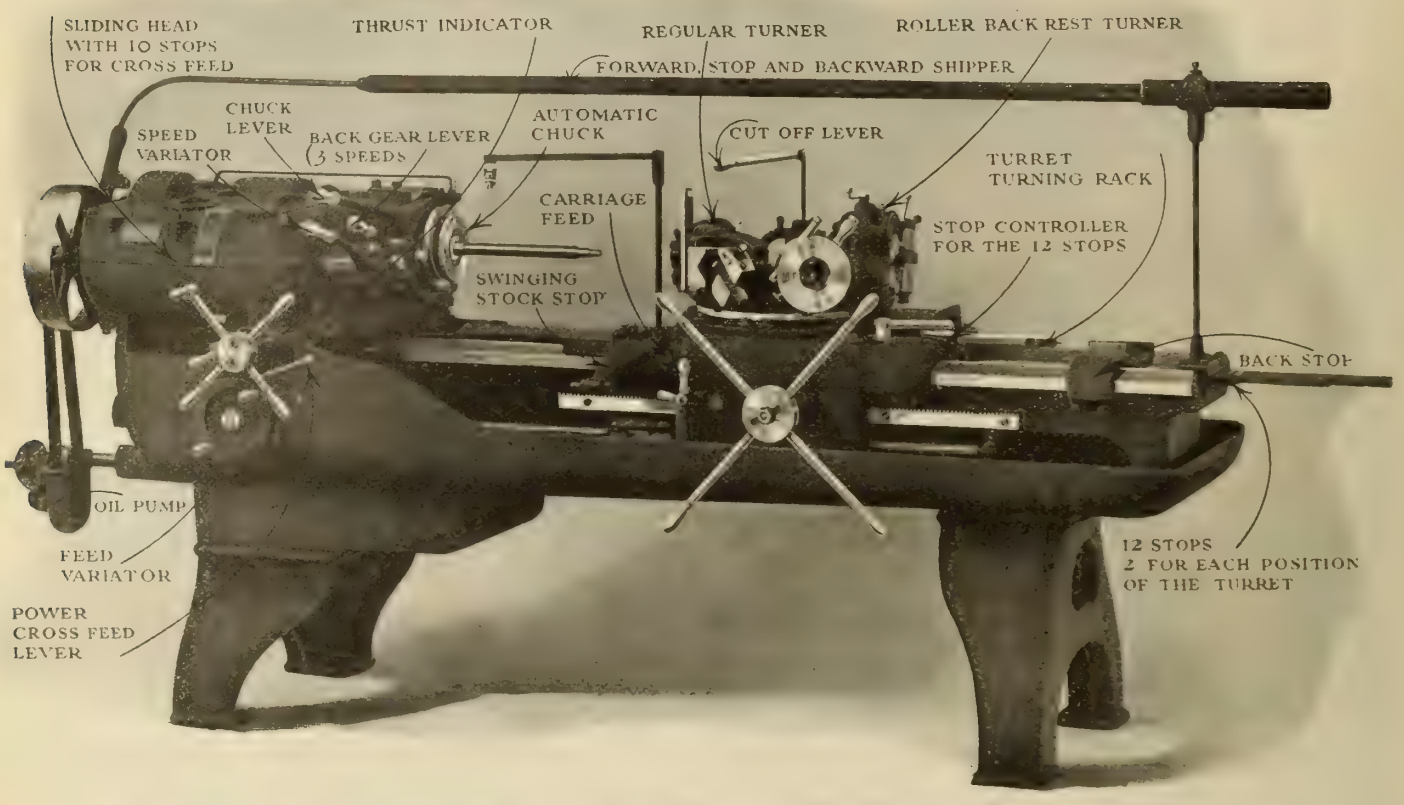
J. J. McCABE

"The Double-spindle Lathe Man"

30 Church St. • New York

THE

Hartness Flat Turret Lathe



Our entire plant is devoted to the building of Flat Turret Lathes exclusively. We have been following this policy of sticking to one thing for over twelve years.

SOME OF THE CHARACTERISTICS OF THE HARTNESS FLAT TURRET LATHE ARE

Originality in design—Unflinching control of work and tools
Accuracy of output

The Lathes are now equipped with outfit of tools for handling both bar and chucking work. This tool equipment is of the adaptable kind, taking care of all work within the range of machine—NO SPECIAL TOOLS REQUIRED. A change in your product does not call for a new tool equipment.

Our aim is to lead—not follow.

Our Catalogue gives full particulars, shall we send you a copy?

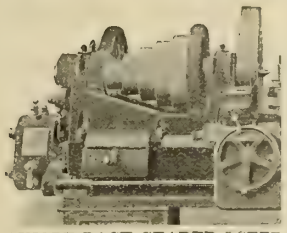
Jones & Lamson Machine Co.

Springfield, Vermont, U.S.A. and 97 Queen Victoria St., London, Eng.

NO ONE TYPE OF LATHE HEAD

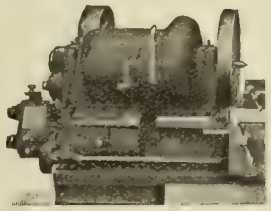
IS ADAPTED TO ALL CONDITIONS OF LATHE WORK

IN THE MODERN MANUFACTURING PLANT



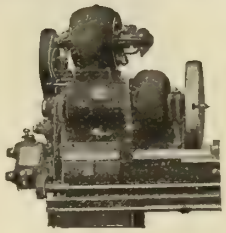
SINGLE BACK GEARED 5-STEP CONE

For all usual requirements in shop or tool room.



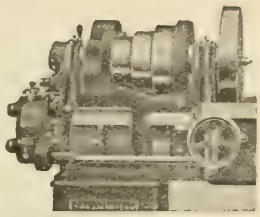
ALL-GEARED HEAD SINGLE PULLEY DRIVE.

Enormous gear ratio and belt power for heaviest class of work.



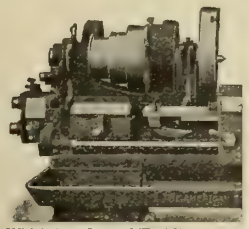
MOTOR DRIVE

For individual motor drive. Gives wide range of spindle speeds.



DOUBLE BACK GEARED 3 STEP CONE

High power, extra gear ratio and wide range of spindle speeds.



FRICTION BACK GEARED

For chucking purposes using turrets also for general manufacturing in steel, iron or brass.

"AMERICAN QUICK CHANGE LATHES"

(14 in. to 62 in. swing)

Can be equipped with headstocks particularly suited to your work—such tools insure a profitable equipment.

In a manufacturing plant it is misplaced economy to attempt the use of any one type of lathe head for all purposes.

Think the matter over, then write us about your requirements—it is a subject very near your pocket book.

Derrer Oval Taper Drill Sockets

Give An Absolute Perfect Positive Drive

THE accompanying illustration shows the appearance of the hole and the proportion of the oval.

We have adopted a standard on all of our tapers of three-eighths of an inch to one foot, and also a uniform standard of oval.

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others:

- From one-third to one-half shorter.
- No tangs to twist off.
- No set screws or keys.
- Positively no slipping or binding.
- All our work interchangeable.
- Absolutely true running drills.
- Drill breakage reduced to a minimum.
- Drill accounts reduced 25 to 50 per cent.
- 25 to 50 per cent. more work through your drill presses.
- Chuck and socket account reduced 75 to 90 per cent.
- A drill chuck or socket that is practically indestructible.
- Gives an absolute perfect positive drive.

One 23½" x 18½" x 24" with vise.
One 23" x 18" x 5' English.
One 20" x 20" x 50" with vise.
One 12" x 12" x 27" American.

IRON SHAPERS

One 15" x 48" openside Cincinnati
One 15" x 30" openside Cincinnati.
One new 32" B.G. Cincinnati.
Two new 24" B.G. Rockford.
One nearly new 24" B.G. Sarnia.
One refitted 24" traverse head.
One refitted 16" Smith & Mills.
One refitted 15" traverse head.
One new 7" Rhodes hand or power.

MILLING MACHINES

One new No. 2 plain Cincinnati.
One refitted 27" x 6" x 13" Lincoln.
One new No. 3½ Fox, hand or power feed.
One new No. 3 Fox, hand or power feed.
One refitted No. 3 Reed Co.
Two new No. 2 Fox, hand power.
One refitted No. 1½ American.

BOLT AND PIPE MACHINES

One new 2" bolt cutter, with Galt culver automatic head.
Two refitted 2" bolt cutters.
One refitted 1" Acme bolt cutter.
One rebuilt 2½"—5" Curtis hand or power pipe machine.
One new 1"—4" McDougall pipe machine.
One refitted ¼"—2" Jarecki hand or power pipe machine.
One refitted ¼"—2" Apex hand or power pipe machine.
One nearly new ¼"—2" Borden hand pipe machine.

POWER PRESSES

Four new No. 21 power presses.
One new No. 20 power press.
Six new No. 19 power presses.
One refitted Bliss stamping press.
One refitted No. 4 punching press.
One refitted London stamping press.
One refitted No. 2 Stiles & Parker
One refitted No. 2 Fowler's patent
One refitted French double head.
Two refitted hand screw presses.

GRINDERS

One new cutter and reamer grinder.
Two new American centre grinders
One refitted stove plate grinder.
One new No. 3 Prescott grinder.
Twelve new pedestal grinders.
Ten new bench grinders.
Two refitted surface grinders.
One new bench twist drill grinder.
One new No. 2 water tool grinder.
One refitted double-wheel water tool grinder.

MISCELLANEOUS

One new 30"Gisholt boring mill.
One refitted 36" Gould & Eberhardt gear cutter.
One 5½" x 18" Bell Steam Hammer.
One 8" x 18" Bell steam hammer.
One 50 lbs. foot power hammer.
One 18" Bremer punch and shear.
One 12" Bremer punch and shear.
One 16" Globe tumbling barrel.
One 10" Globe tumbling barrel.
One 87" plate bending rolls.

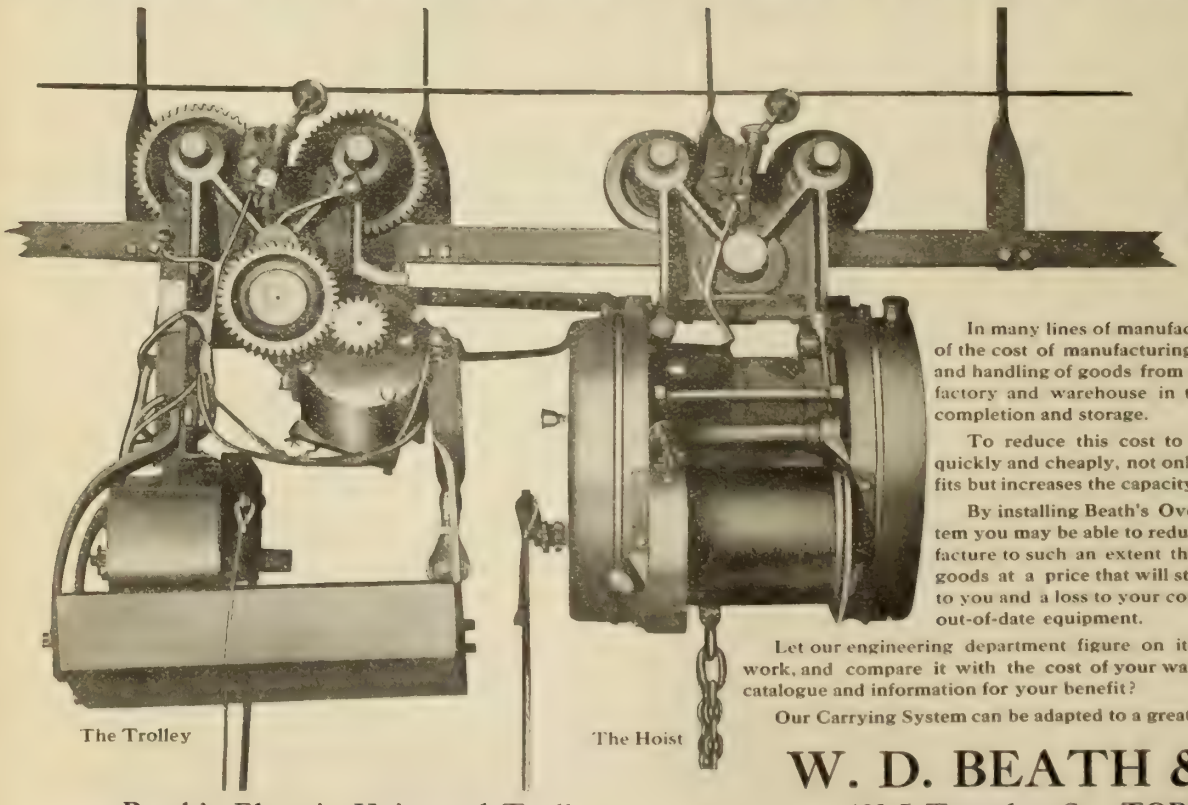
BEATH'S OVERHEAD CARRYING SYSTEMS



The Trolley

The Hoist

Beath's Electric Hoist and Trolley

Overhead Tracks, Electric and Hand Hoists and Trolleys

For Handling Raw Material and Finished Product

In many lines of manufacture fully 50 per cent. of the cost of manufacturing is in the transporting and handling of goods from point to point in the factory and warehouse in the various stages of completion and storage.

To reduce this cost to a minimum, to do it quickly and cheaply, not only increases your profits but increases the capacity of your plant.

By installing Beath's Overhead Carrying System you may be able to reduce the cost of manufacture to such an extent that you can sell your goods at a price that will still mean a good profit to you and a loss to your competitor who is using out-of-date equipment.

Let our engineering department figure on its way of doing your work, and compare it with the cost of your way. Shall we send our catalogue and information for your benefit?

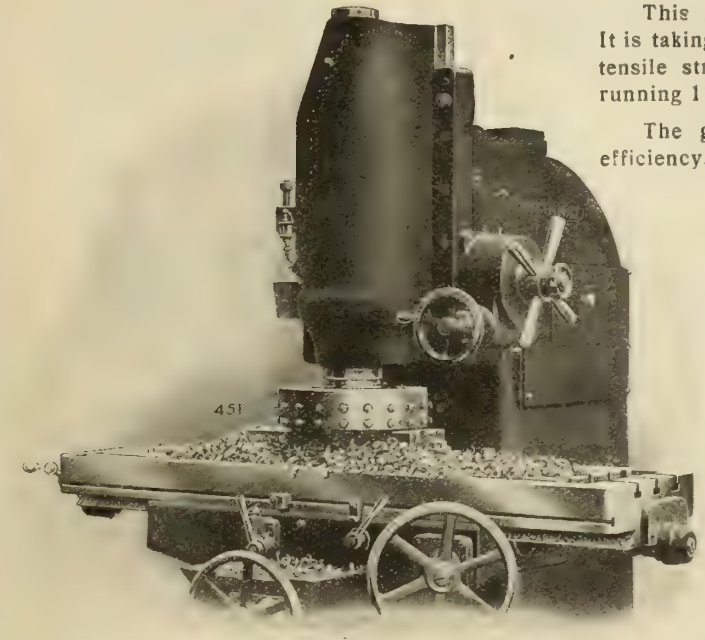
Our Carrying System can be adapted to a great variety of work.

W. D. BEATH & SON

193-5 Terauley St., TORONTO

The No. 4 Vertical High Power Cincinnati Miller

Removing 10 Cubic Inches of Steel Per Minute.



This machine is direct connected to a 10-horse power motor. It is taking roughing cuts across machine steel bars of 55,000 pounds tensile strength, 50% elongation, with a cutter 12 inches diameter, running 17 revolutions per minute.

The gross horse power used is 12.1. Corrected for motor efficiency, the net horse power is 10.

The cut is 5 inches wide, $\frac{1}{8}$ inch deep, feeding 16 inches per minute. This amounts to 10 cubic inches steel removed per minute, **or one cubic inch per net horse power minute.**

Some of the features which make this high efficiency and large cutting capacity possible are : Large spindle and head; no torsional vibration in transmission shafts; securely clamped tumbler; quick pitch feed screws.

WOULDN'T YOU LIKE TO DO MILLING AT THIS RATE.

Ask for our High Power Miller Catalog.

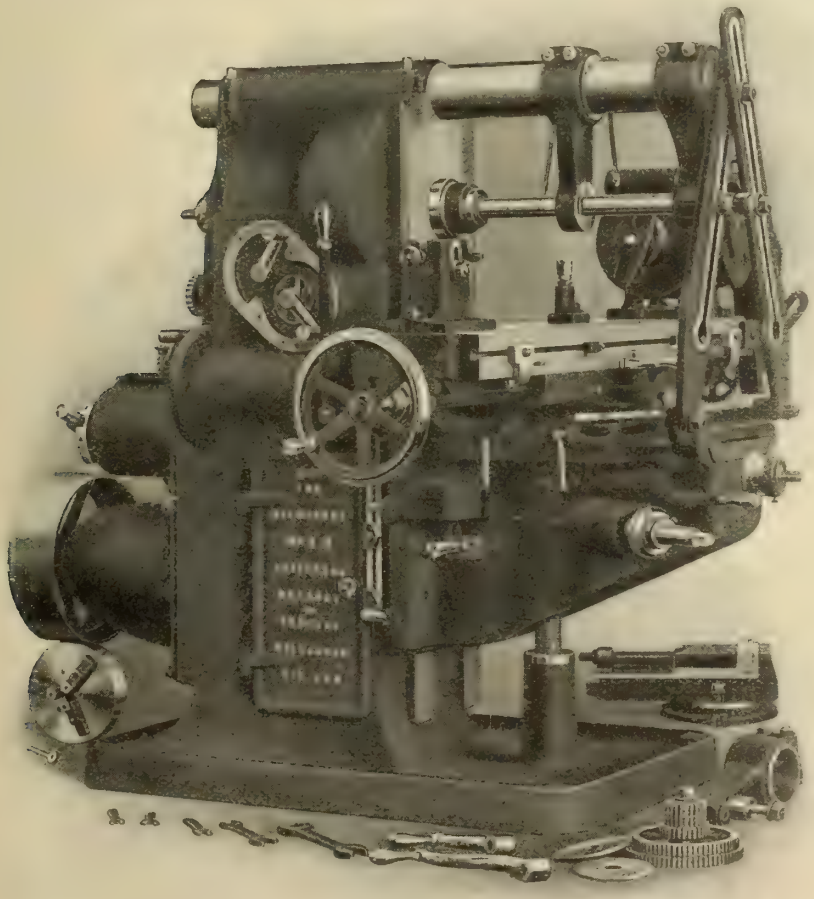
CINCINNATI, OHIO, U.S.A.



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

KEMPSMITH

MILLING MACHINES

are built to withstand continuous rough usage under severe modern manufacturing methods. The essential members are all massive for the size of the machine, and there is no weak, limiting point in the entire operative mechanism. Operation is concentrated, nothing complicated — so strong and simple that it is proof against trouble from careless or ignorant handling. Guaranteed to be built **right** to the smallest detail. The whole machine is **reliable** and **safe**, and merits close investigation.

No Use Having Two Machines When One Will Do the Work!

An ingenious and high-grade machine.

Both sides independent.

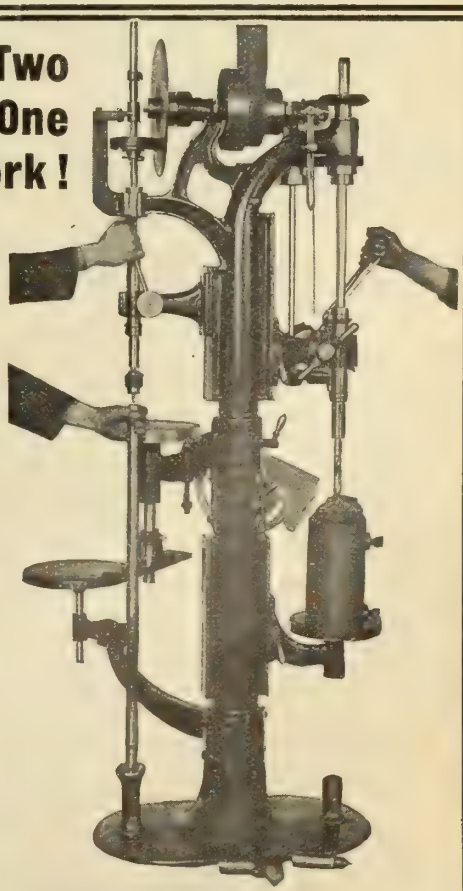
One side, sensitive drill with variable speed friction drive. Capacity up to 7/16 inches.

Other side regular power or hand feed drill. Capacity up to 1 inch.

Removable seat to be used on either side if desired.

Knee feed drill, sensitive drill, manufacturer's drill. It's all there.

Look at illustration and write us for more information.



LAPOINTE MACHINE TOOL CO., - HUDSON, MASS.

Here is a page from booklet "Helps-Don'ts." The booklet will be mailed to anybody.
—NORTON COMPANY

In cylindrical grinding, speed of work, diameter of work and depth of cut must all be reckoned with in the selection of the right combination of grain and grade.

The condition of the machine affects the efficiency of the wheel. Heavy machines with large wheel spindles and massive wheel support call for a different wheel than lighter machines with smaller spindles.

If the work is to be applied by hand that, too, will make a difference.

Your neighbor's conditions are not necessarily your conditions.

Don't order a certain grade wheel merely because that grade is used on similar work in another plant.

Don't use a hard wheel to economize—it is production you are after; big production is economy.

A hard wheel is more apt to change the temperature of the work or to become glazed than a soft one; furthermore it requires more power to do the same amount of work.

It is a common error, when grinding steel and cast iron, chilled iron and hardened steel, that to produce a fine finish a wheel must be as fine as the surface desired. A coarse wheel will produce a fine finish, if certain facts about grade, depth of cut, speed of work, speed of wheel, etc., are observed.

Norton Grinding Wheels made of Alundum are furnished in the combinations of grain and grade necessary for all kinds of grinding. The "Norton Experience" covers your grinding problems. We can help you.

Single and Double Gears

So much depends on the accuracy of such work that one cannot be too careful in their selection. It is well known that machine finished parts are not uniform, that there is always more or less variation in the different pieces. This calls for a large amount of fitting and many pieces are thrown out altogether.

The **FRANKLIN** Die Cast Process prevents all this. Our castings are accurate and finished ready for use.

Write for our new Booklet F, describing Franklin Die Castings and the Process. It is interesting.

Dear Sirs:-

We feel that in justice to you we should advise you that your appraisal was of invaluable assistance to us in adjusting the loss through the fire that took place on Dec. 24th. last and entirely destroyed our factory and plant.

Your figures were accepted without hesitation by the insurance adjustors and we were complimented upon the way in which we were able to prove the values of our buildings and machinery.

We could hardly write you a letter expressing too strongly our views on the matter of the necessity of an appraisal, and our recent experience has convinced us that we should in the future always have an up-to-date independent valuation of all our fixed assets, and we consider the fee paid you was one of the wisest outlays we ever made.

This letter is unsolicited and we would be glad to have you use us as a reference.

Yours truly,

THE SANDERSON-HAROLD CO. LTD

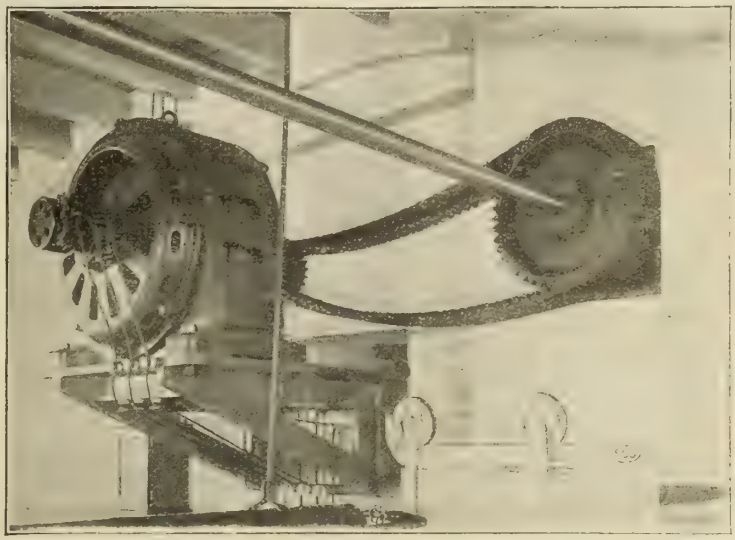
Renold Chains

For Line Shaft Driving From Motors



Convenient Reliable Efficient Durable Increased Output

This Drive Will Cost You One and a Half to Double a Similar Belt Drive in First Cost

BUT—

1. **Efficiency.** Puts 98 per cent. of the power of the motor into line shaft.
2. **Economy.** Saves its first cost in a year or two by overcoming the loss by slip in belt drives from motors.
3. **Reliability.** Adopted by the leading steam engine builders to drive the governors of the largest engines, as it can be absolutely depended upon.
4. **Durability.** The works of Hans Renold, Limited, are about half belt and half chain driven, and they find the chains outlast a couple of belts, but with the new improvements recently made will probably do considerably better than this.
5. **Saving in Space.** Chain Sprockets are 30 to 50 per cent. less in diameter, 50 to 80 per cent less in width, and it is the only drive suited to short centres.
6. The only satisfactory method where oil, moisture or heat are present.
7. **Production.** Owing to the steady positive drive, machines can be considerably speeded up, giving a larger and better product. In several large works this increase amounting to over 20 per cent.
8. We now have a number of business friends in Canada who after giving the chains a trial, are enthusiastic supporters.

English Practice in Power Distribution Around Mills

Recent Experiences and Views of English Engineers and Experts on the Construction of Mills as to Shafting, Pulleys, Etc.

By T. LINTON

Canadian readers may be interested in the recent views of English engineers and experts on the subject of gearing for works and mills, which are, so to say, focussed in the following article. The mill engine has always been a favorite subject for writers, but the mill and works gearing, including in the "gearing" all shafting, pulleys and fixings, as well as toothed wheels, has received comparatively little attention. The gearing has probably been overlooked as the engine is so very much more conspicuous and there is more of that personality about it, which all engineers like to think of as existing in their creations; the utility of the engine can also be more readily expressed in figures; something, too, must be allowed for the fact that the engine is the visible source of power; the gearing being comparatively passive, a mere agent of transmission. Whatever may be the cause, it remains true that the gearing deserves more attention than it has so far received.

Experience proves that in some English works the loss of power in the gearing is from fifty to one hundred per cent. more than in others; in some cases this great loss is due to unavoidable obstacles, to simple and direct power transmission, which are, however, absent in most other works. In the majority of cases the excessive loss is due either to a badly-designed scheme of gearing, to indifferent design of the details, or to the gearing not being in proper adjustment, or to all three. Old works are usually inferior in this respect to more modern ones. This is not so much due to carelessness or inferior workmanship on the part of the older millwrights as to the fact that the work is old and out of alignment, that brasses are in bad condition and the lubricating arrangements imperfect. Moreover, the use of toothed wheels for transmitting power very often led to awkward arrangements of shafting. In particular the upright shafts driving the main lines of shafting of the several floors through bevel gears were responsible for much loss of power.

A consideration of works gearing naturally falls under three heads. In the first place the general arrangement should be well thought out; secondly, the design of the details should be good; and thirdly, the workmanship, including the erection, should be first class. A great deal depends upon the general arrangement of the gearing. It is easy to spend money on needless complications and badly arranged transmissions, which do not produce any adequate return and which are indeed usually sources of loss of power and involve additional capital expenditure. These remarks apply more particularly to old mills in which rooms have not been arranged in relation to each other, with a view to economical power transmission. Probably the works have been extended from time to time and frequent rearrangements of machinery have necessitated corresponding rearrangements of the gearing. But with a natural desire to make use of existing arrangements so far as possible and prevented by the structural arrangements of the buildings from ever making a simple and efficient job of the gearing, the millwright has often achieved a final result anything but satisfactory. Even in quite modern English works this re-arrangement has often appreciably spoiled the scheme of gearing, although in a modern mill the arrangement of the gearing is generally so simple and also so universal in its adaptability that the effect of a re-arrangement of the machinery should not very seriously influence the gearing scheme.

The first condition aimed at by English engineers in a gearing scheme is directness. As far as possible intermediate shafting and gearing are avoided by them. Each constitutes a source of loss and although there are cases in which they are justifiable, such cases are generally exceptional. Intermediate shafts are like superfluous middlemen in business. Generally toothed wheels should be avoided and especially bevel wheels. It is true that when well made, with properly-shaped and fitted teeth, and with the wheels and shafts firmly carried and accurately aligned, toothed gearing gives high efficiencies, although scarcely so high as a rope drive, unless the shafts are very close together or are inclined at an angle to each other. In practice these ideal conditions are seldom attained, and after a few years' working the adjustments are apt to be disturbed by the wear of brasses or the drying in of timber, beams or packings, with the result that the efficiency falls off seriously. With a rope drive such lack of adjustment does not affect the drive. The ropes form a very efficient flexible coupling, provided, of course, that the usual conditions necessary in rope drives have been complied with. Besides being comparatively inefficient, toothed gears are noisy and are scarcely so trustworthy as a rope drive. Not that the gears give out before the ropes, but they are more troublesome when replacement becomes necessary and are more apt to give out without previous warning.

In modern English cotton mills the drive is almost invariably by ropes from a pulley on the engine shaft to pulleys on the main lines of shafting as a rule only one line per room is directly driven from the engine, the other lines, when there are any, being driven from the former. The loss of efficiency due to this method as compared with the direct drive on to each individual shaft probably does not exceed two or three per cent. of the engine full load, and it simplifies the rope race. Indeed, the direct drive to each shaft is seldom possible in its entirety owing to the interference between the ropes and the rope race beams and shafts. In weaving sheds it is the usual practice to drive from the engine pulley by ropes to a second-motion shaft which passes across the ends of the cross shafts in the shed, driving them through bevel gears. This construction has been evolved because the shed is usually all on one floor and the lines of the shafting are too numerous to permit of satisfactory rope driving. The present arrangement could be modified so as to drive every third cross shaft by wheels from the second motion shaft, and to drive the others from the geared shafts by means of ropes. The improvement would be doubtful except as to noise, which would be reduced. In the old days in England the engine usually drove a second-motion shaft by means of spur wheels, the fly-wheel of the engine being the main spur wheel. The drive from the second motion shaft to the cross shafts of a shed was similar to that now in use, but in the case of works of two or more floors, the separate floors were usually driven by means of an upright shaft. These upright shafts were

continually giving trouble, chiefly at the footstep bearing. Indeed, when the shaft and its wheels were very heavy as where a large works of several storeys had to be driven, the pressure on the footstep rendered the ordinary means of lubrication ineffective and the only satisfactory method, which was, however, seldom adopted, was to supply oil under sufficient pressure to float the shaft. To a certain extent the jarring of the shaft by the action of the bevel wheels assisted the lubrication, but even at its best the upright shaft was unsatisfactory. The partial extinction of the toothed gear drive has been helped by the increased shafting speeds which are now usual. Toothed gears require a very firm and rigid support, or they will set up severe vibrations, which cause undue wear and sometimes breakage. Rigidity is never so necessary as when toothed gears are employed.

The simplest scheme of gearing is obtained when electric motors are used for driving the main lines of shafting, although a modern mill where the lines all run parallel with the engine crank shaft and are driven directly by ropes off the engine fly wheel is very little more complicated. Where the electrical drive is most advantageous (apart altogether from questions of economy or production) is in an old mill or works with ill-arranged rooms. An electric cable can convey current round the most awkward corners without any more loss than would occur in a straight length. Inasmuch as it is seldom necessary to run individual departments of many works alone, it is not usual to make provision for disconnecting the various lines from the rest, except by taking off the ropes, which, although a tedious process is so seldom necessary as to justify its adoption. Since the introduction of gas engines for works, however, it has sometimes been found desirable to relieve the engine of a part of its starting load and this is done by driving on to the main lines of shafting through one or more friction clutches. The use of these clutches is, of course, common enough in factories where individual lines of shafting or departments have to be stopped and recoupled while the rest of the factory is working.

GRINDING AND GRINDING WHEELS

By J. C. Carruthers.

Forty years ago a grinding wheel was practically an unknown quantity, owing to the rough state of raw material as compared with the greatly advanced practices of turning out castings, malleables, steel, etc., an immense amount of labor was expended to finish the crude material, which is now done in the grinding department. The first wheel to attract public attention was that manufactured by what is commonly known as the silicate process. Emery wheels have also been made by what is known as the Japan or paint process. Owing to its being adapted only to certain uses, however, it is not as well known as the silicate process. It is being made to-day in an improved form and commands a very large sale, especially where a wheel is required for fine steel or tool work, and more especially for saw-gumming purposes, as fully 60 per cent. of the saws gummed in Canada use this class of wheel. It is waterproof and has extra strength to resist breakage. This feature allows wheels to be made very thin. It can be used to advantage grinding out work.

The elastic or shellac wheel is a copy of the former, but owing to it not being able to withstand heat, naturally caused when in operation, it wears very rapidly when used for any but very light work.

A modern wheel is that made by what is commonly known as the vitrified process. The high heat to which it is subjected during the process of manufacture is sufficient to burn the dross which might be used in another wheel baked at a lower temperature. Nothing remains in the wheel but cutting particles. The wheel has a very open appearance, making a fast cutting edge. It is also water and acid proof and will not deteriorate from age. It can be altered to any degree of texture. From the softest wheel which can be cut away with an ordinary knife, it can be advanced to a degree of hardness that it would be impossible to displace the grains of emery or corundum. It can be readily seen that this feature recommends this process of manufacture to him. Experience and knowledge of wheels adapted to the different classes of work is an essential asset to the manufacturer, thus enabling him to satisfy his customer by supplying him with wheels of the proper grain and grade for his particular purpose, whether it be required to grind a can opener or a car coupler.

In the process of manufacture the bond of the wheel is first selected to make the wheel of the proper grade. It is then mixed in proper proportions with the grain of emery of corundum. This mixture is thoroughly mixed and is then put in an automatic mixer where water is added. After this operation, which requires considerable time, the material is then "poured" into rings placed on "bats," the rings being of various sizes, according to the sizes of wheels required. This material, which can now be called wheels, is put in a dry room to dry by a slow heat until every particle of moisture has evaporated.

After the drying process the wheel is then taken to the shaving or turning machine where it is turned down to the exact size required and the arbor hole turned out in the centre. This course is proceeded with until enough wheels are prepared to fill a kiln. An emery wheel kiln is a very massive and substantial structure, lined with three courses of fire brick and arranged by flues and draft spaces to make an even heat in every part of the kiln. These kilns are made from 10 ft. to 18 ft. inside diameter. The wheels are built up inside in "stacks," being placed on tile and surrounded by sections placed on edge around the outside edge of the tile. The space not occupied by the wheel is then filled in with emery or quartz and the top covered with another tile. This course is proceeded with until a stack is completed and the kiln is filled. Heat is then applied by an ordinary fire in the fire boxes, which are built in at the bottom of the kiln. A slow fire is continued until evaporation ceases when the fires are forced until the heat reaches the vitrifying point, which is ascertained by taking out small test pieces through test holes in the side of the kiln. A vitrifying heat is in the neighborhood of 2200 degrees.

There are other things besides virtue that bring their own compensation. Industry, honest and unremitting, pays a handsome salary though not a cent of it be in the coin of the realm.

Halifax, N.S.,
Feb. 4th, 1909.

Canadian Machinery,
G. C. Keith, Esq.,
10 Front St. E., Toronto.

Gentlemen: I have read with interest the articles on Technical Education in the December and January issues of Canadian Machinery. I think you are to be highly commended for your enterprise in this direction. The articles are clearly written and contain practical suggestive information.

Enclosed find $1.00 for one year's subscription to Canadian Machinery. I wish you would send me the back numbers containing articles on Technical Education, and I shall be glad to forward the amount for same.

I shall be pleased to send you our report when it is issued in about two or three weeks.

Yours very truly,
DEPARTMENT OF TECHNICAL EDUCATION,
F. H. Sexton,
Director.

Apprentice School of Cincinnati Milling Machine Co.

The Need of a Systematic Method of Training Apprentices in Medium Sized Shops — The Course at Cincinnati Milling Machine Company's Works.

The necessity of systematic training of mechanics is being keenly felt by many manufacturers. President Nash, of the New York Corn Exchange Bank, is quoted as saying the following :

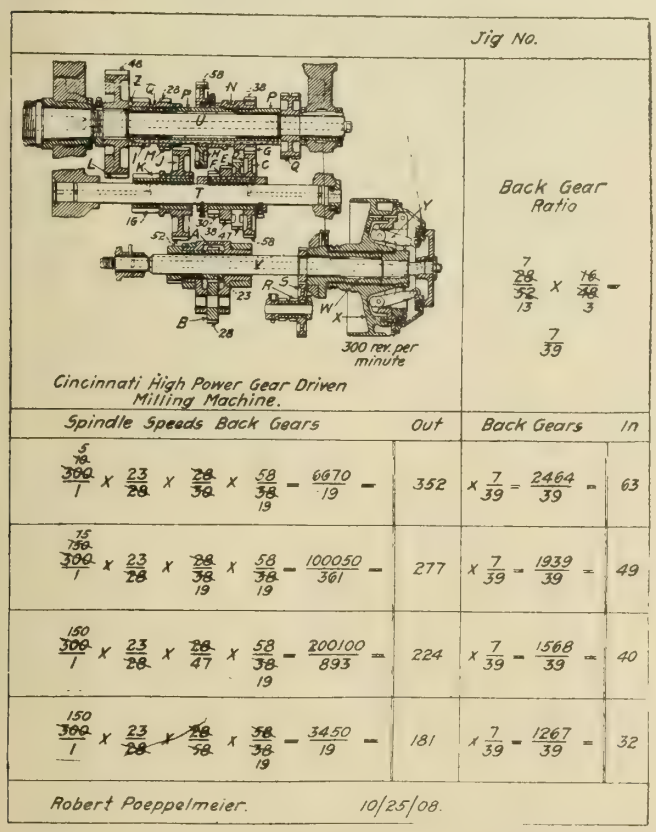
"Too many of our young men seem to lack distinction, originality of thought—I might say initiative. In a word they do not think for themselves, and make suggestions. I know how it is here in the bank. We have a number of young men who are capable, intelligent fellows. They do their work in a satisfactory way. Yet they do not come forward with new ideas. That is the thing a modern business man is always seeking in an employe. I know we are always glad to get them. We may not follow the suggestions, still the ideas are welcome."

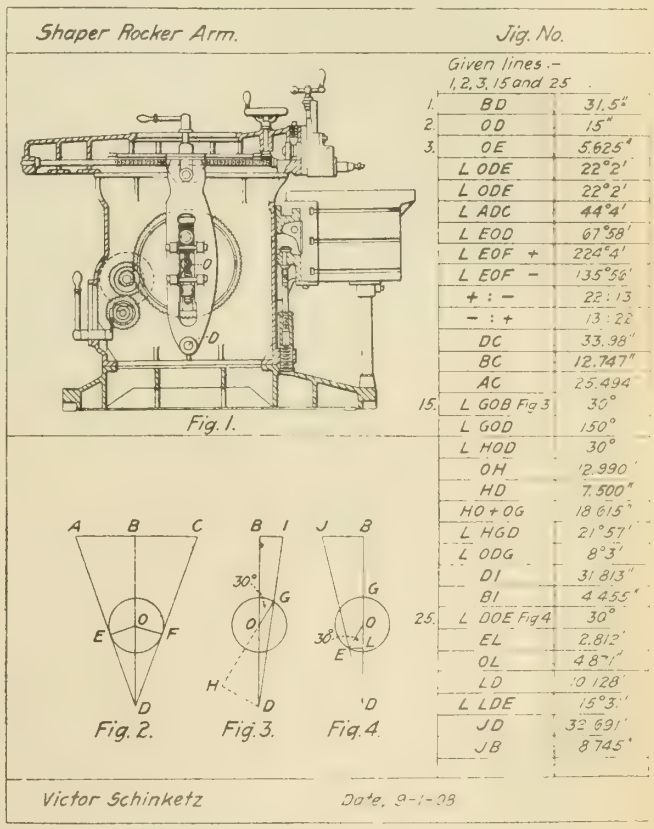
While this is not altogether true the following will show the necessity for more education for the mechanics. Education stimulates a man to think and were there a national system of technical education perhaps this account would be written in an entirely different manner.

At a meeting of the directors of the Aylmer Pump and Scales Company, held in June, 1908, it was decided to set apart the sum of $100 to be distributed among their employees, exclusive of the manager and foreman, as prizes for suggestions for improvements in their machinery and goods manufactured by them. Notices to this effect were posted about the factory, setting forth the division of such prizes, and the conditions under which they were to be awarded.

The object was to increase an interest among the men in their work, and of course the management expected to receive value in the new ideas suggested. Each competitor was given a number and those making the awards had no way of identifying the one making the suggestion. The men were called together recently and two of the directors, Messrs. W. S. Caron and J. H. Glover, after addressing them awarded the prizes. It was disappointing to find that only three had taken advantage of the offer of the company. Austin Learn secured the first prize, $25.00, John Calhoun $3.00 and Arthur Youell, $2.00. The company would more cheerfully have paid the full amount offered.

The government of Nova Scotia has already a system of technical education. This was described in the February issue of Canadian Machinery. While the other governments are slow to take the initiative, manufacturers can adopt systems of their own. The system used in the shops of the Cincinnati Milling Machine Co. is adaptable to any medium sized shop.





Jig Sheets Used in Apprenticeship School of Cincinnati Milling Machine Co.

Apprenticeship Schools at Cincinnati.

The apprenticeship school of the Cincinnati Milling Machine Co. was organized in May, 1907, and has thus been established long enough to make it possible to form an opinion about the results obtained. The apprentices work the larger part of the time in the shop under the supervision of the regular de-

*In March, 1908, appeared the G.T.R. Apprenticeship System ; November, 1908, Industrial Course at Fitchburg ; December, 1908 Urgent Necessity for Technical Education in Canada ; January, 1909, Co-operative Technical Education with Examples ; February, 1909, Recent Developments in Technical Education in Canada.

partment foremen, but receive instruction along more theoretical lines, having practical application, for two hours once a week. Forty apprentices are enrolled, divided into two classes of twenty. One class meets on Tuesday and the other on Thursday morning from ten to twelve. The boys are paid their regular wages during the school hours. A large room in the main office has been equipped with tables and chairs and is utilized as a school room.

The school has become a clearing house for shop troubles and the boy is free to ask any questions and propose any problems, no matter what its nature. Mr. Renshaw, the instructor, presents the questions so as to arouse interest, without which there will be no effort at study of any kind.

The manner of imparting the knowledge to the boys is interesting. To keep them employed continuously Mr. Renshaw designed a series of "jig sheets" which contain problems that the boy comes in contact with in the shop and that consequently interest him to be worked out by the boy himself. These jig sheets include problems in angles, in setting dividing heads, in determining the variable motion of a crankshaper ram; in fact, anything that is in the line of shop work, that is practical and will keep alive the boy's interest.

The Jig Sheets.

Two jig sheets are shown in the illustrations and are made up in such a form as to outline for the boy where to place the answer which he is required to obtain, and, in a general way, the manner in which it is to be arrived at. The name "jig sheet" has been adopted for the reason that the original instruction sheet contains simply the statement of the problem and spaces to be filled in by the student. The "jig," with its explanatory drawings, is drawn on heavy bristol board and is intended to serve as a guide from which the boy is to work—hence the name. The boy places a thin bond paper sheet over this jig and traces all the lines and the illustration on the jig, on this bond paper, the paper meanwhile being attached to the bristol board by means of paper clips. The size of the bristol board is 11 by 8½ inches, so as to permit using regular typewriter letter-size paper for the tracing. When the boy has traced the jig onto the letter paper, he carries out the required calculations, placing the results or the whole calculation in the spaces provided. The method employed not only gives the boy an opportunity of acquiring the habit of neatness in copying from an original and an ability to copy simple drawings, but it also provides a neat and permanent record of his work.

Another important feature of this method of instruction is that there is no necessity of a definite outline of a complete course which is likely to fail to arouse the interest of the boy. On the contrary, each boy can be given a problem to work on which has some connection with his regular shop work, and his interest is thereby stimulated. Individuality is given full play, and the boy is permitted to select for himself out of a list of jigs the one that interests him, after which the instructor sits down beside him and endeavors to explain the principles involved. Should the problem require more knowledge of fundamental mathematics than the boy as yet possesses, it gives a good opportunity to instruct the boy in pure mathematics without making it tiresome or wearying to him, the boy realizing that the mathematics he is being taught are absolutely necessary for the solution of the practical problem which he has selected for himself. Thus, for instance, it was found that a boy who took but little interest in exercises in the division of decimals, worked contentedly for one full month carrying out divisions to six decimal places, calculating the angle of tapers, when the length and the diameter were given and the tangent for the angle required.

The Cincinnati public library has added a circulating library for mechanics and about sixty volumes selected by the instructor are distributed among the apprentices.

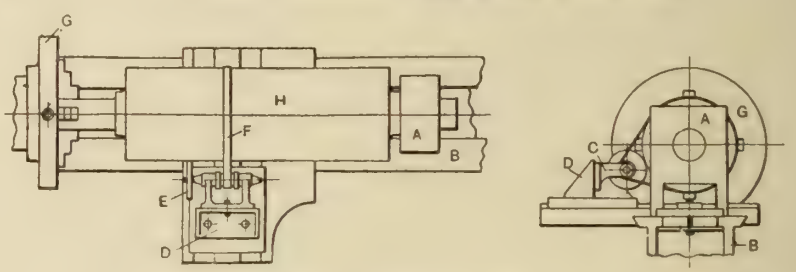
The co-operation of the public library has been valuable in that many books particularly adapted to apprentice education have been purchased by the public library since the inauguration of this apprenticeship school. This part of the scheme could be easily carried out in Ontario as the idea of circulating libraries for mechanics is already being carried into effect, as described in February Canadian Machinery.

Mr. Fred Geier, President of the Cincinnati Milling Machine Co., takes a personal interest in the apprenticeship school, receiving reports and information concerning each individual at regular intervals, and this has had the effect of making the boy feel that if he is successful and makes progress, his employer will know about it and take a direct interest in him. This feature is very valuable and of great importance in creating ambition and a desire for progress. The co-operative system of technical education develops a better understanding among all concerned and the advantages received from such a system will reward the manufacturers.

GRINDING CHILLED ROLLS.

By Alfred Strong.

A pair of chilled rolls 3 ft. 9 in. long by 15 in. diameter came in to be ground recently. We had no tackle for such a job, but got over it in the way shown in plan Fig. 1 and end view Fig. 2. The roller was mounted in the lathe, chucked one end, and the other end run in its own housing A, mounted on the lathe bed B. It was run at a good speed. We took the grinding head C from a small grinder in the tool shop, and mounted it by means of an angle plate D to the slide rest, the emery wheel E being driven by the belt F off the roller itself. The slide rest was driven by the self-act in the ordinary way. G is the lathe chuck, H the roller.



Grinding Chilled Rollers.

This makeshift may be known to some of your readers, but we have never seen it before, and as it helped us a lot, we thought it might help others.—Mechanical World.

ACTION OF SAND BLAST.

In a discussion presented before the A.S.M.E. semi-annual meeting it was stated that strips of seven materials, mounted on a board and subjected to the uniform action of a sand blast for 45 minutes, show the following relative abrasive-resisting qualities, rubber belting being taken as the standard: Rubber belt, 1; rolled-steel bar, 0.66; cast iron, 0.28; balata belt, including gum cover, 0.2; woven cotton belt, high grade, 0.16; stitched duck, high grade, 0.13; woven cotton belt, low grade, 0.06 to 0.11.

He who trusts to luck is mighty lucky if he doesn't make a miserable failure of life.

Lathe Attachment for Turning and Boring Odd Shapes

Derrer Lathe Attachment for Turning Multi-Lobe Shapes with Some of Their Applications, Including Oval Shapes for Taper Drill Sockets and Shanks.

A lathe attachment used for turning and boring odd shapes is being placed on the Canadian market and is the invention of a Canadian, Harry Derrer, superintendent of the Algoma Iron Works, Sault Ste. Marie.

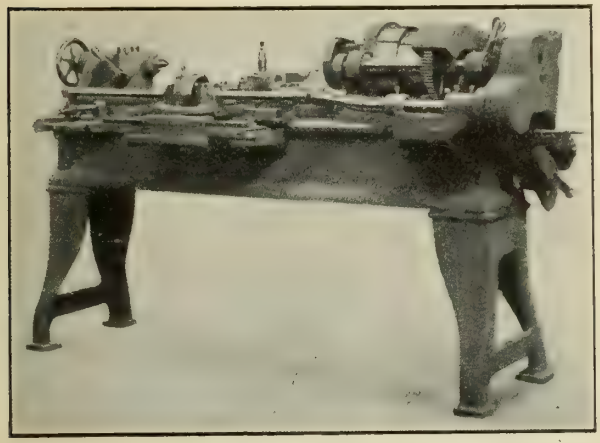


Fig. 1.—Lodge & Shipley Lathe Fitted with the Derrer Attachment for Turning and Boring Ovals and Multi-Lobe Shapes.

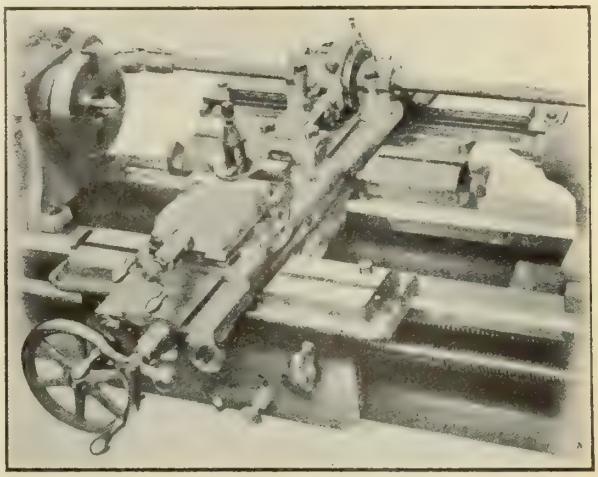

Fig. 2.—View of Lathe Fitted with Oval and Multi-lobe Turning and Boring Attachment, Showing Connection of Cross-slide with Eccentric.

A lathe built by the Lodge & Shipley Machine Tool Company, and equipped with a Derrer attachment for turning ovals and other odd shapes, is shown in Figs. 1 and 2. The device consists of a shaft carried in bearings at the rear of the bed, connected on one side by change gearing to the spindle, and on the other by a telescopic shaft to an eccentric on the cross-slide, the eccentric being arranged to reciprocate the tool-post in unison with the rotating of the spindle, thus producing the form desired.

A shaft may be turned square, oval, eccentric, etc., by changing the gears between the lathe spindle and the attachment. Thus gears are arranged in the ratio of 1 to 1 for eccentrics, 2 to 1 for ovals, 3 to 1 for 3-lobed cams and 4 to 1 for square sections. Increased ratios may be used for polygons of greater numbers of sides. The eccentric is double, the inner and outer members being rotable on each other so as to vary the throw at will from zero to ½ inch. A graduated disk is provided showing the throw obtained. For special work special eccentrics may be provided for any desired travel of the slide. Solid eccentrics (not adjustable) are substituted for the arrangement described above for producing work in quantities such as oval taper drill sockets here described.

The tool-post is mounted on a supplementary slide, dove-tailed to the carriage, and under the control of the taper attachment. This supplementary slide has cast to it brackets for the bearings of the sleeve on which the eccentric is mounted. The eccentric rod reciprocates the tool-slide, on which the tool-post may be adjusted to the diameter of work required. The main cross-slide screw operates the supplementary slide.

The lathe may be run as an ordinary engine lathe, and the taper attachment may be used for round tapers by disconnecting the driving shaft of the attachment on the back side of the lathe from the spindle. For plain, straight turning the block is disconnected.

The builders of the Derrer patent claim that the device is applicable to the making of drives of all kinds. By using the squared design with the ends of the shafts tapered, a square positive coupling drive is procured. The hubs of gears may be bored to a square outline to fit correspondingly square turned shafts. Milling cutters, shell reamers and other tools may also be fastened to their arbors in a similar way.

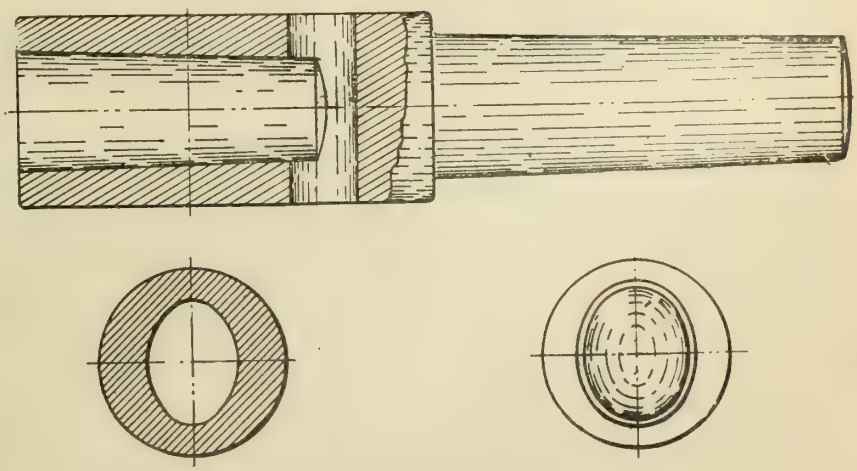

Fig. 3.—Oval Taper Socket Showing a Section Through Socket at Line and End View.

One of the products being placed on the market as a result of the lathe attachment invention is a line of oval taper drill sockets. The idea is to overcome the breaking of the tong on twist drills under heavy service.

The taper shank of the twist drill is oval in section throughout its length, and fits accurately a corresponding taper oval hole in the socket. When so made, there is no way for the drill to slip, the only possible accident being the breaking of the drill itself, due to an over strain. Fig. 3 shows a sectional view of the oval taper drill socket.

A standard on all the tapers of three-eights of an inch to one foot and also a uniform standard of oval. In turning these a solid eccentric (non-adjustable) is used.

The lathe attachments and drill sockets are being placed on the Canadian market by the Elevator Specialty Co., Toronto.

Repairing Wrecked All-Steel Railway Freight Cars

A Process Which Reduces the Cost of Repairing Wrecked and Twisted All-Steel Cars Which Will Greatly Reduce Cost of Maintenance.

Fifteen years ago the first all-steel railway freight car was brought out in the United States, but not until about three years ago were they built in Canada. However, although Canada was perhaps a little slow in beginning their manufacture she is right to the forefront in the repairing of twisted, wrecked cars. The great advantage of steel cars is, of course, their lasting qualities, providing they do not figure in collisions or other wrecks. When these unfortunate events occur the cars generally present a most dilapidated and tangled appearance of bent and twisted steel, which to the casual observer is fit for nothing but the scrap heap. The straightening of these twisted cars has been an expensive and tedious bit of work, but developments have occurred which simplifies the operation.

Fig. 1.—Steel Freight Car Before Repairing.

Fig. 1 shows a car which seems only fit for scrap. A new car to fill the place of this one would cost about fourteen hundred dollars. Fig. 2 shows it repaired at an actual cost of only one hundred and sixty dollars. This price includes all labor, fuel and any new parts. The new parts consisted of splice pieces for the sills, angles, plates and rivets. The angles are small short pieces and the plates merely patches to holes in the original plates.

In this particular case the apparatus used in repairing included a small, portable oil heater, a portable oil rivet forge, two small 9-in. jacks, two 24-in. lever jacks, two chain blocks, air hammers, dolly bars and sledges. All of these take up very small space in a wrecking car and are used right on the

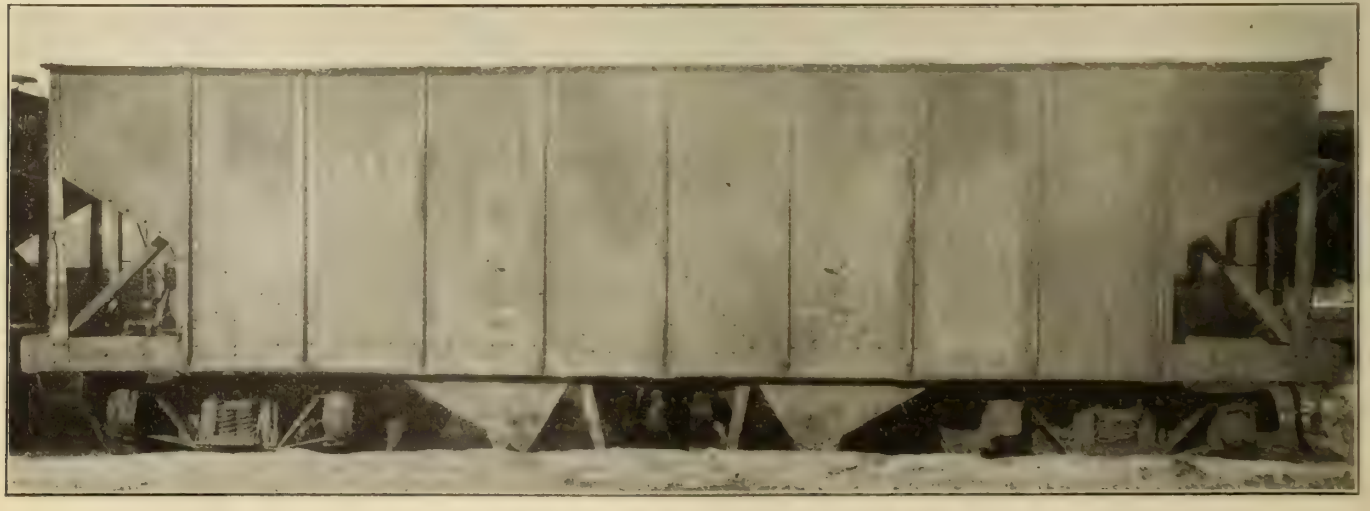

Fig. 2.—The Steel Freight Car Repaired.

spot of the wreck wherever an engine can go to supply air.

Fig. 3 shows a F. Hyde & Co., "King" oil heater in operation, heating a sill to be straightened. In the photo O is the chamber containing the crude oil fuel, G is the chamber in which the oil-gas is generated and from which it is piped to the burner, which is manipulated at the will of the operator, who plays it over the part to be straightened. A is the air pipe.

In this photo the method followed can be clearly seen. A screw-jack is placed under the piece, which in this case is a centre sill and was bent 6 in. with a double offset. The sill is chained at each end to the rails and is straightened by means of the jack.

A Canadian railroad has recently been making experiments with this method of repairing, and have repaired 25 steel cars at an average cost of only thirteen dollars and fifty-five cents per car, including all material and labor. The repairs consisted of bent doors, end sills, centre sills, sides, etc. The cost of the badly wrecked car in Fig. 1 is included in this average.

Fig. 3—Repariring Sill of Wrecked Steel Car.

IMPROVEMENTS IN METAL CUTTING.

By Samuel K. Patterson.

The day when in large shops the questions of tool shape, cutting speed, and feed are left to the individual operator, or to the shop foreman, who decides them from his own personal experience, or by the rule of thumb method, with results that have been heretofore acceptable, is fast drawing to its close. The shop owner who is alive to the possibilities of improvement is embracing the opportunities for increased output, which is offered today through a scientific knowledge of conditions, obtained as a result of experiments in recent years. It is a regrettable fact, however, that the average shop-owner has not as yet fully accepted these conditions, and is still satisfied to continue under old methods and ideas.

While it is true that vastly important and gratifying experiments have been carried on for a number of years, notably those of Mr. Fred W. Taylor and his associates, and that various methods and formulas have been evolved therefrom that are of the utmost value. It is also true that the varying individual conditions extant in the numerous small shops call for individual experiment and recording. The author adds his plea for the development and compilation of experiments by the average small shop and a more extensive and general knowledge of the use of the scientific formulas and gauges which have been developed as a result of past experiment. Real progress beyond what has already been done, in this field, is largely dependent upon the accumulation of endless records of operating conditions through the co-operation of a large number of operators having a thorough knowledge of scientific progress up to the present time. Not only does this scientific influence cover the actual cutting operation of the machines, but it is extending more or less into the entire shop and may be felt in all operating conditions.

Simplicity is gradually becoming the key note in the modern shop, and tool types are being used with standardized shapes for all edges of cutting tools. The unusual shapes and unscientific designs of a few years ago are disappearing, with the realization that scientific knowledge is becoming more and more an essential detail necessary to the successful progress in this field of labor. Specialization of duties is also obtaining recognition, and in the best developments along these lines, a single man, or sometimes several, takes entire charge of the tools, their preparation and maintenance, while the duty of another man, or set of men, is the maintenance of pulleys, shafting and belting. Money so expended, has proven to have been well spent, in increased efficiency and decreased cost of renewals, etc. Such specialization is not nearly so general in the small shop, nor even the average large shops, as it should be, and yet the increase is fairly steady. There are records where in small shops, and with pronounced success, scientific development has been carried to an extent that might be considered extreme even for large shops.

Metal cutting has as yet a long way to go before reaching its final stages, owing partly to the large amount of uncollected material which must be gathered and classified, and further, to the large number of variables which govern the determination of the best operating conditions, and the varying effect of these on the data necessary for most efficient operation. The machine itself, in construction, and purpose, and its operation, the tool and its ability to stand up, and other properties, and lastly, the material to be cut, are the three prime factors involved in metal cutting. Several variables are possessed by each of these primal units, which in turn react upon the variables of the other units, producing at least a dozen variable factors to be considered in a determination of cutting speed, rate of feed, depth of cut, etc.

Primarily the results are dependent upon the character of machine, whether lathe, planer or milling, and secondarily upon design and character of work required,—whether it shall be used only for roughing, or for ordinary, or for very fine finish. Similar conditions, differing only in numerical values, hold for most of these machines, but the ones most generally known are those for lathe operation, and are probably more universal in application, while not of more importance, and are therefore more far-reaching in results. Fundamentally the same problems, though in radically different forms, are met with wherever metal cutting is encountered. A study of conditions generally existing, has given results which, while far from complete and only partially investigated, have been such that in roughing work, total increases of over 100 per cent. are very common, for a given machine, in many plants. So many factors are to be considered in the determination of depth of cut, cutting speed and rate of feed that under these conditions experience counts for almost nothing, and the oldest and most experienced hand will be nonplussed to see vast improvements made in the same work by a green man, apparently just out of his apprenticeship.

For those who are interested and contemplate some such developments as pertaining to metal cutting, a brief review of the various factors, and their

relation to the work, will probably be of more than passing interest. As an illustration, take a case of ordinary roughing on a lathe, and the operator's first queries will be, what tool shall I use? What cutting speed and what feed? Personal experience, or often the experience of the foreman was formerly depended upon to answer these, and valuable time and power consumed before a satisfactory result was obtained. Often indeed the operation was so prolonged and delayed by frequent changes and shifts that the result was expensive and by no means perfect, while the entire operation was inefficient and erroneous, as a scientific study of the involved factors has proved. In the answers to the above usual questions, and relating to and dependent upon them and each other, are numerous factors, some of which, not necessarily in the order of their importance, briefly would be:—Quality of metal to be cut, diameter of work, depth of cut, elasticity of material and tool, shape of cutting edge, its clearance and angles, chemical composition of steel from which tool is made, treatment of tool as regards heat and temper, the use of water to cool tool and work, amount of work required, duration of cut, pressure of shaving on the tool, changes of feed and speed possible, construction of lathe, effect of driving and feeding power on such construction.

These, therefore, are a few of the factors, whose influences are so complicated and related to each other that the rule of thumb man who attempts to adjust them from his own experience or knowledge, is often apt to go far wrong and in fact to operate at a small percentage of the efficiency possible under more intelligent and accurate manipulation. While there are in use to-day a number of slide rules and gauges to determine depth of cut, etc., their use is more or less arbitrary, and lacking in a knowledge of the principles and theories of their construction and the result has often been a decreased production. If a gauge is to be of any value at all, it should be constructed along mechanical lines, and by experiment be specialized to a particular machine, as so many varying conditions exist, and best results are thus obtained.

As an outcome of experiment with these varying factors theories have been established and facts proved that have in a measure completely upset the old and brought forward a new practice.

To illustrate, it is known to-day that a round-nosed tool can be run under given conditions at a much greater cutting speed and heavier feed than was at one time supposed possible, the old axiom of slow speed and coarse feed being superseded by high speed and coarse feed, and consequently a round-nosed tool will turn out much more work than the old diamond pointed ones.

Again, development in tool steel has reached such a point that on account of this improvement alone the cutting capacity of a given machine has increased as much as 100 per cent., while with a general knowledge of the factors much further progress and efficiency may be expected. This may not be confined only to the better actual preparation and use of tools, but the discovery and adoption of still more efficient ones.

There has also been a considerable change in practice in regard to the cooling of tool and work; whereas a fine stream of water or practically none at all was formerly utilized, it has been found that heavy streams, poured directly upon the chip at the point of removal from the steel forging by the tool, results in an increased cutting speed of from 30 to 40 per cent. Primarily this water is a cooling device, but, as it is generally mixed with soda and has some oil in it, which forms a fine emulsion, it undoubtedly aids the cutting process.

Briefly, therefore, these are some of the results of careful experiment and investigation, and together with many others, form a scientific basis on which the progressive shop-owner or foreman can work, and which, with a proper understanding of principles and factors, will bring higher efficiency and greater output.

NEW METHOD OF CUTTING OUT METAL SHEETS.

The punch illustrated below is specially constructed to cut out metal sheets into any desired shape, templates, sweeping boards for foundries, and all kinds of curved shapes required in everyday shop practice.

It is not a machine for repetition work, such work being more suitably done by means of special dies and punches, but it is essentially a machine for use when only one or two pieces of a similar shape have been required.

No. 1 machine has a gap of 12-in. and is suitable for plates up to $\frac{1}{8}$-in. thick. No. 2 machine, shown in Fig. 1, has a gap of 24 ins. and is suitable for plates up to $\frac{1}{8}$-in. thick.

The machine runs at high speed, 300 revolutions for the No. 1 machine, and 250 revolutions for the No. 2, and is furnished with a punch of a special shape, as shown in Fig. 2. The cutting edge of the tool is in front and the back of the punch is prolonged to act as a stay. The cutting edge can be set in any direction to suit the work.

The stroke of the machine is slightly greater than the thickness of the piece to be cut and the movement is obtained by a special eccentric motion.

The end or tail of the punch of the machine works in a die which is placed

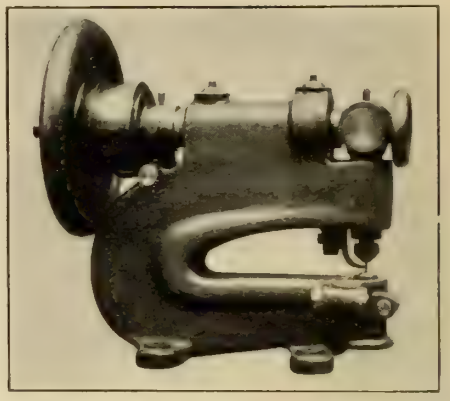

Fig. 1.- New Method of Cutting Out Metal Sheets.

in the anvil of the machine just below the punch and the tail of the latter is long enough to work up and down in this die throughout the stroke, so that it affords a very efficient stay for the punch.

The die above mentioned can be raised or lowered by means of a screw to enable the operator to pass a sheet of metal under the punch, so he may begin to cut in a hole in the middle of the plate.

The groove left by the punch acts as a guide and the operator has simply to

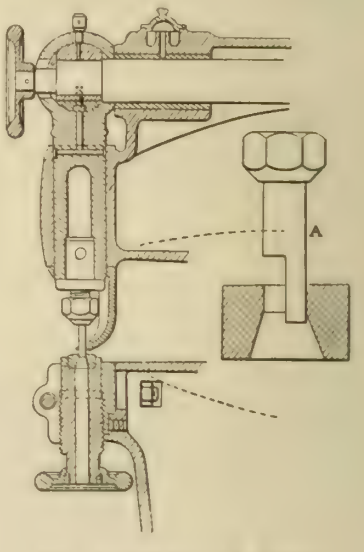

Fig. 2—Details of Punch.

place the plate under the punch and turn it slightly to obtain any desired shape.

The above machine is made by the Societe Anonyme des Etablissements Ph. Bonvillain & E. Ronceray, 9 and 11 Rue des Envierges, 17 and 19 Villa Faucheur, Paris.

Accurate Cost Keeping as an Aid in Manufacturing

Third Article of a Series on Cost Keeping in Which the Paying and Premium Systems in Use by the Canadian Locomotive Company, Kingston, are Described.

Every two weeks the timekeeper makes out the payroll shown in Fig. 1. Under "No." is entered the check numbers in order, as 101, 102, 103, etc., and these are written on both sides of the sheet for facilitating the work of the clerks. The day-work hours go in the columns under "hours." These

No.	NAME	OCCUPATION	M	T	W	T	F	S		M	T	W	T	F	S		Total Hrs	Rate	Premium	Total Amount	Stoppages		No

Fig. 1.—The Fortnightly Payroll.

are entered for each day and totalled, this total number being entered under "total hrs." Under premium is entered the amount awarded the workman for efficiency. The method of arriving at the amounts due each workman is described in this article. The total amount is then entered under that heading. A blank space is left in the centre for binding purposes, the sheets being filed away afterwards for reference.

A receipt is required from each mechanic and this is made out from the payroll. They are distributed among the men before the hour of payment. If there is any error the workman must notify the foreman immediately. The receipt must be presented at the wicket as the men file out.

The men line up in order of number and the clerks who have previously counted the money into envelopes, give out the money in return for the receipts. This system has been found to work very satisfactorily.

R. J. Read

Fig. 2.—Rate Card.

Rates of Employes.

The rates are arranged so that no time will be lost copying them into the shop statement and labor slips. Plain white cards 2 in. x 3 in., shown in Fig. 2, are arranged according to numbers in a small box.

It is then easy for a clerk to go through the box and write out the rates on his pay roll and other lists. When the time-keeper gets an order from a foreman for an increase, the rate may easily be changed without destroying the card.

Employe's Record.

In the office is a record of all employes, both past and present. Two files are kept and new men are entered up immediately on a card, as shown in Fig. 3. A clip is used on the letter denoting his name, and the cards are filed alphabetically. All the spaces are filled in and changes of rates of wages, etc., are filled in from time to time, keeping the record complete.

If an employe leaves, the reason is written on his card, which is then transferred to that of past employes. These also are filed alphabetically, so that if a man again seeks employment the company knows exactly at what work they can place him advantageously.

Premium System.

The time limit on work from which the amount of premium is found is given under the direction of the chief cost clerk, who has had several years' experience in the work. If the pieces on which machining is to be done are different from any previously made, reference is made to the drawings. These are compared with those on which a time limit has been set, and the time given accordingly. Time is allowed for setting up the work, changing and machining. The workman who saves an hour is paid for that hour at a flat rate that the company has decided upon. The mechanics as a rule make quite an addition to their regular wages by taking advantage of the premium system.

When a workman begins a new job the time limit is written in a book provided. When a job is finished the card shown in Fig. 4 is filled out. If the contract is a large one, the mechanic is allowed to divide it. For instance, if a man is fitting twenty con-

necting rods he is allowed to put in a premium card when five are completed.

A reference to Fig. 4 will show the working of the premium cost card. The card contains the man's name and number. If there are twenty crosshead shoes to be fitted, "20 crosshead shoes" is inserted in the space at the top of the card. The card is filled in as shown at Fig. 4. The amount of premium is entered opposite his name in the pay roll. If there are a number of jobs on which a premium is to be paid, the workman sends in a fortnightly

In the April issue will be given the system followed in the cost department to obtain the summary cost of labor and material.

The familiar illustration of the dripping water proves that perseverance will overcome almost anything. When a man gives up, it simply indicates that the resistance was stronger than his own perseverance.

Recent Developments in the Manufacture of Steel

Dr. Eugene Haanel, Director of Mines, Gives Preliminary Report of Experiments in Sweden — New Tool Steels at Sheffield, Eng., and Toronto.

Dr. Eugene Haanel, Director of Mines, has returned from a visit to Dumnarfvet, Sweden, where he inspected a new electric smelting process. As a result he is confident that the new method is a commercial success. Ontario has no coal and with large water powers and enormous supplies of iron, the commercial success will mean much to Canada.

In his preliminary report on the experiment at Sault Ste. Marie in 1905 and 1906, Dr. Haanel stated that the furnace there tried needed certain modifications to render it a commercial possibility. This report awakened lively interest in Sweden, where the conditions are similar to those of central Canada. A company was organized, able young engineers were put in charge, work was carried on for a year and a half with eight new furnaces constructed according to the results of the Canadian experiments described in Dr. Haanel's report. As soon as the company had their plant properly established and in complete working order Dr. Haanel was invited to inspect them.

The new furnace is very similar to a blast furnace in which the tuyers are replaced by electrodes. A three-phased current is employed and about 700 horsepower delivered to the furnace, which is large enough to employ fifteen hundred horse power.

Dr. Haanel assured himself that the furnace met his expectations as a solution of the problem of construction an electric furnace on a commercial scale. The furnace worked well, the electrodes required no regulation, not having been moved for five days. The time occupied by the experiment was too short to ascertain what the output would be.

In addition to this work, the Dumnarfvet works have invented a steel furnace in which a three phased current and two electrodes are used, the bottom of the furnace furnishing the third electrode. The special advantage of this is that the three-phase current produces a rotation of the bath in a vertical plane, thus bringing new material continually into the slag line for purification.

New Steel at Sheffield.

Seeking a way out of litigation which threatened English manufacturers of air-hardened steel from the Bethlehem Steel Company of America, who claimed the patent rights, a new steel has been placed on the market by Jonas & Colver, Sheffield.

The steel can be hardened in oil or paraffin equally as well as in water. Experiments show that a tool made of the new steel worked on very hard material for a day and a half without re-grinding.

Steel Direct From Ore.

A new process of making tool steel from common and low grade ore and old metal is being experimented with at the machine shop of John Whitfield & Son, Toronto, and if successful a syndicate may be formed to take over the process and develop it on an extensive scale. A rusty wire nail transferred into a razor is one of the exhibits shown as a result of this process and chisels have also been made. The plan is to utilize the Lash process, a method owned by Buffalo parties. A plant will be located near a waterpower in Ontario, where electricity can be developed, which would give heat sufficient to change the ore into steel without sending it through the pig iron stage and Bessemer process. The ore is crushed and run through a refining process, mixed with carbon, sawdust and fluxes and then made direct into steel, thus doing away with the middle treatment.

The man who can't and the man who can but doesn't, jog along together.

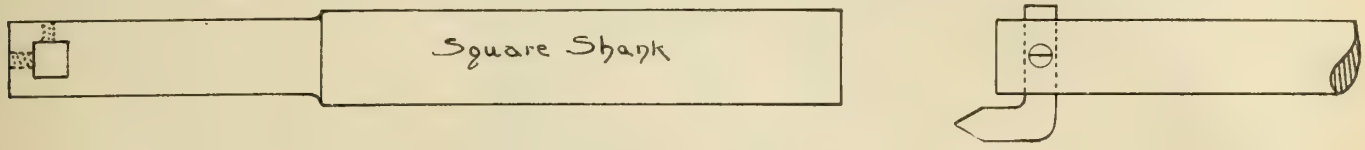
MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

HOW THESE RINGS WERE TURNED

By E. S. Cooper.

In a small country shop they built a machine that required four wrought iron rings about 3in. interval diameter, made of ⅝ in. square stock, and finished all over. These were threaded inside 8 threads per inch and had never been made more than 2 sets at a time so the question of improved tools had not been important.



How the Rings were Turned.

An unexpected order for 6 machines caused a sensation in the shop and stirred things up to some extent. These rings had always been made in a heavy lathe which had an English type of tool holder, splendid for heavy work, but rather cumbersome to handle on smaller jobs where it was necessary to change the tool frequently.

For this job the lathe hand took a 1½ in. square bar of iron about 10 in. long he found in the scrap heap, turned the corners off it for 4 in. back from one end, put a ⅝ in. square hole through it about ⅝ in. back from the end, and drilled and tapped it for 5-16 in. set screws in the end and top, making the tool look like Fig. 1. This was a good heavy tool holder that was handy for lots of jobs and should have been made long before it was. Square steel made the tools and the idea was that they should do all the chuck work so that the holder would not have to be changed during the entire job.

The first operation was to force off the ring and this was done with a tool as shown in Fig. 2. As you will note, the tool projects beyond the end of the bar for facing the rings.

Ordinary straight boring tools were used for turning to the proper internal diameter for threading and the back of the ring was faced off as close up to the chuck jaws as possible. This was easily done by grinding a clearance on the back of the ⅝ in. tools and any little burr left was ground off on the emery wheel. The reason for facing off the back while in the chuck was that it allowed 4 rings to the screwed onto a mandrel together and saved a lot of time on the outside finishing operation. The edges of the bore were well bevelled off so that when the chasing of the thread was done there were no burrs projecting over the sides. This made less threading and left the faces clean so they came together properly on the mandrel.

The use of these tools made a saving of 50 p.c. on the time of the job as done before, partly due to the quickness of changing the tools over the old method and partly to the stiffness of the tool holder over the light ordinary tools as used before.

MILLING ATTACHMENT FOR LATHE.

By Ethan Viall.

In reading Arthur Baldwin's article under the above heading in the December number I was reminded of an attachment a friend of mine made for the cross slide of his lathe, which for some work is, I believe, handier than the one described by Mr. Baldwin.

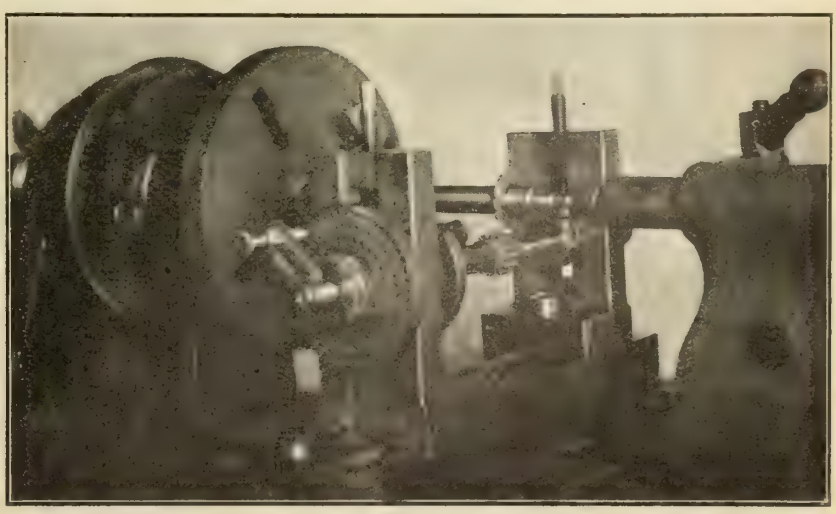


Fig. 1.—Milling Attachment for Lathe.

If the attachment were used on a lathe with a tilting cross slide, like the Read, it would be better than on the style of lathe shown in Fig. 1, but one must use the lathe at hand, so my friend has to depend entirely on the capstan screws for height adjustment.

Fig. 2 shows this attachment in detail. A is a knurled nut used to lock the index arm spindle. B B are nuts used to lock the sliding centre heads. C is the tail centre, which is so made as to slide in or out, and is locked in position by set screw D. E is the nut which engages the cross slide screw.

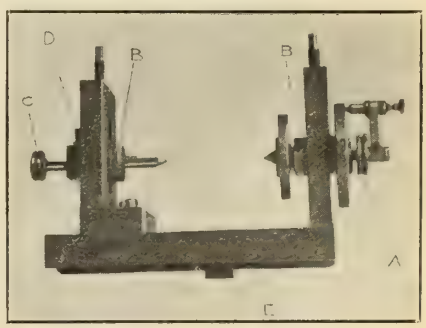

Fig. 2.—Attachment in Detail.

With this attachment various sized gears or cutters may be made with very satisfactory results.

RAILROAD SHOP WORK.

The process of crude oil welding has been in successful use in the Bellefontaine shops, for some time. The first process followed in these shops was to use one burner, but it did not give very good results. Two burners were then used, which welded locomotive frames satisfactorily in every way.

Fig. 1 shows how frames are prepared by the machinist, and Fig. 2 shows the small brick furnace used in welding frames.

Forming Dies.

Mr. Mayer, of the Michigan Central Railroad, at Detroit, furnished descriptions of several forming dies to the International Railway Master Blacksmiths' Association. These are illustrated in Figs. 3 and 4.

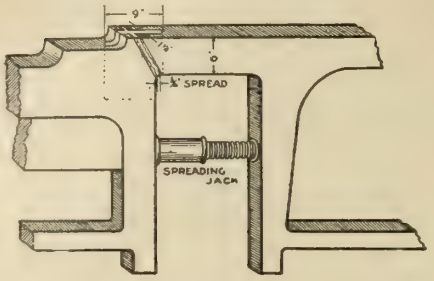

Fig. 1.—Crack Opened for Filler.

Fig. 1 shows in detail a die for the making of 5/8-inch round hand holds or grab irons on the 1½-inch Ajax upsetting and forging machine. The pear shape of the upset, under action of the punch, can be seen in the dies at A, B and C. These dies are made of cast iron and are put in service just as they come from the foundry, without machining, and are good for from 10,000 to 12,000 grab irons.

Fig. 2 is a bolt-heading die which can be applied to any style of bolt or forging machine from 5-inch to ½-inch. When this die was first installed, steel was used in its construction and 5 to 6,000 bolts could be made on one pair. After changing the style of this die, making the side blocks adjustable and using cast iron, 81,000 7/8-inch bolts were made with one pair and 100,000 ¾-inch bolts with another, all of these dies being good

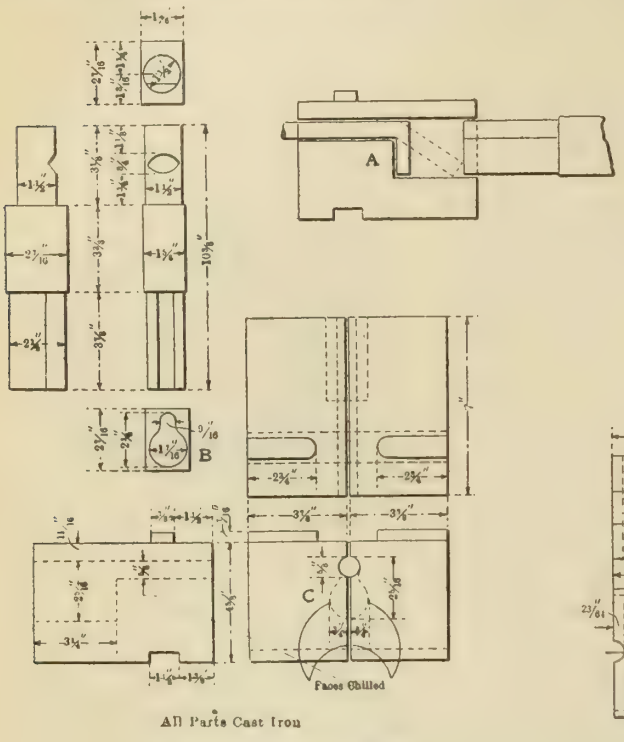

Fig. 3.—Upsetting Dies.

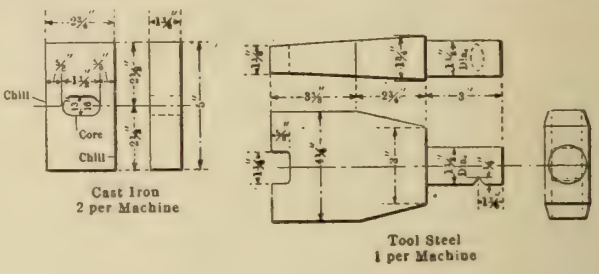

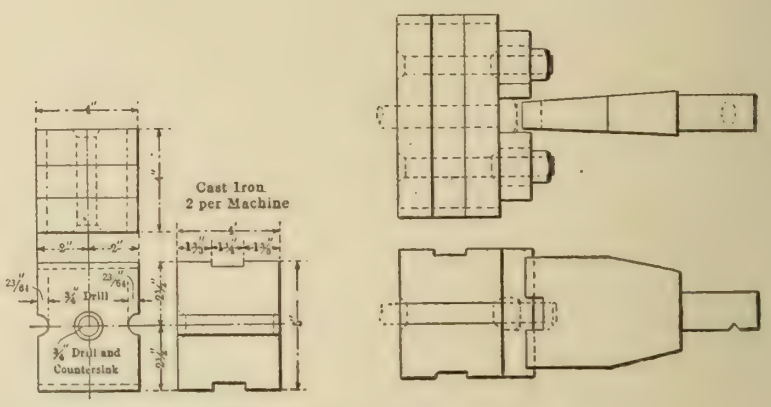

Fig. 4.—Bolt Heading Dies.

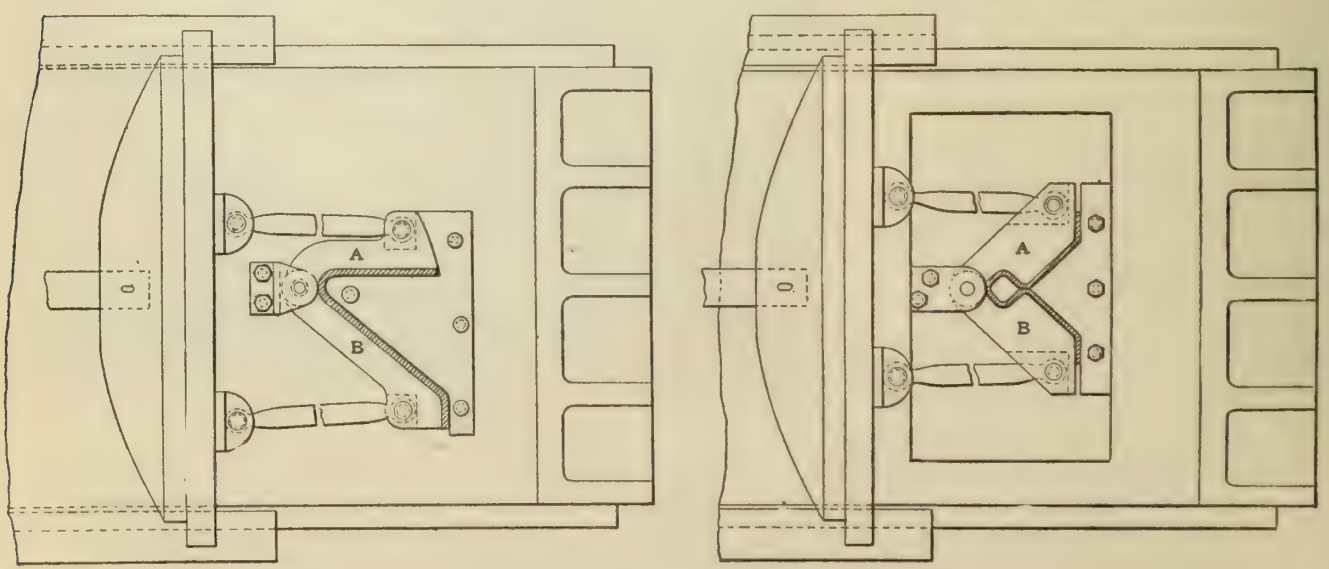

Fig. 5.—Two Bending Dies.

for more, as none of them had been in the machine shop for repairs.

Fig. 3 shows in detail a former for bending running-board brackets for box and refrigerator cars, used in the Pennsylvania Railroad car smith shop at Al-

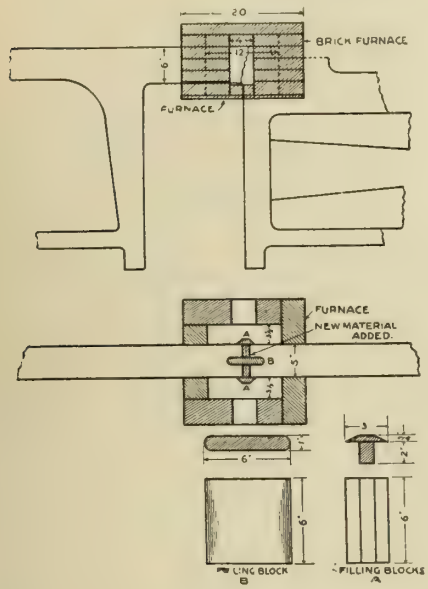

Fig. 2.—Plan of Furnace and Filling Pieces.

toona, Pa. These brackets are made from ½-inch x 1½-inch material, cut 22½-inch long. With wings A and B of former standing open, a piece of material is placed in position and each motion of the machine forms a complete bracket.

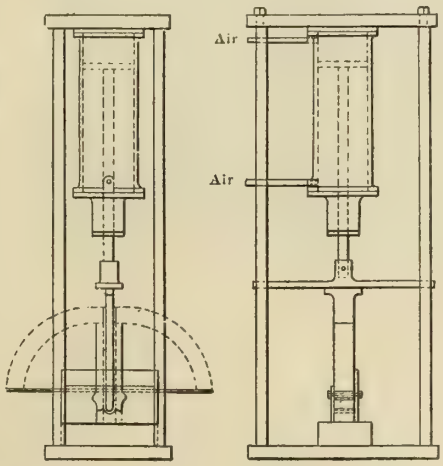
Fig. 4, shows in detail a former, for bending brake-shaft brackets for box cars. These brackets are made from ⅜-inch x 1½-inch. material, cut 14¼-inch. A piece of this material is placed in position, wings of former A and B standing open, the process being the same as described in connection with Fig. 3.

These formers are used on a temporarily constructed air machine which is described in detail in Fig. 5. It will be seen from this line cut that this makes a very cheap bending machine, which almost anyone can use, providing a supply of compressed air is at hand.

These dies will suggest methods that may be followed by Canadian shops. In the railroad shops, agricultural works, and the many other lines of manufacturing the working of wrought iron is important. These devices illustrate the methods of making duplicate wrought iron parts.

PARALLEL BLOCKS.

The blocks illustrated are of cast iron and are 3x6x7 in. They are cast with four sides. One stud clamps the block and the work to the boring mill.



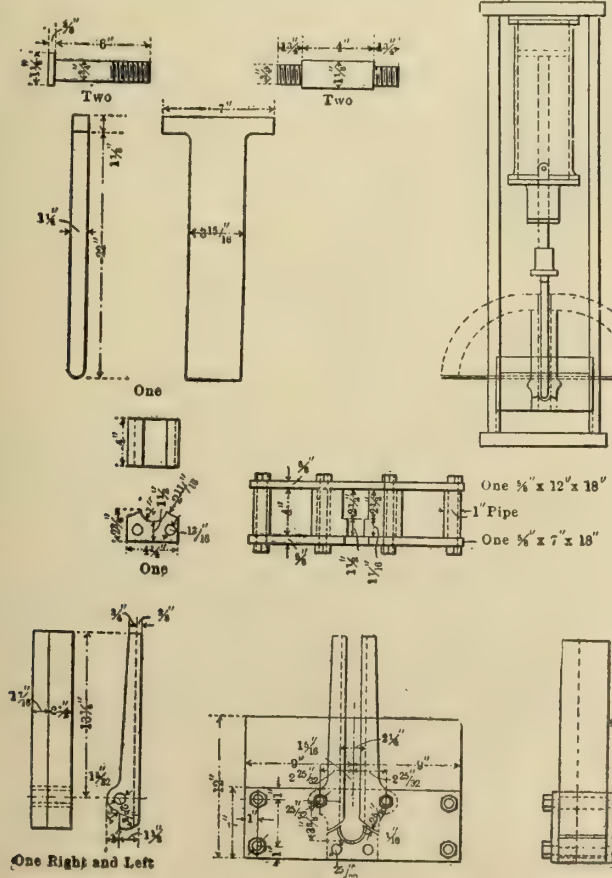


Fig. 6.—A Cheap Forming Press.

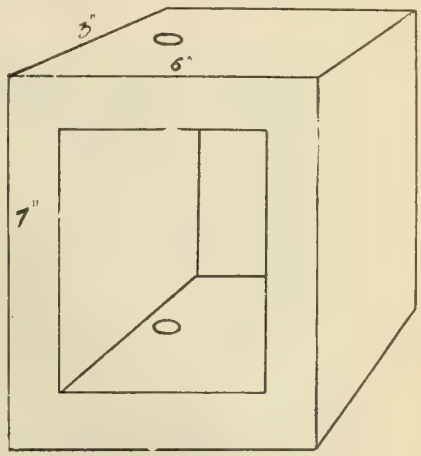
Three blocks are necessary for 6-arm wheel. They will handle gears and



Parallel Blocks 3"x6"x7".

pulleys up to the diameter limit of the boring mill and 12 in. in width.

WESTERN RAILWAY CLUB.

A large number of railway men met at the Royal Alexandria, Winnipeg, recently and adopted by-laws and a constitution for what will be known as the Western Canada Railway Club. It will meet on the second Monday of each month, except June, July and August. The following officers were elected: Wm. Whyte, honorary president; M. H. McLeod, G. J. Bury, G. W. Caye, W. Phillips, honorary vice-presidents; Grant Hall, president; L. B. Merriam, first vice-president; W. H. Roseberry, secretary; T. Humphries, treasurer; E. W. DuVal, secretary of committee; R. J. Hungerford, C. W. Cooper, J. McKenzie, Wm. Smith, R. McNeil and L. O. Moody, executive.

CENTRAL RAILWAY AND ENGINEERING CLUB.

The regular monthly meeting was held in the Rossin House, Toronto, on Tuesday, February 16, when an illustrated paper on "The Railway Department of the Y.M.C.A. as a factor in Modern Railway Operations," was read by J. M. Dudley, secretary of the International Committee of the Y.M.C.A.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The Toronto Section of the A.I.E.E. held their regular monthly meeting on January 22nd, in joint session with the Society of Chemical Industry.

J. C. King, of Willson Carbide Co., St. Catharines, presented a paper entitled "Electro-metallurgical Processes." It traced the development of the Electro-metallurgical industry from very earliest dates. The paper was accompanied by a number of drawings of recent designs in electrical furnaces with a full description of each type and present day practices.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

NEW BATH GRINDER.

A new type of grinder is shown in Fig. 1, the Bath Improved Universal. The frame is of standard construction, but several improved parts have been added. The machine has two power cross feeds, a power feed for cylindrical grinding, and a power feed for surface grinding. The grinder has equipments for plain, surface, internal, disc and cutter grinding of all descriptions.

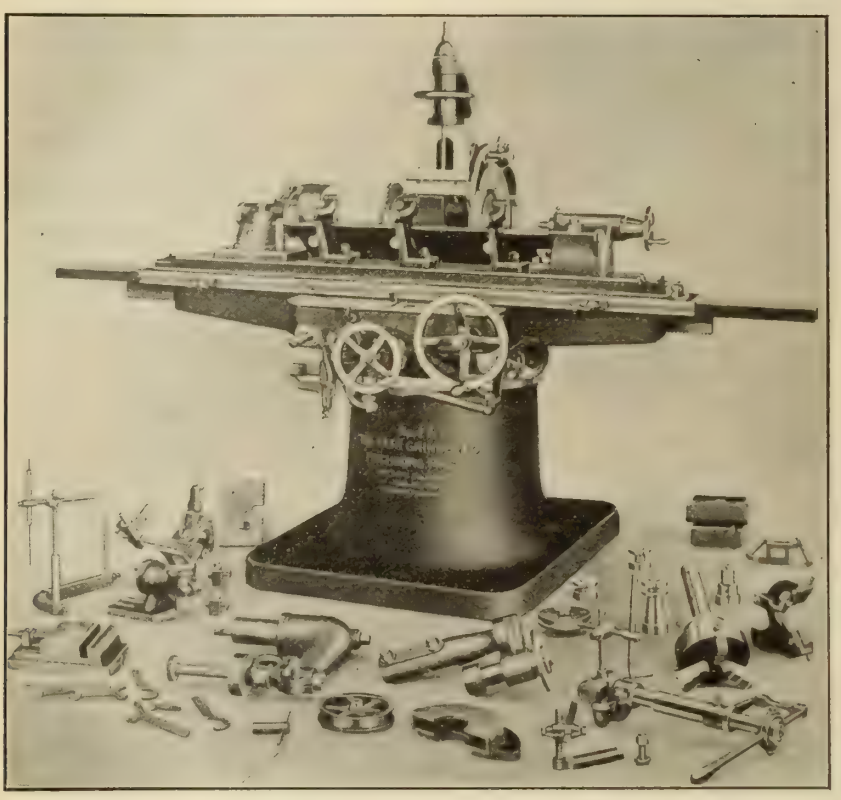


Fig. 1.—New 2½ Universal Bath Grinder with its Attachments.

The apron is seen to advantage in Fig. 2 with the power automatic cross feeds, one for cylindrical grinding, and one for surface grinding, each independent of the other, and both can be disconnected from the cross screw. The feed for cylindrical grinding will feed as fine as .0002, and upwards, and the feed for surface grinding feeds from 1-64 to 3-32, to each stroke of table. The cylindrical grinding feed is equipped with an automatic throw-out, for duplicating work. The reversing mechanism is positive in its stroke, and work may be ground close to the shoulder. The table slide is controlled by a single lever, which reverses the feed in either direction, and starts or stops the traverse movement. By turning the handle at any point of the movement, the table will be stopped at the end of the stroke. The cylindrical grinding feed acts at each end of the table stroke, and the power that operates this mechanism is taken from the mechanism that reverses the table slide from the compressed plunger as shown below the large knurled knob in center of the cut.

Fig. 4 shows the application of parts. In the view at the left the finished bright surface at the end of the spindle head is to take a square or beveled protractor, to accurately place work or any attachment on the machine. Clearance for cutter or reamer grinding and work positions are measured by the combined elevating screw, sliding graduated rod and revolving dial on top of the machine which gives a micrometer reading. The second view shows an extension arbor support for the wheel for surface grinding, form cutter work, snap gauges and similar work where it is more convenient to have the wheel carried away from the spindlehead. The third view illustrates a rigid method of mounting the internal grinding arm in a bore on the side of the machine. The belt is tightened when in motion by turning the hand wheel on the top of the machine. The fourth view shows an easy method of clamping the double ended tooth rest stand to the spindle head with the same screws as are used for the surface arm. The tooth rest comes down from the top and up from the bottom in front, of a disk and cup wheel. In the view on the right the position of the spindle head when used for plain grinding is shown, together with the wheel hood and Wizard water spout.

The view at the left in Fig. 5 demonstrates how a threaded milling cutter

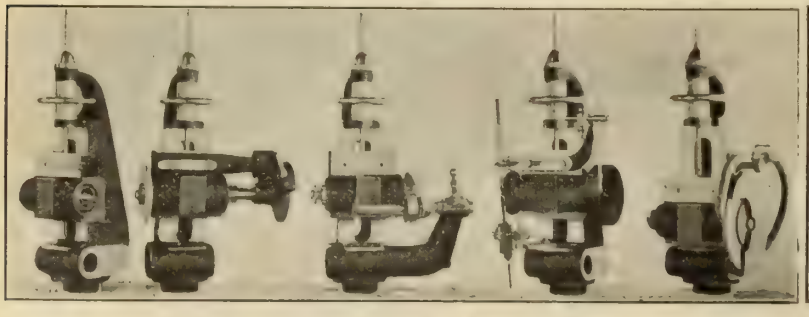

Fig. 4.—Different Uses of Spindle Head.

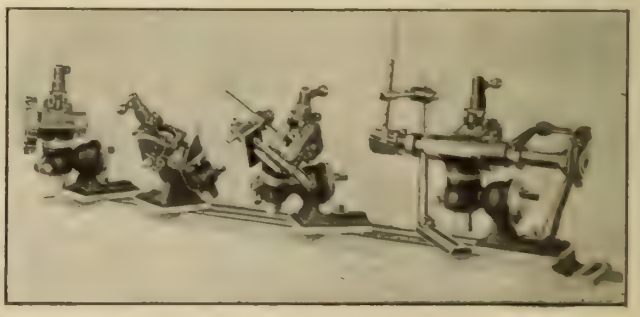

Fig. 5.—Methods of Supporting Work.

may be mounted on an arbor and held in the universal holder for grinding, both

In the middle view the chuck is mounted in the holder, and is holding a

This grinder is manufactured by Bath Grinder Co., Fitchburg, Mass.

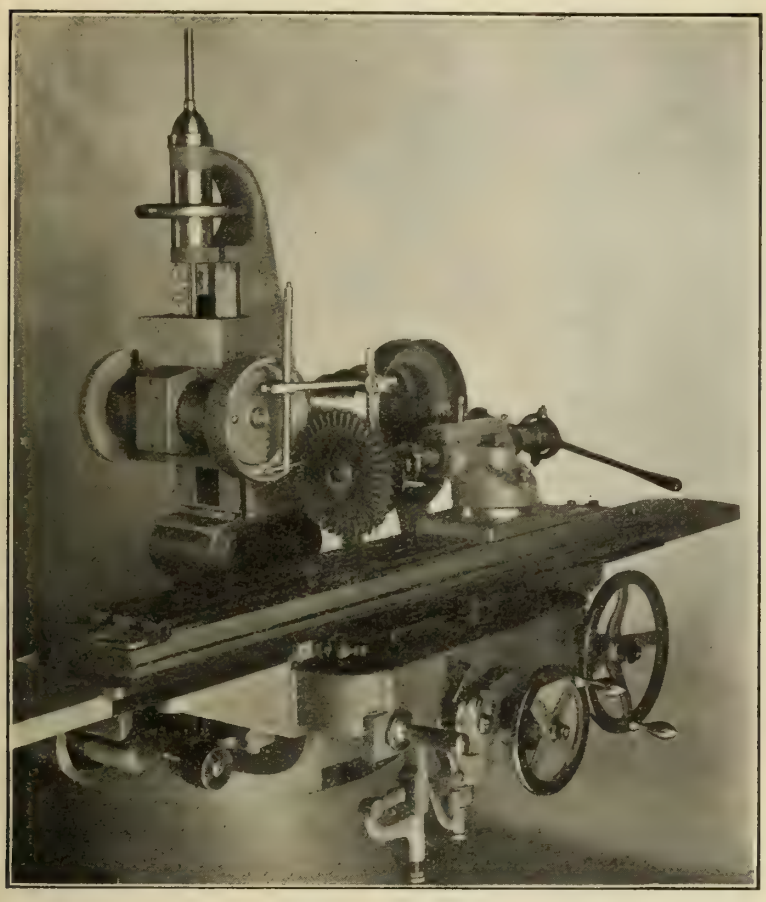

Fig. 2.—Setting for Grinding the Face of a Side Milling Cutter.

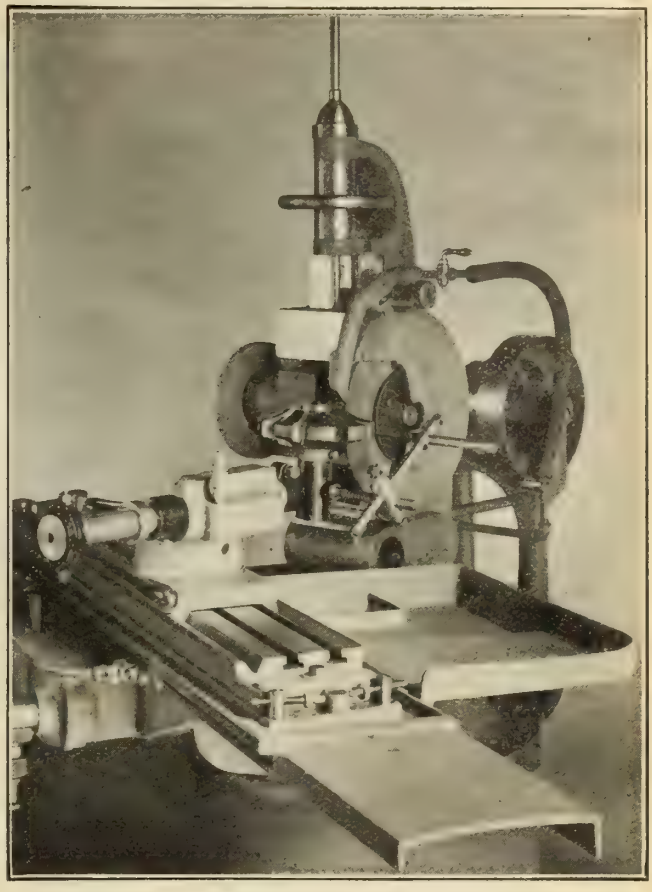

Fig. 3.—Grinding a Large Gear Cutter.

the face of the cutter and the spiral tooth. In the second view a short straight shank is held by one end of the jaw. In the third view a taper shank end mill is held in a V-vise, the jaw being tipped to the angle of the shank. The fourth view shows the method of grinding a spiral cutter with the cutter bar attachment mounted in the universal holder. The tooth rest is tipped to the angle of the spiral.

The left-hand view in Fig. 6 shows the horizontal vise and flange plate mounted in the base of the holder. Either can be adjusted independently of the other.

conical bearing. The right-hand view, Fig. 5, shows a milling cutter mounted on a face plate which is held in the universal holder.

In the left hand view, Fig. 7 the chuck is mounted in the V-vise of the universal holder, and it may be seen how it can be swung to an angle. The second view is a suggestive use of the holder, and the third view illustrates the method of holding small cutters in a chuck for grinding. The right-hand view shows the flange plate mounted in the socket of the vise, which can be set at any desired angle.

TRAVELING HEAD FACE GRINDER

A very satisfactory type of traveling head grinder is here illustrated, known as a face grinder. It is particularly adapted to the work of structural iron workers, bridge builders, safe makers and manufacturers in kindred lines, where it is necessary to grind to very exact figures any materials that are liable to be too hard to be machined, such as beams, columns, steel safe plates, cast iron floor plates, iron stair cases, cast iron fences and railings.

As shown in the illustration, the

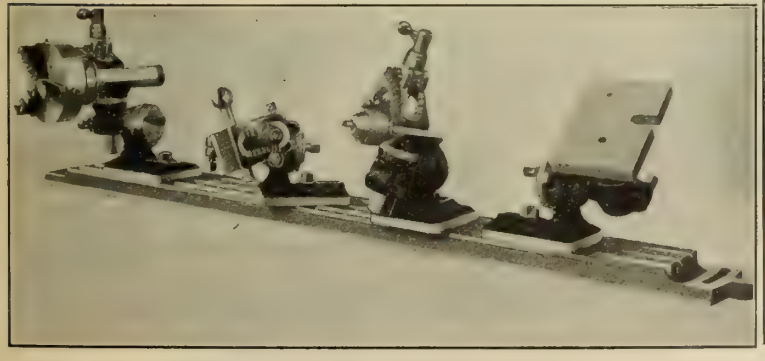

Fig. 6.—Methods of Supporting Work.

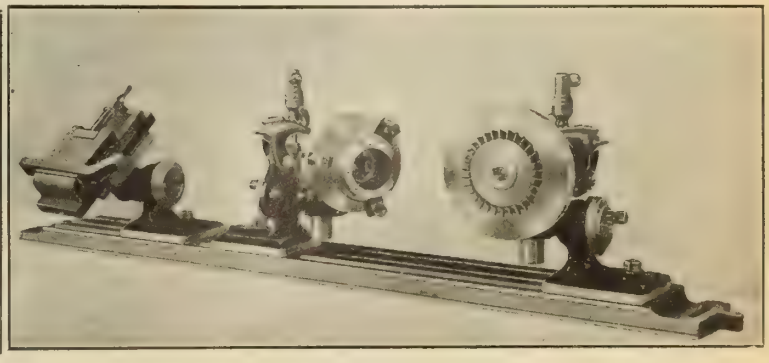

Fig. 7.—Methods of Supporting Work.

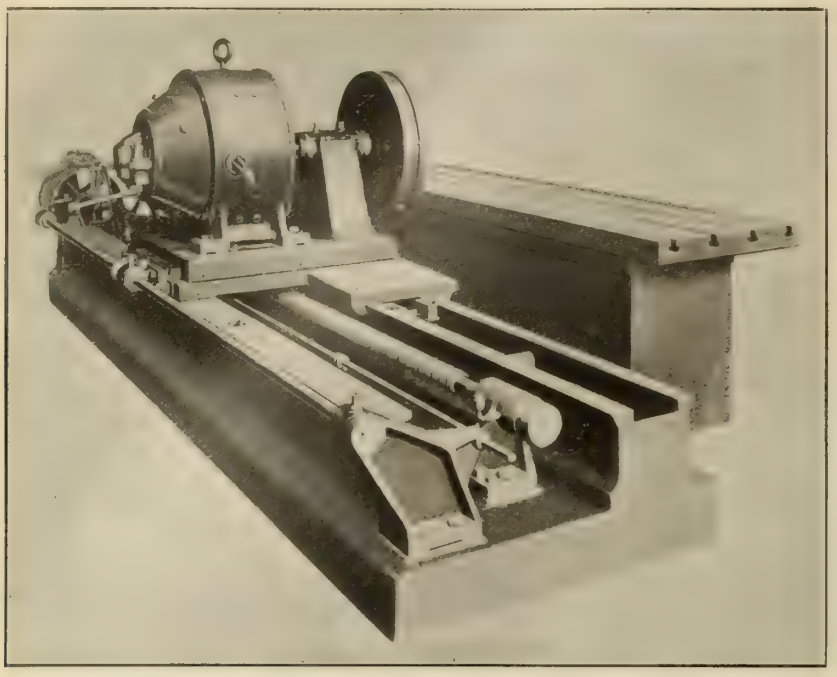
grinding head is direct connected to an electric motor, which, together with a very heavy outboard bearing, is mounted on a large base moving on ways. The motor has an extended shaft to carry the grinder chuck. The work is stationary, being bolted to the large platen in front of the 22-inch emery ring, while the ring rotates and also moves slowly back and forth from end to end of the platen. The reversing is done by a hand lever, when the machine is in use, but automatic stops are provided at each end of the extreme travel, to prevent over-travel should the attendant neglect to reverse the feed. The maximum traverse feed of the grinder is ½-inch, and is operated by a hand wheel and mitre gear on the splined shaft in the front of the machine. The longitudinal travel of the grinder is obtained from the powerful feed screw shown in the illustration. Attention is called to the fact that the travel, 20 feet per minute, is somewhat faster than might be supposed from the thread of the screw as a triple thread is used. The lead screw is driven by a second motor not shown in the illustration.

The grinder is driven by a standard Westinghouse type "S", compound wound, direct current, 10 horse power, 1,100 R.P.M., totally enclosed motor. Where required, an alternating current motor may be supplied in place of the direct current motor. The size of the motor to operate the lead screw is dependent upon the nature of the work to be performed, that is, the amount of metal to be removed.

This grinder is a 102-inch face grinder, as manufactured by the Diamond Machine Company, of Providence, R. I.



Motor-Driven Traveling Head Face Grinder.

JOHN STEPTOE, 16 INCH CRANK SHAPER.

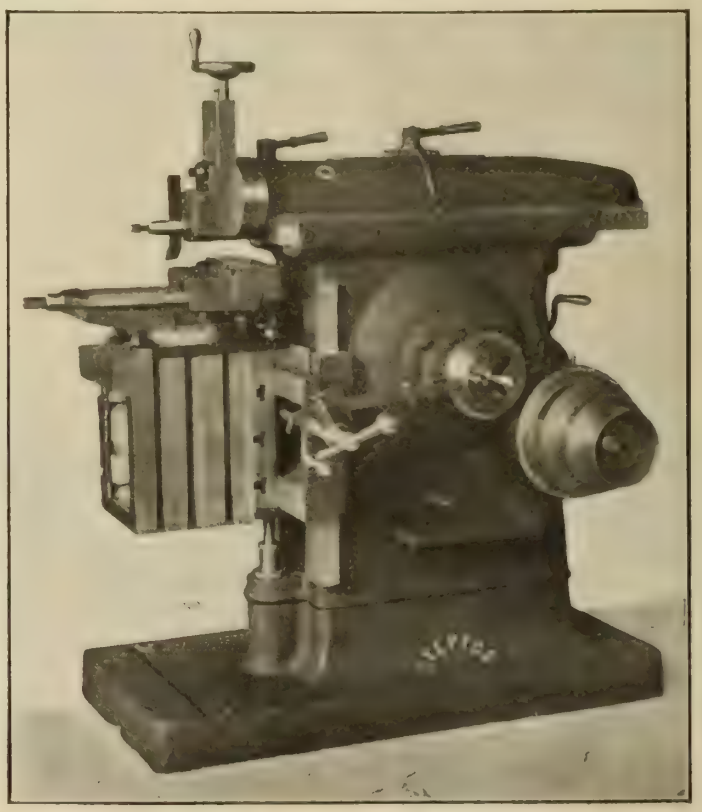
The accompanying cut is that of the new designed John Steptoe Shaper, in which some new features have been incorporated.

The head can be instantly loosened and swiveled to any angle by pushing the lever at the back of the head, and can again be instantly fastened by pulling the lever towards the operator. A stud passes through the center of the harp, and an eccentric stud from the top of the ram pulls the head squarely against the front of the ram.

The length of stroke is secured by means of the lever projecting through the feed plate. This operation can be performed while the machine is in motion. The device in the bull gear is self-locking, and is held firmly in position as soon as the adjusting lever is taken off the shaft, thus avoiding the necessity of locking the shaft in position.

The telescopic screw under the table is fully enclosed, thereby avoiding the possibility of oil and chips getting under the base.

The shaft bearings are provided with cast iron bushings. These bushings are made a tight fit, and are pressed in place. These bushings can be very readily removed, and replaced at any time should it become necessary. The shaft bearings are provided with ring oilers; the ring carrying the oil from an oil well to the shaft, as it revolves. The back geared crank shaper, illustrated above, has a single geared ratio of $6\frac{3}{4}$ :: 1, and a back geared ratio of about 20 :: 1. The back gears consist of a sleeve to which two gears are attached. The sleeve gears are splined to the shaft, and are therefore constantly running with the shaft.



John Steptoe 16" Shaper.

The feed plate is different from the design usually used. The feed eccentric is pivoted, so that it can be swiveled in any direction. The holes in the plate are drilled and reamed tapered. The stud in the eccentric has a spring in it, and is also tapered. The tapered pin will thereby take up any wear which may occur in this hole. The holes are drilled in a circle, in order to keep them as far apart as possible. They are drilled and numbered in accordance with the teeth in the feed ratchet, thereby making it very easy to secure any desired feed. The ring which encircles the feed eccentric is split, and fitted with a fibre washer, thereby permitting any wear, which may occur in the ring to be very easily taken up by filing this washer.

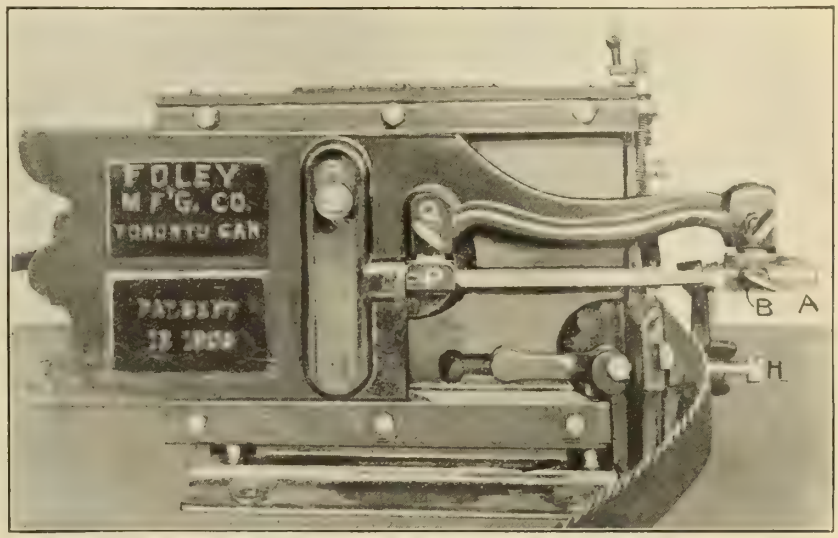
This shaper is manufactured by the John Steptoe Shaper Co., Cincinnati.

FOLEY AUTOMATIC FILER.

The saw illustrated in the two half-tones is a combination automatic filing setting and jointing machine. It can be arranged for a 6" or 7" file by changing the roller in the cam. The three sides of file may be used by turning the bushing.

The vise relieves itself by means of a double cam every time the saw feeds. A regulating device keeps the saw jointed. A special attachment for setting is used when the saw requires setting. It can be thrown out of gear when not in use. A saw may be filed or set independently. The saw set is geared to turning the file, the saw may be given an under cut. The frame is raised at an angle allowing the file to be brought out from an undercut.

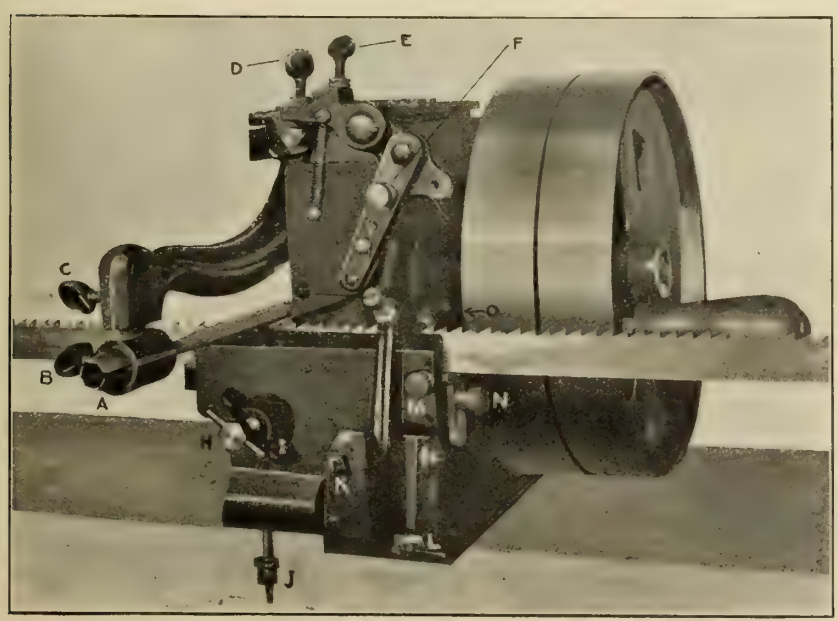
The working is entirely automatic.



Side View Foley Automatic Filer.

Bushings may be replaced to suit any file, slim, extra slim taper file or regular band saw file. The slides or wearing parts of the machine are made of steel and are adjustable to take up the wear.

The parts of the saw are marked so that the reader may understand the construction of the saw and use of parts. A.—Bushing for file, adjustable to any angle; B.—set screw to hold to lock vise when file is on forward stroke; J.—Raise or lower saw in vise; K.—Set screw to adjust setter to teeth of saw; L.—Screw to raise or lower set; M. Screw to hold vise steady when setting; N.—Guide to hold saw even when setting; O.—Pin in eccentric to throw set in and out of gear; P.—Bush for tang of file; and R.—Roller in cam to adjust stroke.



Front View of Foley Automatic Filer.

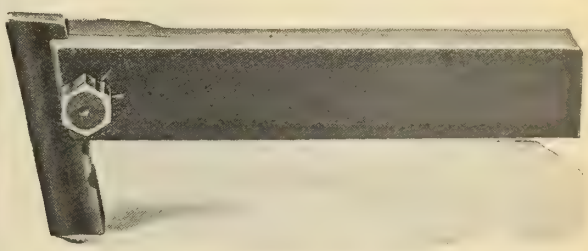
power wheel and works on a cam motion. The feed can be arranged to feed saw with uneven teeth and set or file them even.

Belt or hand power may be used. By bushing; C. and Q.—raise or lower file; D.—Adjust tooth to file; E.—Adjust dob to take only one tooth; F.—Setting dog for uneven teeth; G.—Adjust set of saw; H.—Lock screw; I.—Nut

LANG'S TOOL HOLDER.

This is a 2-in. by 3-in. x 16-in. inserted Tool Holder designed especially to turn Locomotive Tires. This Tool Holder is for removing metal on plain work in the Lathe, Vertical Mill or Planer. It will take a cut on a pair of 72-in. worn Locomotive Drivers of $\frac{1}{4}$-in. feed by $\frac{5}{8}$-in. depth cut at a speed of from 10 to 15 feet per minute.

The regular cutters furnished are drop-forged, of best 70c high speed steel. The



Lang's Tool Holder.

points are air-hardened and ground ready for use. The cutters are 7 inches long and 2 inches across flat and are set in the Holder at 10 degrees front and side clearance. This allows grinding on face as well as top, as 7 degrees is the proper clearance, the face of cutter need only be ground a short distance down from top.

The Holder is made of steel of over 100,000 pounds tensile strength and oil

hardened and is made right and left hand (right hand feeds towards headstock of Lathe.)

This holder is manufactured by G. R. Lang Co., Meadville, Pa.

"USE-'EM-UP" SOCKETS.

The socket illustrated herewith was invented to overcome the loss due to the tangs being twisted from high speed drills.

It will be noted that this socket is similar to the standard taper socket with two exceptions; one, that it has a flat on its inside surface, and the other that the drift slot is somewhat longer than on the ordinary socket, to facilitate the driving out of tangless drills.

With the socket described it is only necessary to grind a flat on the remaining portion of the shank after same has been broken off, or the tang twisted off, in order to put the drill into immediate use, or if a flat is ground on a new drill the trouble of having a tang breaking will be eliminated.

Flattening the drill shank to fit this socket does not in any way interfere with its use in the standard taper socket. This drill is manufactured and

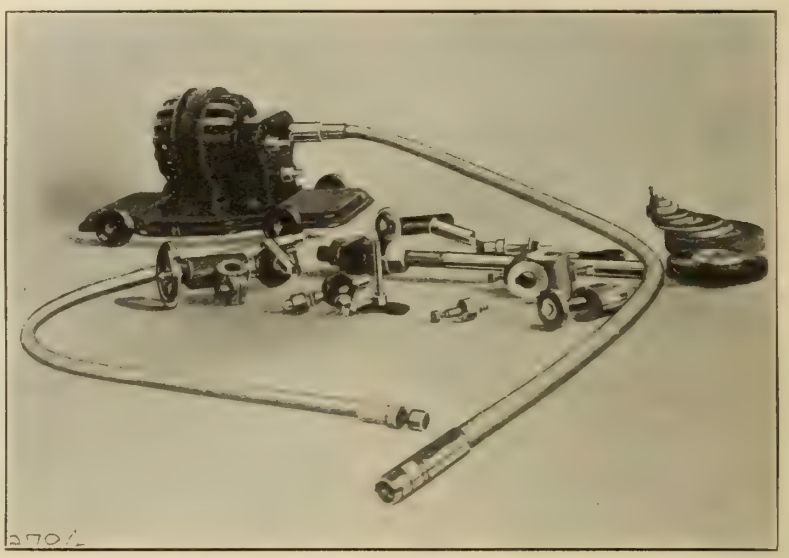
Use-Em-Up Sockets.

sold by the American Specialty Company of Chicago, and we understand the price is very reasonable.

SMALL MOTOR-DRIVEN EMERY WHEELS, BUFFERS AND DRILLS.

The illustration shows a handy motor-driven flexible shaft outfit. The equipment consists of a breast drill, drill press, emery wheels and polishers, and is provided with such necessary attachments as a multiplier, clamp, spindle, old-man, etc. The motor is a 1 h.p. Westinghouse type CCL alternating current motor, mounted on a portable truck, and fitted with speed changing head and flexible shaft. The portability makes the appliance convenient for any large work, and the flexible shaft permits the operator to work with ease upon otherwise difficult accessible parts.

In order to obtain the proper cutting speeds for emery wheels of different diameters, multipliers of the proper ratios are used. The two which can be used to best advantage are those having ratios of 8½ to 1 and 6½ to 1 respectively; the former for use with ⅛ in., ½in. and 1 in. wheels, and the latter for 2 in. and 3 in. wheels. Larger sizes



Small Motor-driven Emery Wheels, Buffers and Drills.

are used on a clamp spindle which runs at the speed of the shaft, 1,800 to 2,500 r.p.m.

By removing the breast plate on the drill and attaching a combination old-man, drilling up to ½ in. can be readily done. Larger drills up to 1¼ in. are used in connection with a worm feed drill press and old-man attachment.

The outfit is so arranged that a heavy or light shaft can be used according to the requirements of the work. The smaller shaft is fitted with a taper and sleeve for taking small tools, and the larger shaft with clutch sleeve and grab dog clutches, so that one tool can be used after another without making any change in the shaft. The outfit was made by the Coates Clipper Mfg. Co., Worcester, Mass.

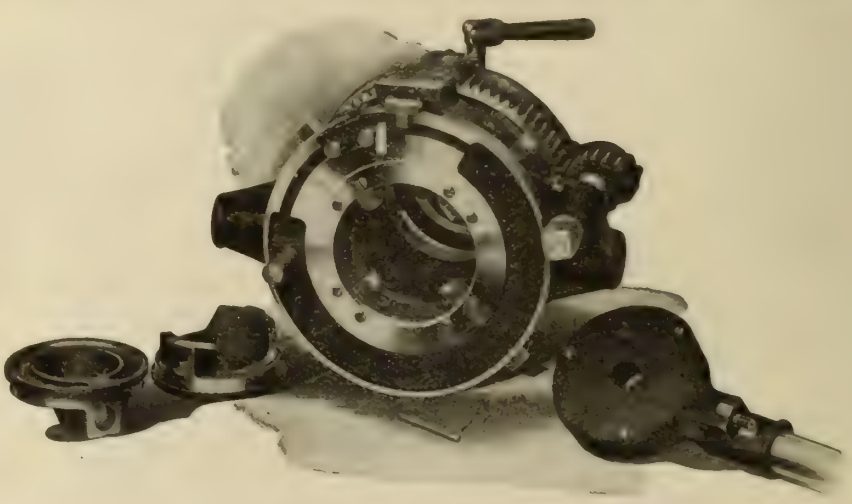
NATIONAL DIE SHARPENER.

This machine is intended for sharpening Bolt Cutter dies, giving them the proper entrance and correct clearance.

It is simple in design. A 6" wheel is used, which can be redressed to 3½" without affecting the machine's operation. A suitable chart is furnished for making the necessary settings for various diameters, and may be changed from one size to another.

It will sharpen any size or type of threading die.

This new Die Sharpening Machine was recently brought out by the National Machinery Company, Tiffin, Ohio, manufacturers of bolt and nut machinery.



The National Die Sharpener.

The man who trusts to his cunning for success is next door to a thief.

One cannot travel very far within, without progressing outward.

Although genius may occasionally exhibit eccentricity—eccentricity does not imply genius.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

DALLETT AIR COMPRESSORS.

These compressors incorporate the essential features of having all parts requiring adjustment or renewals readily accessible, and using a liberal amount of metal, to insure rigidity in operation.

The frame is of the Open Fork center crank type, and designed to obtain on each size compressor a greater range of capacity by substituting, when desired, a cylinder of the next larger size than the standard to operate at 100 lbs. pressure. For example :— On an 8" stroke compressor, the regular cylinder for 100 lbs. pressure is 8" in diameter, but a 10" diameter cylinder can be substituted and still operate at the above pressure, whereby a greater volume of air is obtained with but a slight increase in cost of machine.

The cross head guides are cylindrical and are bored at the same setting as the boring and facing of the end which receives the cylinder, insuring absolute alignment. Lubrication is effected by means of sight feed devices, or by gravity or force feed system, as desired, and drains are provided for draining off all drippings from guides, stuffing boxes and crank pit.

The duplex belt, duplex steam and single steam machines are supported on a rigid and deep sub-base, thus making the entire machine self-contained and insuring satisfactory operation on either a rough temporary foundation of timbers, or a permanent one of concrete or brick. An oil gutter is provided entirely around the lower base flange on all sub-bases.

The steam cylinder and valve gear of the steam driven machines are examples of up-to-date steam engine practice, giving high efficiency. All steam ports are short and direct and of the proper area. The clearance has been reduced to a minimum, giving an appreciable saving in steam consumption. A plain D balanced slide valve is used on the small and medium sized machines ; the Meyer balanced adjustable cut-off valve being employed on the larger machines. To provide efficient heat insulation, all steam cylinders are lagged with mineral wool and neatly jacketed with planished sheet steel.

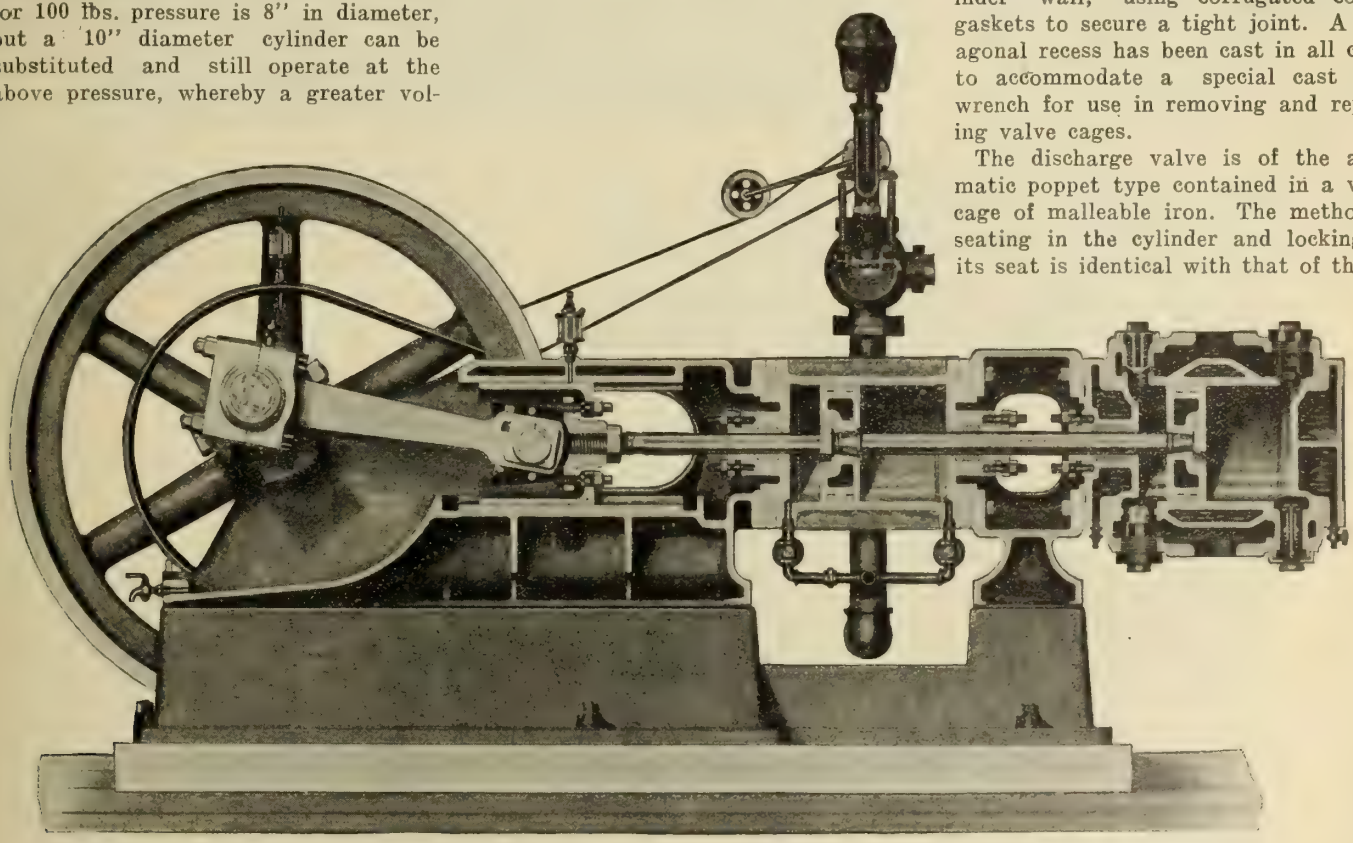
The rocker arms on all valve gears are provided with means for adjustment. On every steam driven machine the governor is equipped with a safety stop device, which immediately stops the machine in case the governor belt should break.

Mechanically operated inlet valves are supplied on any size compressure desired. These valves are ground to gauge and the valve holes lapped to size.

The intake valve is of the automatic poppet type, contained in a malleable iron cage. The cage is one piece and combines both seat for the valve and guide for the valve stem. The cage is threaded and screws into the wall of the air intake chamber only, and is simply seated in a recess on the main cylinder wall, using corrugated copper gaskets to secure a tight joint. A hexagonal recess has been cast in all cages to accommodate a special cast steel wrench for use in removing and replacing valve cages.

The discharge valve is of the automatic poppet type contained in a valve cage of malleable iron. The method of seating in the cylinder and locking to its seat is identical with that of the intake valve. A projection or boss has been provided on the valve cap, which acts as a positive stop for the valve when it has reached a lift, giving a full opening area, and does away with fluttering. This same projection on the cap also acts as a spring guide for the valve spring.

The compressors described are built by the T. H. Dallett Co., Philadelphia, in sizes from 8" stroke up to and including 16" stroke, and give a range of capacity from 79 cu. ft. of free air per minute to 1200 cu. ft.



Sectional Elevation of Single Steam Machine.

The Application of Chain Drives to Machine Tools

Second Article Showing its Use in Driving Other Machinery, Such as Blowers, Hammers, Counter Shafts, Line Shafts, Etc. — A Consideration of Chain Drive Efficiency.

Last month we took up the origin and growth of driving chains, showing the different types, including the silent chain. The article also contained a short description of the shops of Hans Renold Ltd., who were the originators of the chain.

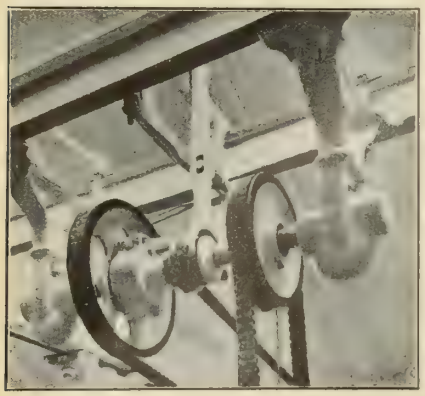


Fig. 1.—Coil Clutch Arrangement.

Like all new methods and appliances, chain driving has had its opposition from those who are over cautious and conservative about throwing out older, but still satisfactory, methods of drive to take on the new. First cost of chain drives, too, has been an important factor in the opposition, but this has been reduced by the inovation of modern machinery for their manufacture. In some instances, where it has been impossible to use belt or gear drives, the use of the chain has been made imperative.

In the new work of Hans Renold Ltd., chain driving is almost exclusively used, in fact, to such an extent as to raise the question as to whether the extensive use is due to over enthusiasm or to economical reasons. The use of chain makes an economical system of drive

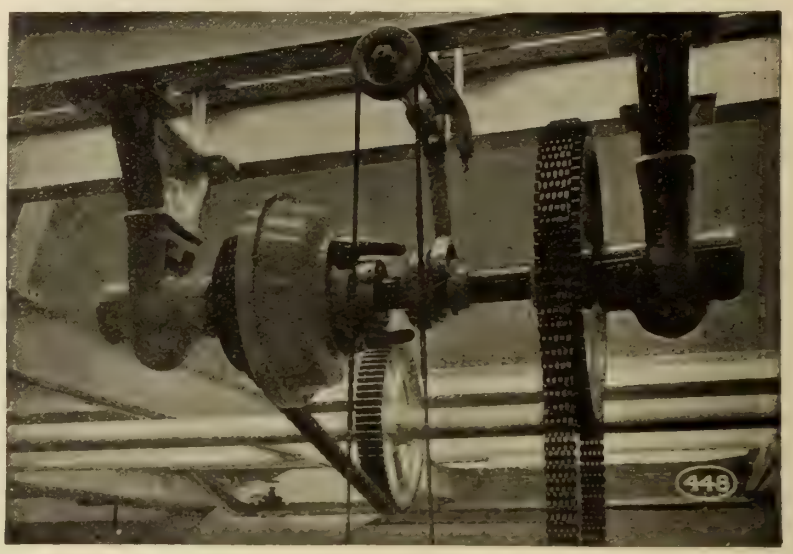

Fig. 2.—Countershaft with Cone Clutch.

Fig. 3.—View of Line and Countershafting.

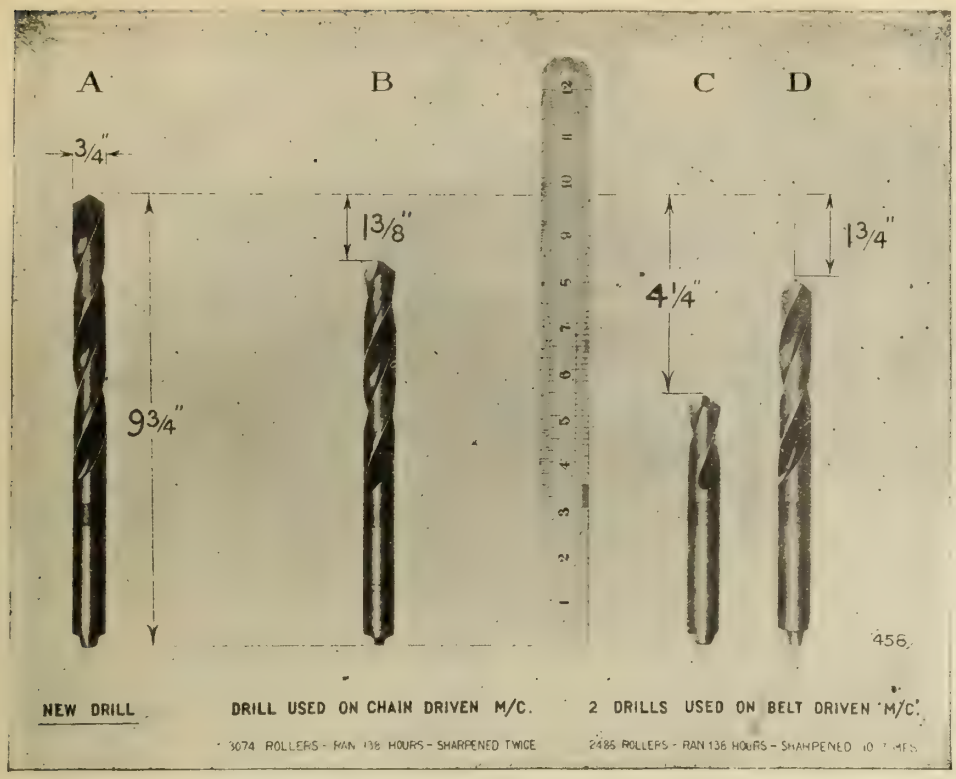

Fig. 4.—Drills Used in Automatic Mac hines.

and the results of several experiments made on a few of them are included in this article.

Countershaft Drives.

Typical countershaft drives are shown in Figs. 1 and 2. The shafting can be very easily rearranged as the hangers are clamped to the beams and not balked through. This arrangement is evident in Fig 1, which shows the clutch used on machines taking not more than 3 or 4 horse power. The

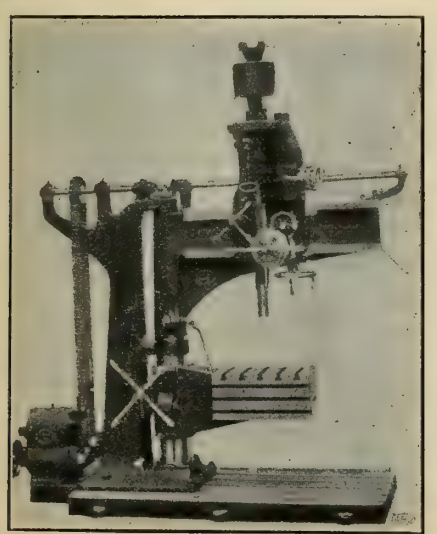

Fig. 6.—Chain-Driven Radial Drill.

clutch is of the coil type and is actuated by a lever moved by an eccentric pin, which works in a slot through the lever. Rods or chains, hanging down within reach of the machine operator, rotate a pulley fixed to the shaft which carries the eccentric pin. The engaging gear is better shown in Fig. 2. This shows a cone clutch, which type is used on drives above 4 horse power. The clutch is completely enclosed and is provided with well oiled, self contained thrust bearings. Fig. 3 shows the shafting over one of the automatic bays in the Renold shops. Some of these very light machines are driven by belts but the spindles of the larger ones are driven by chains. It will be noted that the machines, shown in Fig. 3, are set at an angle to allow the stock in one to clear the bed of the next. This angle seems not to interfere in the least with the running of the chains.

In considering the change from belts to chains records of the operations, increase or decrease in output, etc., were carefully kept and the results will be interesting. In this particular arrangement of "automatics" a saving of over 20 per cent. in the power bill was made, and the output increased from 15 to 25 per cent. Regarding the quality of the work turned out, it was found that it was better. The tools had a longer life which, of course, had a direct effect on the output. It was also possible to

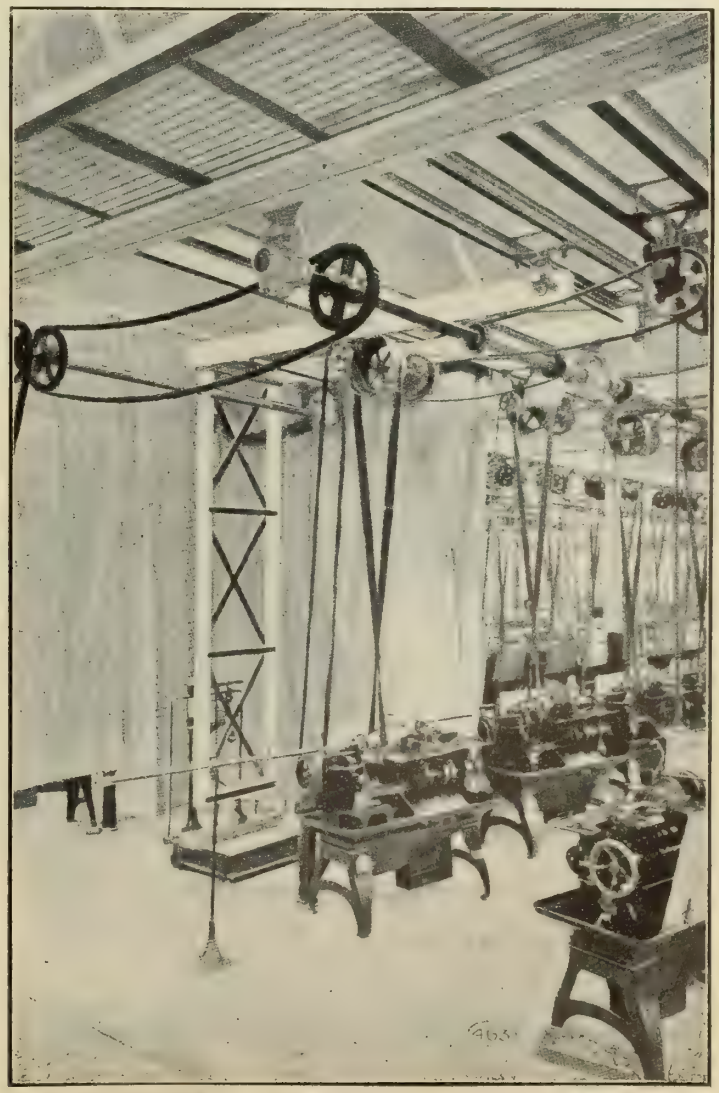

Fig. 5.—Methods of Testing Tension in Belts and Chains.

accommodate a greater number of machines and the shop is quite as silent as a belt driven shop. Overhead light and space are saved, on account of the chain sprockets being from 50 to 80 per cent.

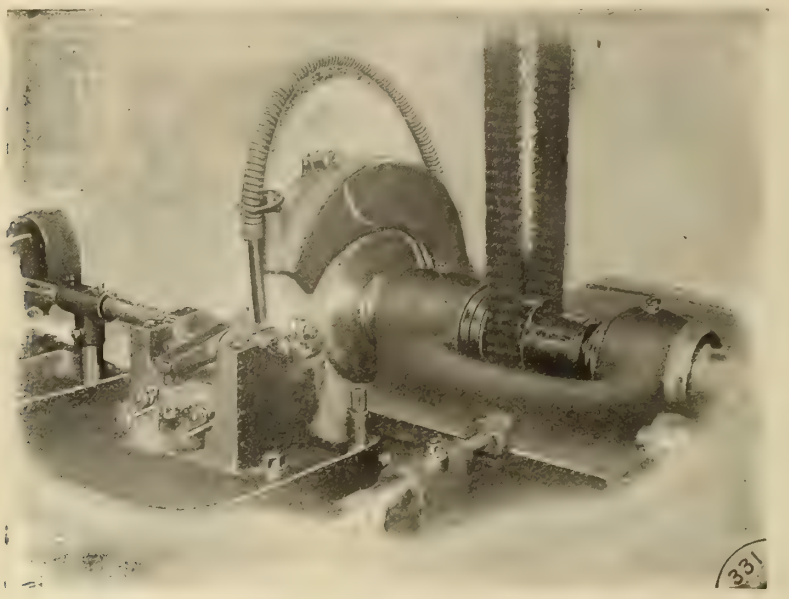

Fig. 7.—Chain-Driven Grinding Machine.

less in width and from 30 to 50 per cent. less in diameter than belt pulleys.

In first cost the belt arrangement had the advantage of being about $1,000 cheaper than the chain instalation. Assuming that there is no difference in the depreciation and maintenance charges for chains as against belts, the total annual cost of running the department amounts to about $30,000 per year. Now it has been found that chain driven automatics effect a saving of at least 75 per cent. in the cost of tools and that chains have about three times the life of belts. It was also found that a group of chain driven automatics had a larger output with two operators than the same group had previously with four. The interest on the difference in first cost is negligible compared to the total shop charges, the increased production and other benefits obtained giving a good balance on the right side.

Fig. 1 is a photograph of drills used in the trials of the automatic lathes and is self explanatory. In a trial of the automatic lathes, lasting 138 hours the records were as follows: On the belt driven machine the circumferential speed of $\frac{3}{4}$ in. drill was 93.75 ft. per min., the feed per revolution, .0028 in., and the drill was ground 10 times; the speed of the chain driven drill was slower, being 56.25 ft. per min., the feed greater, being .0046 in. per rev. and the drill was ground only twice.

In investigating the effect of the use of both chains and belts on the bearings of the machines Fig. 5 shows how the tension was measured. The weight of 23 feet of chain used was 32 lbs. and that of the same length of $2\frac{3}{4}$ in. leather belt, 5 lbs. The small screw jack seen on the scales platform was used to give the desired tension by raising the frame holding the counter shaft. The pressure due to the chain did not exceed 68 lbs. on the counter shaft nor 36 lbs. on the machine spindle.

Machine Tools.

In Fig. 6 is shown the spindle drive of a radial drill. A considerable amount of power must be transmitted in cases like this especially at the low speeds. A belt drive would, in this instance, have to work at such a tension as to be hard on the bearings, whereas the chain would put no pressure on the lower bearing and only the pressure due to the weight of the chain on the top box. On grinding machines, one would hardly suppose chain driving would be suitable, yet the emery wheel shown in

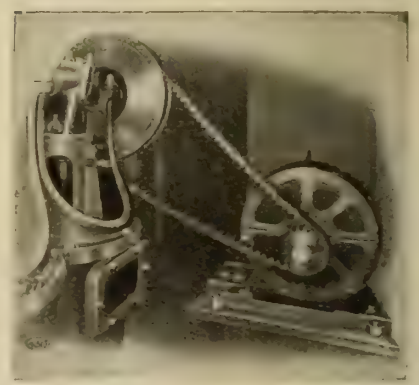

Fig. 9.—Springwheel Drive on Pump.

Fig. 7 has been driven for several years and has given the best of results. The feed works of this machine are driven by roller chains.

In the minds of some people, the idea exists that the positive drive of the chains is liable to cause accidents to machines by not giving or slipping, as a belt would when a sudden load is applied. The possibility of such occurrences is eliminated in different ways. On motor drives an automatic cutout is connected with the feeders that cuts out the current when a definite load is exceeded. Another method is to use a sprocket, the rim of which turns freely on its hub. The tongue is transmitted through a pin graded to suit the power required and which is sheared off by the application of excess power.

Fig. 8 shows a motor driven lathe for heavy work. If the motor and head shack are made sufficiently strong the lathe will remove as much metal as the tool can be made to stand.

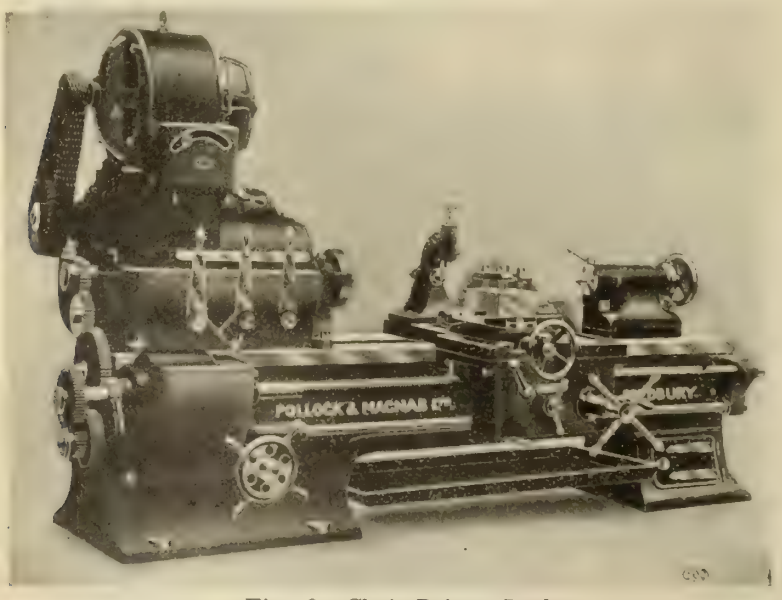

Fig. 8.—Chain-Driven Lathe.

Other Drives.

In pulsating loads such as occur in pumps (see Fig. 9) a spring sprocket is used. The construction of such a drive is clearly shown on page 54 of the February issue of Canadian Machinery. The springs, acting under compression between the boss and the rim, absorb irregularities in the load and save the chain from the tendency to shake to pieces. The armature of the motor is also profited by this cushioning.

The two large fans shown in Fig. 10 are used for heating and ventilating the works of Hans Renold Ltd. The motors run at 720 r.p.m. and the fans absorb about 20 horsepower each. It will be noted that the centres are short which economizes considerable floor space. The chains run very slack which is beneficial to the bearings and reduces the wear and tear on the machines to a minimum.

Fig. 11 gives one a good idea of the size of some of the larger silent chain drives. In this illustration the sprockets are of the spring cushion type. These chains are used in a coal mine, to transmit 200 H.P. from electric motors to hauling drums.

Two chains run side by side on a set of wheels (200 H.P. per set), the lineal speed of the chains being 1,170 ft. per min., the pinions make 286 and the spring wheels, 74 revs. per min.

There are many more individual cases of chain driving that might be mentioned would space permit, but the above will serve to show the strides that have been taken in the development of this type of drive. Of course it has its limitations and there are many cases where it would be impracticable to employ it. For such cases, the older ways of driving by belt, rope or gears will probably always hold.

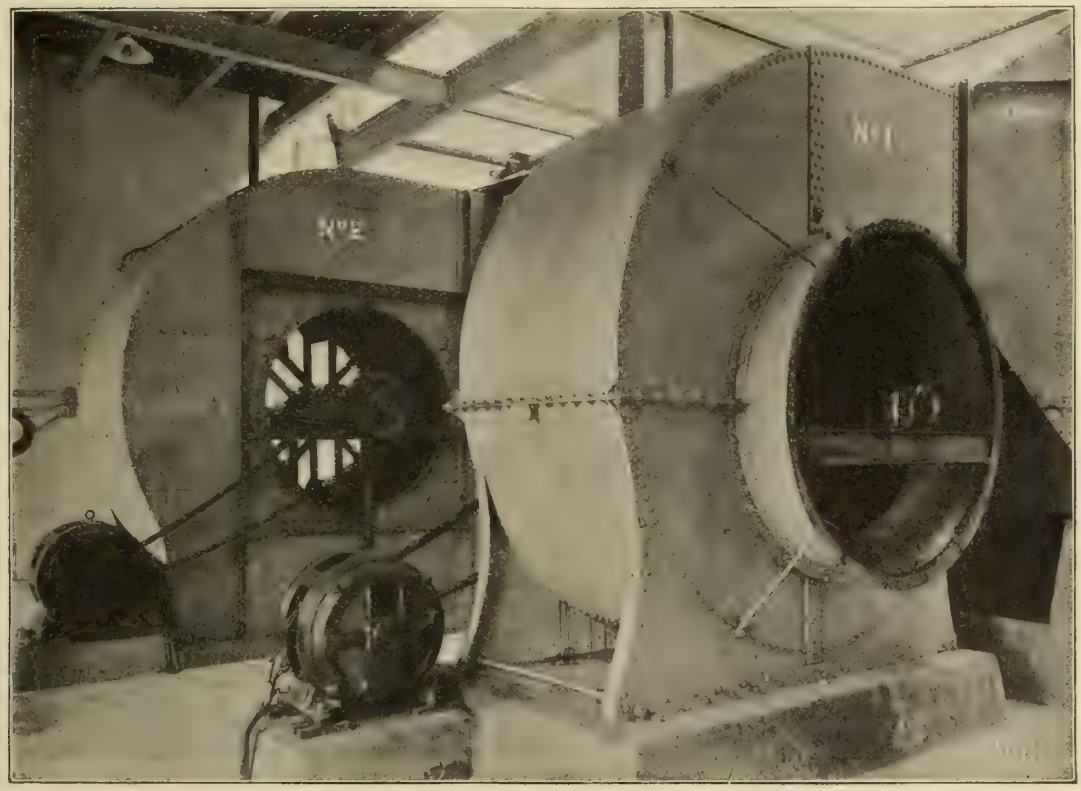

Fig. 10.—Chain-Driven Fans.

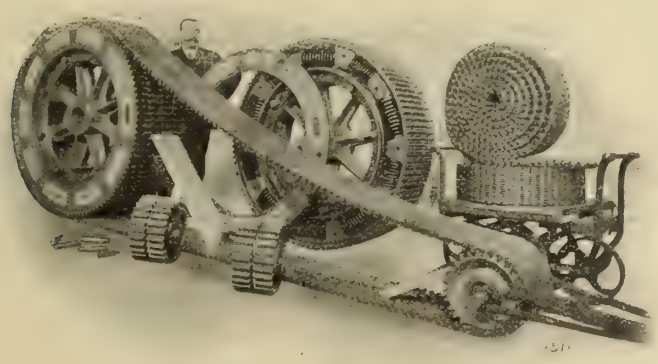

Fig. 11.—Drives of 528 h.p. for Coal-Handling Plant.

Several large instalations of chain drive have been made in Canada and in our next issue we shall give a description of some of these as being of interest to those contemplating the use of this form of transmission.

TORONTO ENGINEERING CLUB.

Mr. J. E. Parsons, B.A., gave an interesting address at the Toronto Engineers' Club last evening upon law as applied to contracting and engineering work. His address was based upon the various legal responsibilities of parties entering into a contract.

Thomas Reid, identified as sales manager of the John Bertram & Sons Co., for many years past, has moved his headquarters to Montreal where he will be associated with The Canadian Fairbanks Co., the general sales agents of the Bertram Co. On account of the importance of the Montreal machine tool market, this move is evidently an advantageous one to both the Bertram Co. and The Canadian Fairbanks Co.

One reason for incompetence is the practice of working at one thing while thinking about another.

CANADIAN RAILWAY CLUB.

The regular monthly meeting of the club took place in the Windsor hotel, Montreal, Tuesday evening, February 2nd. After the routine business was disposed of a paper on "Locomotive Springs" was read by J. A. Kinkead, of Parkesburg Iron Co.

The paper opened with a short history of the earlier researches into the strength and action of semi-eliptic and elliptic springs.

Emphasis was laid on the fact that spring makers and users sacrifice flexibility for strength. "Springs are used in construction on account of their flexibility and within limits their value varies directly as this property. Great care is taken to see that springs are the right width, length, height or strength, while little or no attention is paid to their prime function, flexibility. It sounds unreasonable to say that many spring failures are due to excess strength but such is the case. In all cases of spring failure the flexibility should be carefully checked up, and where the calculated load divided by deflection exceeds 15,000 lbs. substitutes longer springs or thinner plates. One instance which bears out the above assumption was where four leaves were added to a spring, one at a time, as it was thought that failure was due to weakness. With each additional leaf the failure increased.

Accompanying is the "Spring card" of the American Locomotive Company.

"Spring tables for semi-elliptic springs give the capacity of one plate one inch wide and different thickness.

To obtain the required number of plates, multiply the figure given in 'Load' column by the width of spring in inches and divide the required capacity by the result. The quotient gives the number of plates required.

Note.—Where quotient gives decimal more than 3 add one plate to the whole number.

The number of full length plates must be 25 per cent. of the whole number required; other plates must be regularly shortened.

The deflection given in table is the difference between free and loaded height irrespective of width or number of plates; for full elliptics number of plates and deflection given is for each half of spring."

C. S. OF C. E., MONTREAL.

A meeting of the electrical section was held on Friday evening, February 11th. J. A. Johnson, of the Ontario Power Co., Niagara Falls, gave an interesting description and demonstration of the Oscillograph. This is one of the latest instruments to be devised to measure or demonstrate the alternations in alternating currents.

The principle used is the passing of the current in opposite directions through two parallel wires. Across these wires is fastened a tiny mirror upon which a ray of light is focussed. The current causes this mirror to turn backward and forward through a certain arc and the movement of the reflected point of light is photographed on a film fastened to a revolving drum. For ocular demonstration the movement of the light is shown on a ground glass plate.

The lecture was made more interesting by the lantern slides which showed, besides the construction of the instrument, a number of photographs of different alternating current phenomena occasioned by short-circuiting, circuit breaking, etc., etc.

The lecture took place in one of the lecture theatres of the Macdonald Engineering Building, McGill University, on account of the ease with which the various electrical connections could be made.

A. F. A. ANNUAL CONVENTION.

A meeting of foundrymen, supply men and others was held at the Sinton Hotel, Cincinnati, Wednesday, January 27, to arrange the preliminaries for the convention of the American Foundrymen's Association and allied bodies in the week of May 17. James A. Green, of Matthew Addy & Co., was made chairman; William Gilbert, Buckeye Foundry Company, treasurer, and W. L. Finch, secretary. The following committees were appointed: On Hall—John Hill, John J. Bruce, Justus Thorner, F. W. Weissman and H. Black, also an officer of the Foundry Specialty Company. On Entertainment—J. K. Pollock, James A. Green, Harry Frohman, Frank M. Eaton and John Sargeant. On Finance—George McG. Morris, Theo. Bollman, Walter Geler, Lew Walter and Fred Brunner.

Dr. Moldenke, the secretary, can be reached at Watchung, N. J. W. M. Corse is secretary of the American Brass Founders' Association. His address is 123 Palmer Ave. E., Detroit.

C. E. Hoyt, secretary of the Foundry and Manufactururers' Supply Association and of the American Foundry Foreman's Association is confident that this convention will be the best yet held.

The Cincinnati Convention promises to be a big event.

It will pay Canadian foundrymen to attend the convention and see the large exhibits of up-to-date foundry equipment. Papers along various lines of advancement will be read and the exchange of ideas will bring out many ideas for improvements in foundry practice which progressive Canadians cannot afford to miss. Let as many as possible join the crowd at Cincinnati in May.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. V. MARCH, 1909 No. 3

"GOOD ENOUGH" NOT "GOOD ENOUGH."

A mechanic was working on a pattern for a binder and on the completion of his task was heard to remark, "It is good enough." That should not be the question. Are you satisfied with your work? Can you improve it? The self-satisfied man who considers his work good enough will never reach the top of his trade. No good pattern maker ever reached a position of trust by doing his work in a slip-shod fashion. A workman's proudest boast is pay honestly earned for work well done. Everything must be best possible. Poor work is dear at any price.

A good foundation for a reputation in the shop or office is the motto we have given. It has been the basis of success of many strong concerns. It is equally applicable to individuals for on individuals depend the reputation of his company. If a man is content to turn a spindle for a grinder within one-sixteenth of an inch of "snug fit," and say it is good enough he need not be surprised if his company earns the reputation of placing poor and "chattering" tools on the market. Such a mechanic is building for himself and his company an unenviable reputation.

"Good Enough" not "Good Enough" is an industrial battlecry that might well be adopted by workmen and manufacturers. If accurate and careful workmanship is not insisted upon the company must give place to others where thoroughness is the keyword. In the latter establishments mechanics must line up to the motto, "Good Enough" not "Good Enough," or they will find themselves passed over by those who do their best,—who take pains to do things accurately and thoroughly.

SPRINKLER SYSTEMS.

The Heavy cost of installing automatic sprinklers for fire fighting has to a large extent militated against their instalation up to date. This cost is attributable to the expense of submitting provisional plans and providing for inspection and also to the exacting demands which are made by the companies as to the character and extent of the equipment. Sprinkler contractors have in the past had to send a representative to inspect, measure and lay out equipment, and the aggregate cost of three or four contractors doing this service must be added to the general cost of the business.

The insurance department of the Canadian Manufacturers' Association has established a department to act in the capacity of an architect to concerns desiring to install sprinkler systems, their draughtsman preparing one set of plans and uniform specifications on which the sprinkler contractors will be asked to submit tenders. Besides preparing plans and specifications, the department will superintend the erection of sprinkler systems under the regulations of any existing insurance organization. A saving, it is said, can be effected in this manner of from $200 to $500 for each installation, and this should result in a substantial increase in the number of instalations.

Another fact of importance is that modified systems of sprinkler protection involving much less cost and carrying reductions in rates are receiving the attention of the department. There are many manufacturers who are not prepared to install these systems up to the exacting demands of the companies, but would readily provide a more modest outlay in consideration of receiving commensurate benefit.

TAKING CARE OF INJURED WORKMEN.

We often hear of soulless corporations who take no thought of the workmen who are the producers that make profits possible. The workmen toil at the anvil, forging the red hot iron into various shapes; they work at the lathe, or other machine, producing work quickly and accurately; they stoop daily at the task of molding, preparing the sand to receive the large ladles of molten metal, or carry on some other responsible task.

It is the work produced by these men who build up the reputation of a company, and it is a pleasure to note that one large corporation, at least, contains a human element that is touched with the moral responsibility it owes to faithful employes. Whether or not this corporation referred to was legally responsible for an accident that occurred in its works a short time ago the men at its head are to be commended for the liberality and promptness displayed in taking care of an injured employe.

We refer to the Hamilton Steel & Iron Co., who were commended by Justice Teetzel recently for its system of looking after injured workmen. John Southorn, an employe, who was severely burned with molten metal, sued for $10,000 damages. An agreement was arrived at, but Justice Teetzel said he was surprised to find the company so generous in providing for an injured workman as instanced in the case.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

METAL MARKETS.

The markets have not been very staple during the month, a decline taking place both in tin and copper. Jobbing trade has been very good, showing an improving tendency all through, but weakness in the primary markets caused prices to sag despite the trade doing. Metal users have found orders generally coming along freely with the result that they have bought in larger quantities although keeping well within their immediate wants. Inquiries have been good, and there is no doubt that consumers are watching the markets closely. So far as large contracts are concerned business has been quiet, and there has been no great desire to stock up. Specifications are now being received on contracts placed some time back, and shipping is becoming more frequent as industrial activity increases.

Owing to weakness in the English tin market, prices were cut during the month to ¼c. which made the jobbing price around 31½c. Tin struck a snag during the early part of the month. The knowledge that there was plenty of metal on the market, and that stocks were heavy, brought about a strong bearing movement in London, and although at that time tin should have been showing much better strength, figures fell away. However towards the end of the month the bulls became active again, and prices rose. It may be that the tin market is in for another spell of bull controlling. If so Canadian figures will follow. Copper during the month received a cut of ¼c making jobbing prices around 15c, with shading for large sized orders. Copper has not been in a very healthy state in New York. Consumers have kept off the markets, and there is a strong movement on foot to bring about lower prices. The English market has not been strong, and this has helped the bear operators. Producers are still not seeking business, and stocks must be piling up. It is a strange fact that at a time when iron and steel production has been kept down, copper should be worked at record speed. It seems to be a contest of endurance between the producers on the one hand and the consumers on the other.

The pig iron and steel situation in the States seems in a depressed condition. Cutting has undoubtedly been going on in pig iron and in finished steel articles excepting rails. The Steel Corporations are maintaining prices, but many of the independent firms are cutting to get business, and in some measure succeeding. Undoubtedly there is not the business showing that was expected. Canadian furnaces continue to hold prices well, and are reported as being busy. Conditions in the Old Country were inclined to show weakness at the commencement of the month but the recent rise in Consols, and the general impression that trade is on the mend, have improved matters, and a stronger tone is now reported in pig iron and steel.

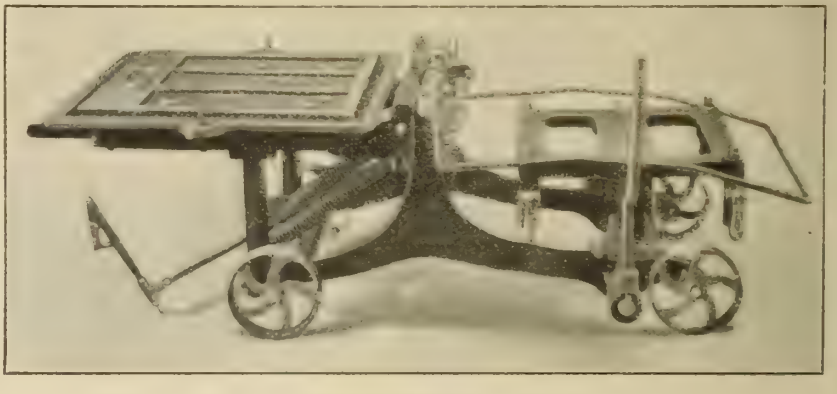
Spelter has not changed during the month, and we continue to quote $5.50. Trade has been steady, and the market appears to be in a very sound condition. Prices in the English market have kept remarkably firm, and the metal seems as strong as ever. At St. Louis there has been a slight weakness, but nothing to speak of after the way in which the prices have held. In the circumstances, a reaction is only natural. Lead at the commencement of the month in the English market was on the weak side, but later on the market improved very much, and figures rose again. The result was that lead in the Canadian market advanced 10c., and jobbing prices for imported lead became around $3.80 with Trail at $3.70.

OSBORN MOLDING MACHINE.

The Osborn rock-over down-draft molding machine was developed in the foundry of the Best Foundry Co., Bedford. This machine drops the mold away from the pattern—a straight gravity drop—that it is provided with a simple automatic adjustment at the four corners of the delivery table so that it can be easily and quickly adjusted to various depths of flasks, making each machine adaptable to a wide scope of work.

After the mold has been rammed, rocked over, the clamping device released and the machine vibrated, the workman, either with his hand or foot, pulls forward the side lever and operates cams which lower two plungers and allow the mold to drop away from the pattern. The pattern plate is fastened to the pattern frame, which is attached to adjusting guides fastened to a shaft operating in cast iron uprights. Spiral springs assist in rolling back the pattern plates. The cams are attached to the shaft to which the lever is keyed. The plungers are 3 in. in diameter and have a drop of 2 in. This with the rock-over movement permits the handling of patterns 6 in. deep.

Four depressible pins working at the four corners of the delivery table adjust themselves automatically to any unevenness in the bottom board. They work independently of each other and level the flask in all directions. The pins or posts rest on spiral springs and are depressed when the mold on the bottom board is rocked over. They are clamped in position, holding the flask true to the pattern until lifted from the floor.



Osborn Rock-over Drop-draft Molding Machine.

The machines are made in three sizes, for flasks, 18x30 in., 30 x 36 in. and 40 x 50 in., by the Osborn Mfg. Co., Cleveland.

LARGE CASTINGS.

Two large pump cylinders for the Toronto water department were cast recently in the foundry of Bertram & Sons, Dundas. These weigh respectively 22,810 and 19,320 lbs. The pumps are now being erected at the works of the John Inglis Co., Toronto.

Some Examples of Modern Molding Machine Practice

Three Classes of Molding, Bench, Side Floor and Heavy Work — Molding Pulleys, Directions for Molding Other Castings — Care Necessary in Making Cores.

By JOHN EDGAR.

The molding machine is in that stage of its development where it is being looked upon as a possibility in the average foundry. That it is meeting with that opposition which is the portion of all new methods that are of a labor saving character is an indication that it is soon to be as common in the foundry as the lathe and planer is in the shop. The molder of to-day should welcome a device which will help raise the craft up to a level with other branches of manufacturing trades. The molding machine is here and here to stay.

It has been employed in the production of small molds for such work as valves

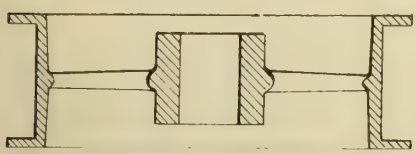


Fig. 1.—Section Through Flanged Pulley.

and pipe fittings and small machine parts. The nature of the machine used in such cases and the methods employed made it of little value in the ordinary foundry, being limited to such as work a pattern for thousands of castings in each lot, so that frequent changing of pattern and rigging of the machine was unnecessary. In the average case such as one meets in the small foundry connected with the machine-tool establishment or in the medium size jobbing foundry the frequent changing of patterns is a feature that must be accommodated.

As an example of what can be done and the conditions one meets in the ordinary foundry, a recital of what was found and the deductions made in a case where it was decided to employ, if possible, the molding machine on the run of work in a machine-tool foundry, will be worth investigating.

This foundry employed from 60 to 90 molders and core-makers, besides helpers and produced about 15 tons a day of machine-tool castings. One condition that forced the consideration of the machine proposition was the lack of production from the smallness of the equipment. The possibility of trouble with the union was also a matter that caused the management to look into the proposition.

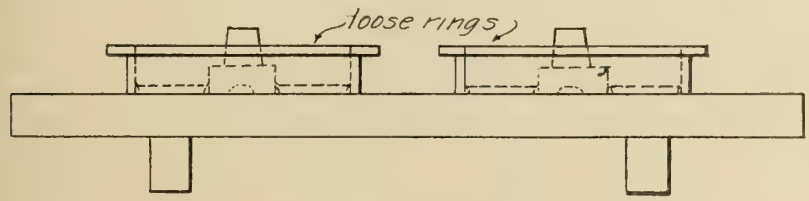

Fig. 2.—Pattern Board for Flanged Pulley.

Three Classes of Work.

The work was found to be naturally divided into three classes: bench, side floor and heavy work. Bench work was mostly all handled in snap flasks and about ten men did the work with a continual call from the stock-room for this class of castings. Side floor production was still further behind the demand and about twenty men were employed on this work. The heavy work consisting of machine frames was also badly pushed by the call for castings from the shop.

The bench work was easily handled by three power-squeezers of the split pattern type, using snap-flasks, one man to a machine. The machines were manned by unskilled help and production was up to normal after the new men had been carefully instructed. These machines are practically automatic in the molding operation, requiring attention merely to feed sand and remove the finished molds

The side floor work was next attended to and some little apprehension was felt in connect on with this department. But after summing up conditions it

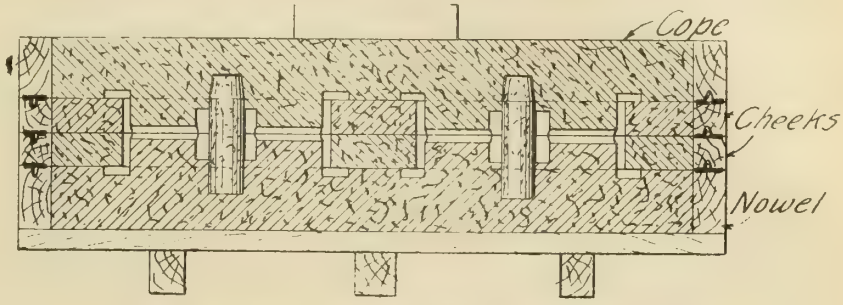

Fig. 3.—Section Through Mold for Flanged Pulley.

was decided to try a machine of the roll-over type. The sand in this type was rammed by hand similar to the hand method.

These machines consist of a main frame which is carried on truck wheels making the machine portable. The frame carries a swing-frame, which may be swung or rolled over in a vertical plane through 180 degrees. This roll-over frame is given a vertical movement by actuating a lever either by hand on the smaller machines or by air or water pressure on the larger machines. These

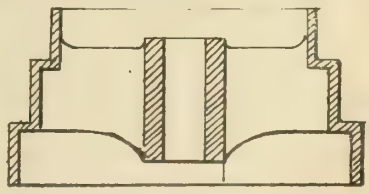

Fig. 4.—Small Cone Pulley.

two motions are obtained in a manner peculiar to the make of the machine, there being several machines on the market which operate on this general principle.

The great advantage of this particular type of machine over others is that they are more flexible than the other types and are therefore more suitable for the general run of work, met with in the medium weight casting.

The side floor work is of a class where the depth of mold varies somewhat, requiring very deep copes and some with three or more partings. In many cases the cope had to be barred, a condition

that cannot be entertained in the power running machines.

Molding Pulleys.

A large amount of the work on the side floor was that of molding pulleys and as this work is of general interest three examples have been selected as illustrations. Fig. 1 shows a flanged pulley 12" dia. by 4" face. Two of these pulleys were cast in each mold. The pattern in the roll-over type of machine is fastened to a board the surface of the board making the parting of the mold, as this pulley is symmetrical on each side of the center, it was necessary to make only one pattern board. This board is shown in Fig. 2.

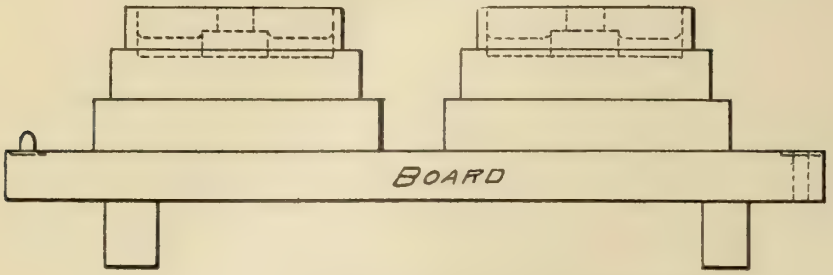

Fig. 5.—Board for Cope of Cone Pulley Mold.

On account of the flange it was necessary to make the mold in four parts with three partings as shown in Fig. 3. The cheek was rammed up first and the cope or nowel next, as the case happened to be. A cheek and cope or a cheek and nowel were rammed up together before the pattern was drawn. The process is as follows : The machine with the pattern-board attached to the swing frame is levelled up and the frame set with the pattern facing upward. The check flask is placed on the pattern-board being positioned by dowels. The sand is rammed up around the outside of the pulley pattern, up to the underside of the flange and then levelled off flush with the edges of the flask, and sprinkled with parting sand. The cope or nowel flask, as the case may be, is then placed upon the check, being also positioned by dowels and the sand is rammed into the inside of the pulley and up to the top of the flask. After striking off the sand a bottom board is clamped to the flask and pattern board, by means of wedge clamps and the flask and board are then rolled over 180 degrees bringing them other side up The clamps are then removed and the frame is moved vertically upward drawing the pattern from the sand.

The board is vibrated before and during the drawing by striking it a few sharp blows with a hammer or mall. This vibrating can be accomplished by means of air-vibrators attached to the frame when compressed air is available. It is, of course, obvious that the flange is loose on the pattern and is left in the mold when the pattern is drawn being picked out after the cheek has been removed. This example illustrates the facility with which the split pattern may be used ; any split pattern in good condition can be used on the molding machine. In fact the pattern for the above case was one that had been used as a hand pattern, and was one from which very few castings were taken at any one time. When as is often the case in pulleys and gears, the pattern is symmetrical except for the fact that the hub may be longer on one side than on the other or even of different diameter, one board may be used by making the hub loose and changing the hub as desired.

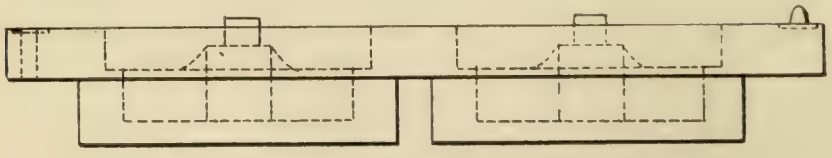

Fig. 6.—Board for Nowel of Cone Pulley Mold.

The cone pulley in Fig. 4 shows a job which is not symmetrical and which requires a change in patterns to make it of use on the machine. Fig. 5 and Fig. 6 show the boards. The board in Fig. 5 forms the outside and a portion of the inside while that in Fig. 6 forms the remainer of the inside. The mold is set up as illustrated in Fig. 7 which is a section.

Fig. 8 shows another cone pulley of similiar style, but of larger dimensions and more steps, making the mold much deeper. This was attempted entirely in green sand much on the plan given above but while it would be done it was very difficult, and as the sand could not be made always of just the proper temper, the core caused trouble. Figs. 9 and 10 show how this was eventually handled the green sand portion, shown in section, Fig. 10, being made to consist of the nowel and the dry sand core being hung on the print as shown.

This method of handling this job has long been used in hand-molding and has proved a success over all other methods of setting the core. It requires no cope or at most a blind cope. The cores are weighted so that there is no danger of them floating.

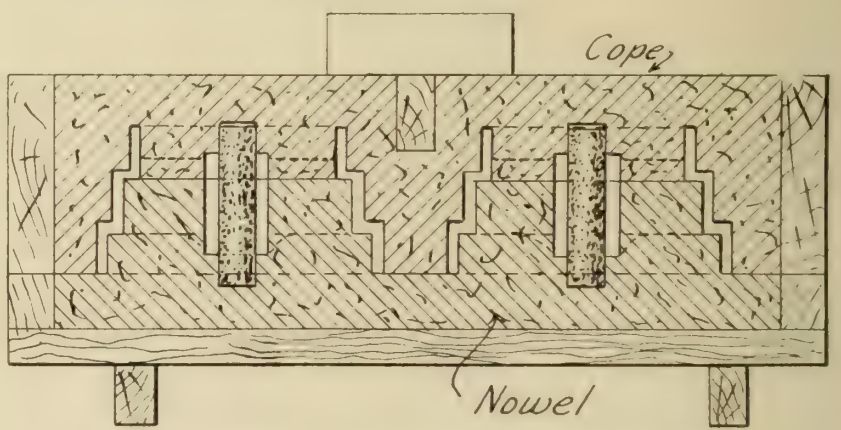

Fig. 7.—Section Through Mold of Small Cone Pulley.

In each of the examples given two castings are made in each mold. The flask was about 24" x 36" which size was found very convenient for general work. The fact that the handling of the pattern and flask in the drawing operation is mechanical, the large flask was possible.

Other examples may be mentioned but not being of such general interest they are not illustrated. They are tables, carriages, knees, gear-boxes for milling machines, and even the frames of the smaller sizes were handled on the machine. One frame weighing about 900 lbs. was handled successfully, a couple of unskilled men turning out a mold in about four hours that originally took a skilled man and helper, a whole day to do by the old method. Much better

time could have been made had the molding been done by the skilled man.

After a good deal of experimenting the process was shifted down to a systematic order, the mold being rammed and the pattern drawn by an "unskilled" man trained into handling the ramming tools and the core setting being done by a skilled man, who also supervised in a general way the work of molding. He had a couple of crews at the machines under his supervision.

In such work of irregular shape as the carriages, knees and gear boxes that one finds on the modern milling machine, much core work has to be done. Loose pieces are substituted by a core, one core in many cases eliminating several loose pieces. Where the loose piece is large and such as not to be easily lost and one that can be easily picked from the mold, the core was not used, it being deemed simpler to retain the loose piece. This applies especially to the

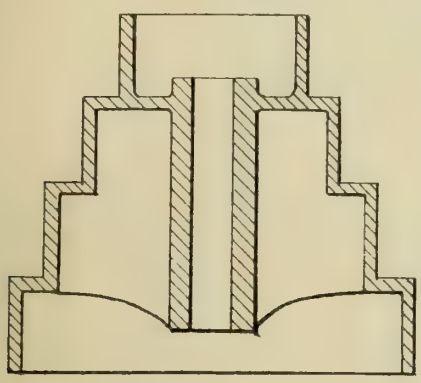

Fig. 8.—Large Cone Pulley.

large work where but few molds were made at one setting.

Changing Patterns.

The ease with which the change can be made from one pattern to another on the machine is illustrated by the following. There was one machine of large size on which a number of patterns had been fitted and as the work was in constant demand, several of the patterns had to be worked at, at the same time. Thus, a frame, a knee and a large table were cast one day, only one mold of each being set up each day, meaning three changes a day.

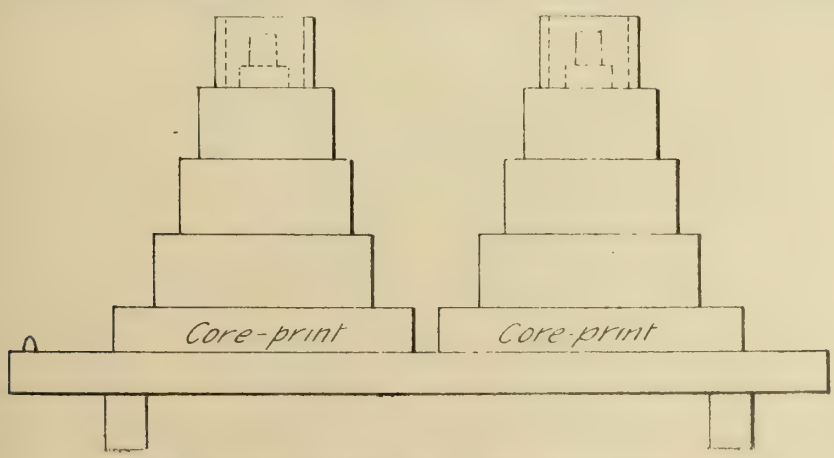

Fig. 9.—Pattern Board for Large Cone Pulley.

In summing up it was found that the greatest advantages of the molding machine over the hand-molding method are: the established parting which is obtained by the fastening of the pattern to the boards, making it possible to ram the sand around the pattern without any bedding; the straight line drawing action of the machine which does not require the skill that is required in drawing the pattern in hand-molding. The drawing action of the machine and the security with which this drawing motion is held from other than vertical direction makes it possible to draw the pattern from the sand without tearing the mold and also in the actual time saved in the operation. The guided drawing action makes it possible to vibrate the pattern sufficiently so that the sand is shaken free from the pattern without rapping the mold out of shape as is the case in hand molding where rapping of small patterns in the sand causes the enlargement of the mold of an amount equal to and in many cases more than the shrinkage. If this

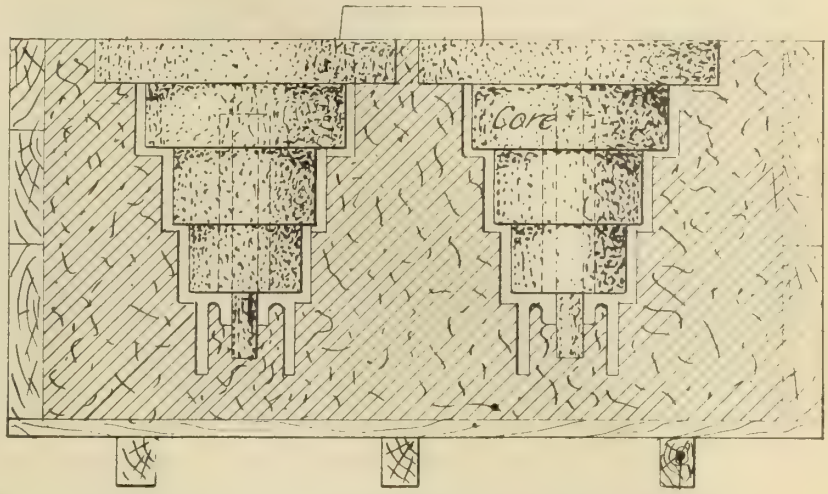

Fig. 10.—Section Through Mold for Large Cone Pulley.

rapping were always uniform it might not be so bad as allowance could then be made. Patterns have been placed on the machines that when cast show the effect of the excessive rapping that they received in hand-molding, by not having sufficient metal to finish up, the pattern having been turned down in order to reduce the turning allowance in the old hand-molded castings.

In the case of the molding machine the pattern must have good draft as the straight line action in drawing the pattern does not allow of the lateral movement that is possible in hand-drawing. There is little doubt that more draft is desirable even in cases molded by hand. Torn molds are the chief cause of lost time in molding either hand or machine. The draft is imperative in the case of machine moldings. The patterns should be given all the draft that they can stand, pattern-makers seem to think that if the pattern shows draft when tested with a square it is sufficient, but it should never be less than $\frac{1}{8}$ of inch per foot.

Cores and Core Prints.

Draft in the case of core-prints should be even more rank than in the case of the pattern and should be more on the lines of a bevel. The setting of the cores is a difficult job even when everything fits perfectly which is hardly ever the case. Lots of trouble is caused by ill-fitting cores. Much of this trouble is caused by not having the prints beveled. If a core does not drop into place the core setter will most surely use a file on it and filing of cores is a thing not to be encouraged. When the number of cores are increased to the extent that is necessary in machine-molding, every minute saved on each core amounts to a great deal in the aggregate.

Standard Fitting and Valve Company's Plant at Guelph.

The Works of The Standard Fitting and Value Co., Guelph

The Layout of the Buildings, with a Description of the Foundry Equipment, Molding Machines and Foundry Transmission Arrangements.

A Canadian industry, which has been making most satisfactory progress since it began operation on October 9th, 1907, is the Standard Fitting and Valve Company, of Guelph, Ontario. The works are now run at their full capacity, 125 men being employed, the larger number of whom, if not all, are doing skilled or trained labor.

During the past year, owing to the temporary depression which more or less affected all manufacturing concerns, there was a slackening up to some extent in the lines in which the company is engaged, but the outlook for the future is most promising and many orders from all parts of Canada are being filled.

At present only cast iron fittings are made but in the near future valves will be manufactured and placed on the market. A large proportion of the fittings turned out are used in Guelph, particularly by the Taylor-Forbes Company and the Page-Hersey Iron, Tool and Lead Works. The company began building operations in May 1907, being organized a month previously. The plant of what was the Aird-Platte Manufacturing Company (now the Aird Manufacturing Company), of Watervlett, which is situated across the river from Troy, N. Y., was taken over and, along with a large consignment of new machinery, was placed in the specially fitted up and admirably laid out buildings in Guelph. George W. Aird is the managing director and secretary-treasurer of the company, his father, Henry Aird, being president, and John M. Taylor, vice-president. Practically all the capital stock is Canadian, the bulk of it being held by residents of Guelph. At the time the company was thinking of locating in Canada offers from other places were made but the promoters decided upon Guelph for several reasons, one of the strongest being that its cast iron, steam water and gas fittings were largely required by Guelph industries for radiators and other products. All fittings are made from one eighth of an inch to ten inches inclusive, lock nuts, elbows, tees, crosses andY's, caps and lock nuts, flange and flange unions, bushings and plugs and expansion plates, as well as flanged fittings from 2½ inches to 16 inches inclusive, both standard and extra heavy.

Detail and system are observed to a marked degree in the design and plan of the buildings of which W. A. Vahoney was architect and George W. Aird the designer. The foundry is 160 x 80 feet, the tapping room 80 x 70, the shipping room 120x40, the metal and wood pattern and tool room 120 x 30, the core room 40 x 20, two storey, and the office 30 x 20. All the departments are separated by walls of solid brick and fire proof doors. The buildings while somewhat irregular in shape are modern and but one purpose was in view--that of affording the greatest facility and economy in the arrangement and working plans. The pattern shop and tool room are immediately back of the office and shipping room. The remainder of the main building, to the width of thirty feet, is given up to the machine shop with the exception of the space devoted to the tapping room, behind which are the engine room and boiler house. The cleaning room is located between the tapping room and the foundry. In a separate wing of the structure are the core room, core ovens, stock storage and cupola.

Foundry Practice.

Moulding in the foundry is entirely done by machinery. Two Berkshire molding machines, with a capacity each of 120 molds an hour are employed. The working of these machines is of interest.

The flask and bottom board having been put into position and the lever thrown, the sand is sifted in the riddle at the rear of the machine, and then conveyed in a bucket-elevator to the hopper above the machine. The flask is next automatically carried to the rear, where it is filled with sand. It then travels forward and is met in its course by the bottom board supported upon the ram, which is forced down, thereby ramming the sand. At the instant of ramming, the vibrator is automatically thrown into action, which makes impossible the formation of any vacuum, and also prevents the sand from adhering to the pattern. The lifting pins then raise the flask off the pattern. While the flask returns to receive its supply of sand, the bottom board is supported by suitable hooks, but as the ram comes down, these hooks are drawn back so that the board remains upon the mold. All the operator has to do is to lift off the

flask and set it to one side, blow the sand from the table with the air hose, and all is ready for placing the other half of the mold. The attendant may economize time at this point by placing the second half of the flask upon the machine, and throwing the starting lever before removing the half mold already completed from the bench. By the time he has removed the finished half-mold to the floor, the second half mold will also be completed, and will be ready to be lifted off. When using snap flasks and making light molds, the mold may be assembled at the side of the machine, thereby making necessary but one trip to the floor. In such case, the molder can have two sets of flasks, and arrange it so that the machine will be ramming the drag for the second mold while he is carrying the first to the floor.

The pressure of the ram upon the sand can be quickly adjusted, and as the flasks are filled automatically, every flask will be rammed alike. It is also possible to adjust the boards in such a way that the drag will be rammed harder than the cope. When making the cope, the machine is so arranged that it cuts the sprue. The pattern plates are placed in an ordinary table, or platen, at the front of the machine, and can be changed easily and quickly by removing four screws which hold the plate in position, and slipping in the new plate. One of the features is the heating of the pattern plates by gas jets from beneath, so that the molds draw readily, without the use of any parting material whatever. By this method, with the proper grade of molding sands, very fine work is made possible without any facing. Moreover, since no parting sand is introduced, the life of the molding sand is greatly increased.

Eight hand squeezing machines each with a capacity of 150 moulds a day and two stripping plate machines each with a capacity of 150 moulds a day built by the company are also part of the equipment.

Conveying Apparatus.

The main feature and most noticeable in the foundry organization is the automatic apparatus for conveying the moulds from the two Berkshire machines to the casting floor and when the castings are made to return the sand and metal, the former to a special mixing hopper and the latter to the cleaning room. The man working at the Berkshire machine can place the mold on the table of this automatic carrier, which runs the length of the foundry and which allows the mold to be taken off at whatever part of the floor they are required, as the conveyer is reversible. This allows the molds on being poured to be placed thereon and taken back over the hopper where the casting is knocked out and falls off into a car running on a trolley underneath and delivered to the cleaning department. The sand falls through the rack into the hopper where augers feed it to an elevator by means of which it is carried to the sand mixer. This sand mixer thoroughly mixes the sand and delivers it back to the floor near the moulding machines.

The lower portion of the cupola is composed ol two sheet steel shells, the inner shell being made very heavy and of the same size as the stack proper, the outer shell and encircles the inner one and is made air tight, forming the air chamber. In the outer shell are arranged two doors for shutters held in position by tap bolts, also made air tight, which may be removed and again replaced to allow for cleaning should any coke or slag accumulate in the air chamber, the air chamber is not fastened to the bottom plate, but is separate and distinct. Opposite each tuyere also is a sliding air tight gate with peephole. The tuyeres are so arranged that the blast is distributed over the entire area of the combustion chamber and are constructed in such form that the melted iron in its downward course cannot pass through them into the air chamber. The capacity of this cupola is about 15 tons an hour and a cast is made every day.

Foundry, Showing Molding Machine and Conveyor.

The raw material is delivered from the Canadian Pacific Railway siding to the door of the cupola room where it is transferred to an electrically operated elevator which lifts it to the charging floor.

Core Room.

The cores are made on the second floor of the core room, which is really

a separate building adjacent to the foundry. When made the cores are let down on a dummy elevator to the first floor, where they are baked and stored.

The castings, which are transported from the foundry by means of a trolley car, on being delivered from the automatic carrier are taken to the cleaning room adjacent. They are here cleaned in tumbling mills, which have a dust arrester attachment, which keeps the cleaning room free from dust and dirt.

Tapping Room.

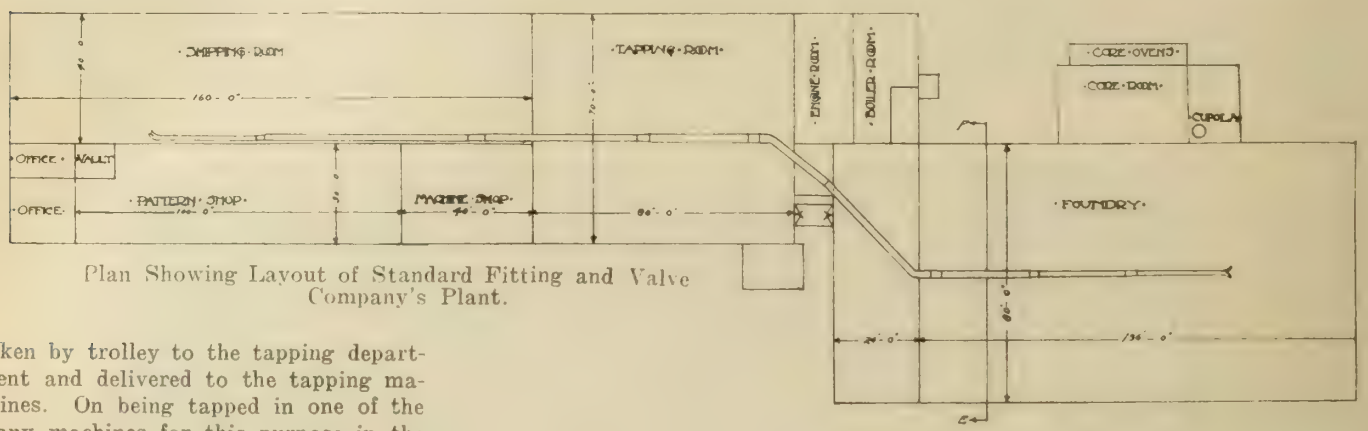
After cleaning, the castings are given any necessary grinding, whence they are taken by trolley to the tapping department and delivered to the tapping machines. On being tapped in one of the many machines for this purpose in the tapping room they are conveyed in a special metal tank to the cleaning tub. This tub is set in the floor, situated immediately over which is an air hoist. The tank mentioned, which is conveyed on a trolley, passes the various machines and collects the fittings from them in a perforated iron bucket. On being brought to the tub the air hoist lowers it into the cleaning bath where the now finished product is thoroughly cleaned. By trolley it is again taken to the stock and shipping room where the fittings are sorted and placed in their respective compartments.

One of the largest machines in the tapping room is for tapping threads four to eight inches. A notable machine is one known as the Walters three-way machine, which is the only one of its kind in existence, being built especially for the Standard Fitting & Valve Co. The taps, tees two inches and under all three ways at once. It is provided with a double chuck so that the operator may be taking out a tap tee and placing in a new one while the other is being tapped. It is entirely automatic, the lines of the fittings tapped by this machine are absolutely true when done in this machine, as the taps themselves are so adjusted as to render non-alignment impossible. The machine reverses itself and taps are withdrawn automatically, one starting after the other so that the strain on reverse does not come on one machine all at once.

Acme bolt cutting machines are used for cutting plugs and bushing. Flange unions are faced on a lathe and screwed on arbors so that the facing is absolutely true with the thread cut. The tapping of bushings is done on a four spindle tapping machine that works automatically.

The machine shop equipment includes planers, shapers, milling machines, lathes and drill press and also pattern making equipment for both wood and metal patterns.

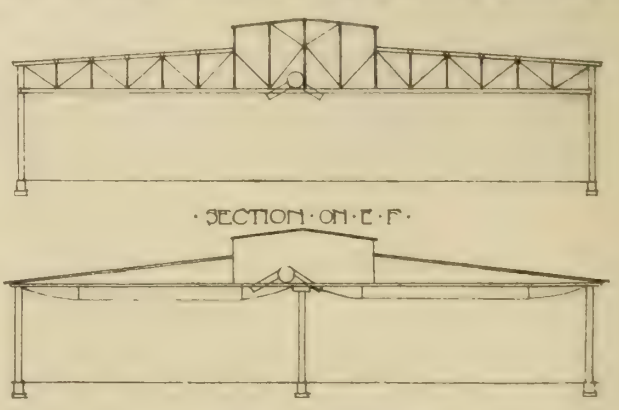
The stock room, which is a large airy department has the entire walls lined with bins to the ceiling. Each bin is 3 feet deep and 2 feet square. There are 1,000 of these bins in all. Half way to the ceiling all the way around is a platform to enable a man to reach the upper tier of bins. A Fairbanks standard scale is situated in the centre of this room. Running the entire length of the stock room is a platform from which cars may be directly loaded as the arrangement is such that the company's siding parallels the stock room.



Plan Showing Layout of Standard Fitting and Valve Company's Plant.

Power House.

The power house is equipped with a Goldie-Corliss engine of 150 h.p. of similar design to that installed in the power plant of MacGregor-Gourlay Co., Galt. The fly wheel is 11 inches in diameter with a 20 inch belt. The boiler is of 150 h.p. at 120 pounds pressure. The lighting equipment consists of a 50 h.p. generator. It supplies power for the motors, for the blower and elevator and the electric lighting of the entire plant, which consists of Nernst lamps. The ventilating and heating system is by the Dominion Heating & Ventilating, Hespeler, and includes a system of heating the entire building, except the office, by forced draught. The fan is driven by a steam engine, 12 h.p., 250 r.p.m. An air compressor is also installed for supplying power to the various compartments where compressed air is used.



Sectional View of Plant.

Deeds are mightier than words and actions louder than boasting.

Capital has been raised and a company formed to build a railroad from Victoria to Barclay Sound. The company is trying to secure certain concessions from the Government. The road will be over 100 miles long and will open up a vast timber country. It is planned to begin immediate construction as soon as concessions are obtained.

The elevator to success is generally stuck: try the stairs.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shops.

Murray & Davidson, machinists, Elm Creek, Man., have dissolved.

E. R. Hardendorf's machine shop at Brockville was burned recently.

The Huntsville Engine Works Co., Huntsville, Ont., have obtained a charter.

Emond, Vezina & Chartier's foundry at St. John, N.B., was damaged by fire recently.

M. McGuire, Dresden, Ont., has sold his machinery and carriage business to Jas. McGregor.

H. Williams' machine shop at Port Arthur was damaged to the extent of $2,000 by fire on Feb. 9.

The Canadian Foundry Company, Fort William, will make a $17,000 addition to their plant in the near future.

George White & Sons, London, makers of engines, etc., report that their staff of 160 men are working 60 hours a week.

R. Armstrong and J. Armstrong, two well-known mechanics of Revelstoke, B.C., will leave shortly for Vancouver to open a machine and repair shop.

Tallman Brass and Metal Co., Hamilton, manufacturers of brass castings, babbitt metal and solder contemplate erecting a new foundry in the spring.

Seaton Bros., New Westminster, B.C., have purchased the Crane shipbuilding yards and will immediately carry out improvements by opening a machine shop and wood-working plant.

A factory for the manufacture of Stirling Boiler Injectors for marine, locomotive and stationary boiler purposes, the invention of W. H. Stirling, St. John, may be started at that place.

The London Rolling Mills report business is a great deal better than it was last year. They are working full time, ten hours a day, for six days a week, and have 125 men. Business has been steadily improving since May last.

The G. Walter Greene Company, Peterborough, which will manufacture all kinds of sawmill machinery, has elected officers as follows:—President, G. Walter Green; vice-president, S. Greene; secretary-treasurer, T. O. Donaldson.

The Hamilton Steel and Iron Co. has secured a large order of steel for one of the mill railways in the Northwest. The order comprises 500 tons of angle iron for connecting rails, and 100 tons of railway spikes. There will be 20 carloads of steel in the order.

A tin smelter in the immediate neighborhood of Victoria will be the next development work on Vancouver Island. This will be built by the Pacific Tin Mining & Smelting Co. a concern which was incorporated on Jan. 14 of this year, and means to commence work at once.

The Silliker Car Works, Halifax, held their second general meeting recently, and the statement showed net earnings of $13,500. This was considered quite satisfactory in view of the general depression, and of the fact that the works have only been recently started.

W. J. Ellis, late of Rogers & Ellis, Vernon, B.C., has arranged to start a machine shop in Kamloops. His outht will cost about $2,000. He will carry a stock of engineer's supplies, and will handle bicycles and bicycle repairing. Mr. Ellis has had 23 year's experience in some of the largest shops in the United States and Canada.

It is the intention of the Canadian Locomotive Co., Kingston, to further increase their capacity this summer, by building an up-to-date erecting shop. The only available space now left for the company is at the northerly side of the boiler shop, and extending over and covering the extension of Earl street. The company have asked the city for a lease of the land.

St. John & Crooker, St. Catherines, have leased the building on Bradford St., Barrie, formerly used as a ladder factory, and fitted it up with modern machinery including lathes, planer, drills, etc. A foundry has been equipped with a cupola. It is the intention of the company to build saw mill machinery. Mr. St. John was formerly with St. John & Black, St. Catharines. Mr. Crooker has been in the employ of McKinnon Dash and Metal Works.

At the annual meeting of the shareholders of the Williams Mfg. Co., Montreal, Bartlett McLennan presiding, the directors' report and annual statements were satisfactory. The old board of directors was re-elected, Bartlett McLennan, Francis McLennan, Wm. Yuile, James Rodger, C. W. Davis, C. E. Tutton and Alex. Langlois. At a subsequent meeting of the new board of directors, C. W. Davis was elected president, and Bartlett McLennan, vice-president.

The John Inglis Co., Toronto, intend erecting a foundry for large work and are now negotiating for land in the vicinity of their present works. It will be about 100x200 ft., well lighted. The usual equipment will be installed. The shops are very busy at the present time. Work is going through for the Toronto water works, Edmonton water works and for the Toronto Gas and Electric Co. Their foundry work is being done at the Berg Machinery Mfg. Co. and other foundries until their own is erected which they expect will be during the coming summer.

The receiving of a portion of the construction work for the Hydro-Electric Power Commission by the Canadian Westinghouse Company will mean a big thing for Hamilton. The plant has been running on short time for a considerable period and as it employs a large number of hands the receiving of such a big order will mean the employment of full staffs and the consequent circulation of more money among the merchants. It is understood that the work has not yet been apportioned by the Government between the Canadian General Electric Co. of Peterboro, and the Westinghouse Co.

Bean Bros. have completed their new machine shop at Fernie, B.C., the whole plant being designed with a view to enlarging in the future the power plant and furnaces being double the present requirements. The main building is 40 x50 feet, two storeys high, and the moulding room 30x60 feet, all of concrete. The machine shop occupies the lower floor of the main building and is supplied with a 36-inch planer and 9-foot bed, a 42-inch lathe with 16 foot bed; a 24-inch lathe with a 14-foot bed, and a 12-foot lathe with 19-foot bed, besides a drill press. Motive power and heat are supplied by steam.

Municipal Undertakings.

Brantford will extend its sewerage system.

Sarnia is considering instaling a civic steam heating plant.

Victoria has secured $1,200,000 with which to instal a new water system.

Winnipeg will start work at once upon the construction of a $65,000 sewer.

Toronto City Engineer has recommended a number of extensions of water mains.

Point Grey, a suburb of Vancouver, proposes to introduce a water and sewerage system.

Etobicoke Township, Ontario, asks power to start a sewage disposal plant at New Toronto.

The Hull waterworks are to be extended. New hydraulic pumps will be installed and a new main laid.

City Engineer Ruttan of Winnipeg, recommends a new softening plant for the waterworks at a cost of $150,000.

The by-law to establish a waterworks system in Aylmer resulted in the ratepayers deciding to undertake the improvement.

Plans will be prepared by City Engineer Ruttan for the construction at Winnipeg of a trunk sewer for the district west of the Red river.

Price Ellison has offered to put in a water system at Vernon, B.C., for $35,000, which will give unlimited water and reduce electric light rates.

Work is to be commenced at once on a system of waterworks at Clinton, Ont. An engineer will shortly be appointed and contracts awarded.

Construction work on the central section of Revelstoke's, B.C., sewerage system will be done by T. F. Sinclair. Work will commence on April 1.

Among Toronto's estimates for 1909 is $153,000 for water mains to supply East Toronto and the high level east of the Don, and $60,000 for detection of water waste.

The G.T.P. are installing a new water system in Prince Rupert, the old plant having been found inadequate. A reservoir of 50,000 gallons capacity will be erected.

Tenders will probably be received about April 1 for the proposed septic tanks for city sewage at St. Thomas, for which the citizens on Jan. 4 voted to issue $40,000 bonds.

Mr. Fellowes, Toronto's waterworks engineer, states that in order to provide proper water supply for East Toronto it will be necessary to extend the city's high level system.

Vancouver's waterworks construction work for 1909 includes the building of the Little Mountain reservoir and its connection with the city system by the construction of five miles of mains.

City Engineer Rust, of Toronto, has recommended that J. D. Watson, Birmingham, England, and Rudolph Hering, New York, be engaged to make a report on the whole problem of sewage disposal for Toronto.

The Harbor Commissioners are considering extensive improvements to the port of Quebec. Among the projects contemplated are the installation of steam cranes on the embankment, the paving of the cross wall, the supply of water to all the wharves and an increase of the storage resources.

The purchase of several electrical pumps is recommended by Toronto's city engineer for the waterworks system. He wants two ten-million gallon electrical pumps for the high level, $60,000, two five-million gallon high pressure pumps, main pumping station, $30,000: four thirteen and a half million gallon electrical pumps, main pumping station, $150,000.

It is stated that the dredging of the Carp river will be commenced at the earliest possible date this season. The scheme is the largest drainage project ever undertaken by the county and will begin a short distance from Hazeldean, Ont., and extend nearly twelve miles to about a mile and a half west of the village of Carp. The estimated cost is $20,000.

One of the schemes that the Toronto Board of Control will consider the early part of this year is the construction of a system of overflow sewers for the city, and City Engineer Rust has been instructed by the controllers to prepare a report. It is estimated that the cost of the work will be in the neighborhood of three-quarters of a million dollars.

Willis Chipman, C.E., Toronto, has reported to the Weston Town Council in reference to the establishment of a system of waterworks. Mr. Chipman recommends an expenditure of $60,000 on the installation of a system, the source of supply to be the Humber River, the water of which is to be pumped into sedimentation basins thence through mechanical filters and on to a supply tank to be erected at the north end of the village, with a capacity of 100,000 gallons.

The town council of Notre Dame de Grace decided to purchase the property of the company which supplies water to the municipality. Henry Miles is the seller of this property, and the price named is $250,000. The supply of water is taken from Lake St. Louis, and the power house is situated at Lachine, south of the canal. The pumps furnish 1,500 gallons per minute and supply not only the municipality of Notre Dame de Grace, but also Montreal West and St. Pierre.

The Peterboro Water Commissioners are seeking permission to go to the people with a by-law seeking authority to borrow $120,000 for the purpose of erecting a new dam, a new power-house and a new pumping plant. The whole equipment will be strictly modern in every detail, and will last for many years. The pumping capacity will be trebled. 1,200 electric horse-power will be developed, 500 horse-power will be used by the Commissioners, and 700 will be available for the city.

Railway Construction.

The Kootenay Central will build 200 miles of road the coming summer.

The Great Northern will spend $3,000,000 at Vancouver this year erecting terminals.

Work has begun on the construction of the E. & N. extension from Wellington to Alberni, B.C.

The G.T.P. is planning to build branch lines into East Kootenay and the Crow's Nest Pass country.

The B. C. Electric Co. is lowering the grade on its main line between Vancouver and New Westminster.

The Canadian Pacific Railway has ordered 20,000 tons of rails from the Algoma Steel Co. at Sault Ste. Marie.

The G.T.R. has recently placed an order with the Pressed Steel Car Company, of New York, for 1,000 steel hopper coal cars.

The Saskatchewan Central Railway is seeking a charter to build five branch lines in Saskatchewan, over 1,000 miles in length.

The Atlantic, Quebec and Western Ry. is proceeding with the construction of the line from Port Daniel to Gaspe, Que., 82 miles.

Both the G.T.R. and C.P.R. are preparing plans for the Toronto Viaduct in accordance with the order of the Railway Commission.

The Tillsonburg and Southern Counties Radial Electric Railway propose to build a line running from Tillsonburg to London, Woodstock and Ingersoll.

The extension of the Central Ontario Railway from Lake St. Peter to Whitney, a distance of about 20 miles, is under construction, and work will be proceeded with during the coming season.

The Morrisburg Electric Railway has plans under consideration for beginning construction on its projected line this spring. The road will be 70 miles in length and will extend from Morrisburg to Ottawa.

The Dominion Parliament will be asked next session for an act incorporating a company to construct a railway from Victoria, B.C., by way of Otter Point and San Juan to Barclay Sound, near Sarita River.

The Heaps Telephone Company, New Westminster, are planning to construct a railway, to be operated by either steam or electricity, for the logging of their timber limits, located along the west side of Stave River.

The Pacific Northern & Omineca Railway are applying to the B.C. legislature for amendments to their charter giving the company power to construct and operate a line of railway from the junction of the Bulkley and Telkway Rivers.

Applications will be made by the Kettle River Valley Railway Company for incorporation to operate a line of railway from Midway to Penticton, B.C., a distance of about 120 miles, and from Penticton to Nicola, a distance of about 150 miles.

An up-to-date street car service is proposed for Belleville by a prominent firm of New York capitalists who will establish a city and suburban line, extending from Belleville to Trenton, through Trenton to Prince Edward County, and from Belleville to Shannonville, Thurlow and Corbyville.

A company is seeking authority to construct a line in British Columbia from Lena Island along the valley of the Honna River to Camp Robertson and Camp Wilson, and from thence to a point on Shield's Island, Rennell Sound, etc., with power to construct branch lines not to exceed twelve miles in length.

James A. Ross, president of the Dunnville, Wellandport & Beamsville Electric Railway, states that plans have been made to begin construction this spring. The road will extend from Dunnville through Wellandport to Beamsville, a distance of 23 miles. A by-law has been recently passed by Dunnville granting a bonus of $15,000.

Application will be made to the Dominion Parliament to incorporate the Arnprior & Pontiac Railway, to construct a line of railway from the Pontiac Pacific Junction Railway to Fitzroy Harbor, Ont., and High Falls, on the Kingston & Pembroke Railway, also from Fitzroy Harbor to Britannia, on the C.P.R., and to South March, on the G.T.R.

Location surveys have been made for an extension of the Quebec, Montreal & Southern Railway from Ste. Philomene, Que., to Quebec bridge, 41 miles, but that contracts will not be let until the completion of the Quebec bridge is an assured fact. Surveys also have been made for extensions to Levis, an additional seven miles; and for a branch from Becancourt to St. Lawrence River, four miles.

D. D. Mann, vice-president of the C.N.R., stated that at an early date a line would be constructed from Edmonton northwest to Fort Assiniboine, on the Athabasca River, and eventually to Lesser Slave Lake and the Peace River Crossing. It is also understood that the C.N.R. will build a line from a point near the eastern boundary to Edmonton, north of the Saskatchewan River. Another line will probably run from Strathcona to Calgary. Other important extensions are contemplated.

The Farmers Ry. is seeking power to construct a line or lines of railway from Regina to Humboldt, and thence to Melfort, from Melfort northerly along the Carrot River to the eastern side of the Province; from near the Carrot River west to Prince Albert; from near Humboldt to Saskatoon, and from Saskatoon northwesterly to the west side of the Province; from or near the south end of Last Mountain Lake to Moose Jaw, and from Moose Jaw south to the international boundary, and to extend the line from Regina southeasterly to the international boundary.

General Manager McLeod, of Canadian Northern, states that the company will make large additions to the terminal facilities at Port Arthur. Some are definitely arranged and others are in contemplation. To increase the freight storage capacity at the docks a shed is now being built over the steel dock. A new dock is to be built just south of the present dock, and on it work will be started as soon as feasible. It will be used as a steel dock during the early summer and for freight when the fall rush commences. New tracks will be laid through the yards, including lines to the new elevator to be built by Piper & McWilliams.

Electrical Notes.

A $10,000 electric light plant is proposed for Listowel.

The Electric Light Company, Okotoks, Alta., are erecting a building and installing machinery at a cost of $10,000.

The Liverpool, N.S., Town Council are considering the addition of another generator to their lighting plant.

The Saraguay Electric & Water Company, Montreal, will construct about 2 miles of transmission lines this year.

The Kentville, N.S., Electric Light & Power Co. will in the near future, install another small generator in their lighting plant.

Tenders are now being asked for two new boilers and a 200 kw. direct-connected generator for the Macleod, Alta., municipal electric light plant.

The Montreal Cobalt Power Co. expect to have 25,000 horse-power to supply users within a radius of 100 miles of Cobalt within nine months.

C. Deutcher, Vancouver, has been engaged by the management of the Tranquille sanatorium to report on the most efficient scheme for power supply at the institution.

H. K. Dutcher, of Cleveland and Dutcher, Vancouver, B.C., have been engaged by Kamloops, B.C., to make a report on a scheme for reorganizing the municipal electric lighting and pumping plant.

The committee of the Montreal City Council report in favor of seeking legislation that will empower them to buy out the Montreal Water & Power Company. The price asked by the company is about four and one-half millions.

Cecil B. Smith, one of the Hydro-Electric commissioners, has formed a company to supply electric energy to Cobalt, and the mining camps in that vicinity. He says he can reduce the cost from $150 to $50 by his scheme, which calls for an immediate expenditure of a million dollars.

The City Electrician of Victoria, in his annual report recommends the extension of the city's electric light plant by the addition of equipment having capacity for at least five hundred lights. He also recommends that a suitable building for store purposes be erected at the lighting station.

A telephone system will be built by the Hydro Electric Commission along the public highway, paralleling the course of the power transmission line and with points at every mile where connections may be made. This is to ensure facility for the linemen in communicating with the nearest sub-station in cases of accident.

An end has been brought to the long and involved dispute over the water powers of the Kaministiquia River. The Kaministiquia Power Company claimed all the rights on the river. Dog Lake is a natural reservoir toward its head, and Port Arthur and Fort William wanted authority to develop power from it for municipal purposes.

J. E. McFerran, of the Parker Electric Company, Nanaimo, has installed a 30-light dynamo for W. H. May, recently of Strathclair, Man., who has remodelled the residence on his farm at Cowichan. A Fairbanks-Morse gasoline engine was put in to supply the dynamo, and the combination has given one of the most satisfactory private lighting plants in the district.

By the introduction of new and thoroughly up-to-date cars, and an extensive addition to and re-arrangement of its car tracks, the B.C. Electric Railway Co. will soon start upon a work involving the expenditure of $100,000 in Victoria. Six new cars have been ordered. The motors will be the 440 horse-power type, and each car will be fitted with air brakes.

M. W. Beach, Iroquois, Ont., accompanied by Mr. Gilmour, electrical engineer, Toronto, are working on a plan to transmit power from Iroquois to Brockville. Mr. Beach wants to build a transmission line and to supply the water department with power. The line would pass through Prescott and Cardinal, and negotiations are being conducted with these places.

A deputation from Ottawa district waited upon the Hydro-Electric Commission to urge the erection of storage dams on the Mississippi river. It was pointed out that the generation of electrical energy by this means would be very cheap and beneficial to Carleton Place, Almonte, Blakeney, Pakenham, Appleby, and Galeta, as well as to private industries. Consideration was promised.

The C.P.R. is conducting experiments with a view to electrifying its western lines. It is proposed to commence on the mountain lines, utilizing the water-power that is running to waste on the eastern slope of the Rockies. But freezing causes a great diminution of this power in the winter, and the question is whether what is left would prove sufficient to operate the main line during the winter season.

The Seymour Power & Electric Company, Campbellford, is placing contracts for the construction of a power house there. When complete it will develop 4,000 horse-power, and contracts for the more important machinery have already been made with The Canadian Westinghouse Manufacturing Company, The Canadian General Electric Company, Wm. Kennedy & Sons, and The General Electric Company of Sweden.

A bill introduced by Hon. Adam Beck, chairman of the Hydro-Electric Commission, has been passed by the Ontario Government giving the Government authority to build a dam at Dog Lake to raise the level of the river, provide a large storage, increase the water power and give an equal flow during the year. It is understood that on the completion of the dam the powers it provides and creates will be administered by the Hydro-Electric Commission for the benefit of all concerned.

The Nepean Bay section of the new Ottawa aqueduct is practically completed. It is the intention of the power owners shortly to raise the level of the bay by a foot and a half by utilizing stop logs, and as this would flood out the cofer dams of the aqueduct, operations are being rushed. The cost of this section will be about $50,000. An expenditure to that amount has been authorized by the Railway and Municipal Board and application will be made for authority to finish it by constructing a canal down Ottawa street and on to the pump house.

The people of Middleton, in the Annapolis Valley, N.S., are considering the question of a lighting plant for the town. There is a small water fall of about twenty-five feet on the Annapolis river at Lawrencetown, about six miles below Middleton, from which they could develop about three hundred horse-power or more. They propose acquiring this, and building a power house, transmitting the power to Middleton. If Lawrencetown will fall in with the proposition, they can also secure their lighting from this source. At the present time, there are no electric lights in either place.

It is rumored that in the event of Hamilton entering into the Hydro-Electric project that city will be made the central distributing point for the power supply. The prospects for such a big undertaking are much brighter since the City Council revoked the contract made with the Cataract Power Company and decided to leave it to the ratepayers to say whether a new contract should be made with the above power company or with the Government power corporation. Should Hamilton be made the headquarters for the building of transmission lines and the distribution of power, it will be of vast importance to the city.

In view of the very large development of water power which will result from the completion of the Trent Valley Canal across the Province of Ontario, from the Georgian Bay to Lake Ontario, the Minister of Railways and Canals has thought it well that a policy should be laid down which will ensure the sale of this power to individual users at reasonable rates. Where power from the Trent Canal therefore is being sold to the public in electric energy or other form, power is being placed in the hands of the Board of Railway Commissioners to regulate the prices which the public will have to pay for it. This will apply to existing power works as well as to those which are established hereafter.

W. Kennedy, jr., Montreal, has submitted to the Peterboro Water Commissioners, plans for

the proposed new dam and power house. The plans call for a pumping plant of one new unit of three million imperial gallons capacity per 24 hours when pumping against 115 pounds pressure in the air vessel, also the two 2½ million gallons each pumping units in the present pump house. The new unit will be first installed and set to work, after which the old units will be repaired, if necessary, and removed to the new pumping station, thus providing an uninterrupted water supply to the town. The pumping capacity will then be 7½ million gallons per day with provision in the pump house for an additional unit of 3 million imperial gallons per day, thus ultimately providing for 10½ millions per day. The estimated cost of the dam, with bridge, power house, intake cribs, 7,500,000 gallons capacity pumping plant, installed complete, with suction and discharge pipes, is $117,000.

Structural Steel Notes.

The cemetery bridge at Stratford will be rebuilt.

It is proposed to widen Dundas street bridge, Toronto, at a cost of $47,000.

Tenders will shortly be called for a bridge at the foot of Bathurst street, Toronto.

The Algoma Bridge Co. is erecting a new bridge across Elbow river at Calgary.

The bridge recently destroyed by fire at St. Felicien, Que., will be rebuilt by the Government.

It is stated that work upon the proposed trans-Niagara bridge at Niagara Falls will be commenced early this spring.

A recommendation has been submitted to the Stratford city council in regard to the site of the proposed new Grand Trunk Railway bridge.

Projects at Oak Bay, B.C., include the erection of bridges across the Thames river, on Cadboro Bay road, and at Beach Drive, Shoal Bay.

It is understood that the C. P. R. will replace several of the wooden trestles between Vancouver and Shawinigan Lake by steel structures.

Plans are now being prepared by Waddell & Harrington, Vancouver's consulting engineers, for the new bridge to be erected on Cambie street.

At a recent meeting of the Portage la Prairie, Man., Board of Trade a resolution in favor of the construction of an overhead bridge was drawn up.

City Engineer Rust recommends the construction of a new bridge over the Don at Winchester street, Toronto. The new bridge will cost $15,000.

A joint railway and ordinary traffic bridge is proposed to be built across the Second Narrows at Vancouver. It is estimated the bridge would cost $600,000.

The new steel bridge to be erected at Van Vlack, in Simcoe County, will be 300 feet long and built on concrete piers and abutments. It will cost about $15,000.

The Railway Board have made an order that the T.H. & B. and the C.P.R. shall file plans immediately for the construction of a modern bridge over Garth street at Hamilton.

Thos. Murray, Quebec, has submitted to the Quebec Colonization Department a project for the construction of a bridge over the River Quinze in Temiskaming at an estimated cost of $30,000.

Tenders are being called by the British Columbia Provincial Government for the completion of a traffic bridge over the Columbia River at Revelstoke. Separate tenders are being called for the iron work.

The employees of the W. P. McNeill Company, New Glasgow, N.S., have placed in position the first steel for the new spans of the Fredericton-St. Mary's highway bridge. The span nearest the St. Mary's shore is being commenced first.

The contract for the construction of the 13-story Arcade building at Vancouver has been awarded to the Dominion Bridge Company, Montreal. Work is to commence April 1st, 1909, and the building is to be complete April 1st, 1910.

City Engineer Smith of Regina, is submitting to the Board of Railway Commissioners plans for the proposed Broad street and Albert street subways. The estimated cost of each subway is $85,000. They will have a span of 100 feet and a width of 94 feet, with provision for six railway tracks.

A project now under consideration at St. John, N.B., is the building of a bridge across the harbor at an estimated cost of three quarters of a million dollars. Plans are being prepared by F. W. Holt, and the Dominion and Provincial Governments are expected to co-operate with the city in the undertaking.

A new international bridge is proposed to be built at Niagara Falls a short distance below the Grand Trunk bridge now in use. The Canadian commissioners are William German, M.P., James Bampfield, John Bampfield and C. S. Warner, and the American commissioners, Harry Nichols, John L. Nice, M. J. Maloney and Lewis Hinkey.

The contract for the building of a dam, bridge and lock at Lindsay, upon which several Peterboro contractors tendered, has been let to J. Ritchie, a Western Ontario contractor. It is understood that the amount of the contract is between $40,000 and $50,000. Work will be commenced upon the contract as soon as the weather conditions will permit.

In connection with the appropriations for the Canadian Pacific Railroad work on the Pacific division during the coming summer, H. J. Cambie, consulting engineer of the company, states that one of the principal items in the estimates is for the construction of steel bridges along the main line and on some of the branches in the interior. The expenditure on this division on account of these bridge projects will be very large.

Planing Mill News.

The Lewis Miller Co. will probably build a large sawmill at Jordan Falls, N.S.

The Carnegie Mining Co. are erecting a saw mill at Port Perry, Ont.

T. R. Brigham, Vancouver, will erect a large saw mill at Port Essington, B.C.

The Dawson Lumber Company's mills at Yarmouth, N.S., are resuming operations.

A number of big lumber mills will be built on Fraser River, B.C., during the next three years.

W. E. Walsh recently leased the old cannery at the end of Third Avenue, Vancouver, and fitted the building up with the latest and most expensive machinery, as a sash and door factory. He reports that business in their line is decidedly good.

The Fernie, B.C., Lumber Company's new mill to replace the one destroyed in the recent conflagration, is now in operation, and is cutting and shipping lumber. The entire plant is not yet completed, but it will have a capacity of between 50,000 and 60,000 feet per day.

Building Operations.

Point Grey, B.C., will erect a municipal hall.

Ambrose Eisenhaur is building a carriage factory in Mahone Bay, N.S.

Shipyards costing $500,000 will be built this spring at Sault Ste. Marie.

The Rowden Manufacturing Co. will build a furniture factory in Guelph.

The new $200,000 Collegiate Institute proposed for Winnipeg will be built this year.

St. Matthew's Anglican congregation, Brandon will erect a new and larger church.

J. G. and E. Y. Lightheart, Vancouver, will spend $15,000 on a block of dwellings.

Two new wings to cost $70,000 will be added to the Home for Incurables at Toronto.

The Imperial Storage and Cartage Co. will build a $20,000 storage warehouse at Toronto.

The Hammond Potato Machinery Co. are rushing to completion their new factory in Galt.

A new transportation building to cost $56,000 will be built on the Exhibition grounds Toronto.

The Canadian Pacific Railway will rebuild their station at Bristol, N.B., at an estimated cost of about $3,000.

Tenders will be called immediately for the erection of the new Provincial Asylum for the Insane, to be erected at New Westminster.

R. R. Barbor, Toronto, has prepared plans for a two-story brick factory to be erected for M. P. Warren, at an estimated cost of $5,000.

Gregoire & Audet, Sherbrooke, Que., are preparing plans for the erection of a new parish church to cost $15,000, at North Hatley, Que.

The British Columbia Telephone Company have completed plans for a new office building at Grand Forks. Work will be commenced in the spring.

The G.T.P. will erect additional freight sheds at Melville, Sask., in the spring. Electrical generators to supply light and power will be installed.

The by-law asking that a bonus of $10,000 be granted the Wormwith Company to rebuild the plan factory, was carried by Kingston ratepayers by a majority of 641. Building operations will be commenced in the spring, and in the meantime another building is being used.

Extensive building operations in Hamilton are planned for the near future. The Meriden Britannia Company is calling for tenders for the erection of an addition to their building. The Imperial Bank is contemplating the erection of a large office building on which it is thought work will be started early in the spring. Another prospective building is a new Grand Trunk station.

General Manufacturing News.

J. C. Felger will erect a 35,000 bushel elevator at Calgary.

The Seeley Mfg. Company will erect a $15,000 factory at Windsor.

The Dominion Copper Co. propose to resume operations immediately.

The Empress Mfg. Co. will erect a $20,000 addition to its plant at Vancouver.

The Halifax Fish Company's factory at Dartmouth, N.S., was destroyed by fire.

Work has commenced on the construction of the new C.P.R. sheds at Vancouver.

It is definitely stated that the burned Globe Casket Works will be rebuilt at London.

The International Harvester Co. will erect a $40,000 four storey warehouse at Calgary.

The Gould Broom Manufacturing plant at Kingston, Ont., was recently destroyed by fire.

The Sayward mills at Victoria, B.C., are running again with a complete outfit of new machinery.

The North American Bent Chair Co. are making extensive additions to their buildings at Owen Sound.

The McGillivray Creek Coal and Coke Co. will instal a $200,000 plant on its property at Coleman, Alta.

The box factory at Brantford, Ont., owned by W. J. Hampel was destroyed by fire recently at a loss of $16,000.

The Montreal biscuit factory owned by G. N. Pichet, was recently destroyed by fire at an estimated loss of $10,000.

The Grand Trunk Railway are stated to be preparing plans for the erection of several concrete elevators along their system.

The Alberta Clay Products Co. will erect a factory for the manufacture of sewer pipe at Medicine Hat almost immediately.

The Maritime Mfg. Co., whose premises were destroyed a year ago at Pugwash, N.S., will begin operations again at Halifax.

The Hobbs Manufacturing Company will shortly rebuild the glass works at London which were destroyed by fire some time ago.

It is reported that the T. & N. O. Railway Commission has decided to erect a car repair shop and a pipe-casting shed at North Bay.

The Erie Basket Co., of Leamington, has recently added to its plant by installing machinery for the manufacture of all classes of handles.

The last of the machinery for the Western Explosives, whose factory will be on Bowen Island, B.C., has arrived, and when placed in position manufacturing will begin.

E. J. Taylor, a member of West, Taylor, Bickle Co., Norwich, manufacturers of brooms, has withdrawn from the partnership and will manufacture these articles in Montreal.

The Vancouver Milling and Grain Co.'s elevator was recently destroyed by fire, the loss amounting to $100,000. It is stated that the company will rebuild as soon as possible.

The Mitchell Cooperage, of Chelsea Green, a suburb of London, the directors of which control a large basket factory in Ridgetown, intends establishing a basket industry on a large scale.

The McLeod Pulp & Paper Mills have statrted to manufacture boxboard at Milton, Ont., and intend to manufacture paper in the near future. The pulp mills of this company are turning out about 80 tons of pulp per day.

The Humane Horse Collar Co., of Omaha, Neb., is starting a Canadian branch in Hamilton. It has taken over the building formerly occupied by Gompf's Brewery Company.

The Victoriaville Furniture Co. have had to run overtime three days per week to keep up with orders. They have just added a two storey wing, and are installing additional machinery.

The Dominion Telephone Mfg. Co., Waterford, has placed an order for 200,000 sand lime bricks with Schultz Bros., of this city. They intend erecting an addition to their present plant.

The Ottawa Paint Works have moved into their new building on Wellington St., and are installing the most modern paint machinery. The new premises are large, well planned and fireproof.

The Point Ann Quarries, is the name of a new company which is doing a large quarrying business at the Point, near Belleville, now famous for cement production. The head office and storage plant will be in Toronto.

Robert Richardi, of Arnprior, Ont., has been in Woodstock, N.B., looking into the matter of establishing a factory there for the manufacturing of clothespins. The idea is to purchase a mill now operated by James Carr and to instal new machinery.

Benjamin Broughton, John S. Broughton and Joseph Wheeler, formerly of the Hamilton Stamp & Stencil Company, are among the incorporators of the Superior Manufacturing Company, of Toronto, which will also manufacture stamps and stencils.

Additional machinery is being installed by the Kelowna Saw Mill Company so as to manufacture boxes for packing fruit in. This part of the plant will be ready for this season's trade. A new planer and conveyor are also being put in the sawmill.

Delahey Bros., Pemboke, Ont., proprietors of the National Manufacturing Company, which was recently burned out, have taken over the plant of the Cossitt Company, makers of agricultural implements, Brockville, and will make large extensions to the factory.

The McCaskey Register Company of Alliance, Ohio, has decided to locate its Canadian branch in Hamilton, and has secured the premises at the corner of Rebecca and Hughson streets. It will there manufacture for its Canadian trade account registers and other patented articles.

A report is current in Owen Sound that W. P. Telford, is endeavoring to interest a large American ship-building concern in a project for the erection of a modern dock there. The undertaking would include the erection of a large shipbuilding plant. The total cost has been estimated at $500,000.

The Imperial Steel & Wire Company, Coling wood, are preparing to take up the manufacture of screen doors and windows, green wire cloth, poultry netting and wire fencing. The necessary buildings and machinery will be made ready this year and manufacture commenced in time for next season's trade.

The Tudhope-McIntyre Company, a combination of the Tudhope Carriage Company, Orillia, and W. H. McIntyre, president of the W. H. Riblinger Company, Auburn, Ind., who make a specialty of high wheel motor carriages will manufacture this line of goods extensively in Orillia during the coming season.

The Western Elevator Co. represented by Mr. Read, late President of the Consolidated Elevator Company, has asked Fort William for exemption from taxation for a period of ten years on an elevator they intend to construct there early this year. The request was granted, and a by-law will be submitted to the ratepayers.

The Sanderson-Harold Co., of Paris, Ont., have a number of hands employed in the Plow Company works getting things in shape for the re-starting of the works. The office staff have taken up their quarters in the market building, which is also undergoing slight renovations to suit the needs of the various departments of the company.

Twenty carloads of machinery have been received for the new plant of the Nicholas Chemical Company, now under construction near Barnet, on Burrard Inlet, B.C. C. W. Nichols, president, before leaving for New York, stated that the plant will be in operation in two or three months. The raw material will be imported from Japan.

George White & Sons, London, have decided to extend their plant on Cabell Avenue. The firm has built a large factory on Cabell Avenue, south of the Grand Trunk, and the building is now used as the woodworking department. The intention is to remove at least one department to the east end each year, as the firm is cramped for space in its downtown factory.

With the coming of spring there is a movement among the mining men, and soon operations on many properties on the coast and in the interior will have been resumed. F. T. Hamshaw, a large operator in Atlin, is taking with him a considerable quantity of machinery. D. A. Matheson, general manager of the Yukon Basin Gold Dredging Company, and the Stewart River Gold Dredging Company, closed a deal for the construction of a large dredge, which will be shipped north.

New Companies.

McBurney Lumber Co., Toronto; capital, $50,000; to manufacture lumber. Incorporators, J. McBurney, H. H. Shaver and Jno. Gray, Toronto.

Novelty Woodworking Co., St. John; capital, $20,000; to manufacture lumber. Incorporators, H. R. Ross, J. H. King and H. E. Figsby, St. John.

Union Bag Co., Montreal; capital $99,000; to manufacture all kinds of bags. Incorporators, M. Jacobs, H. F. Watson and H. S. Williams, Montreal.

Northern Explosives Co., Montreal; capital, $250,000; to make explosives. Incorporators, A. J. Brown, R. C. McMichael and P. O. McMurtry, Montreal.

Blairton Iron Mines, Toronto; capital, $40,000; to crush ores, etc. Incorporators, J. L. Ross, A. W. Holmsted, T. A. Silverthorn, all of Toronto.

Sanders & Bell, Ltd., St. Thomas; capital, $40,000; to manufacture woodenware. Incorporators, A. R. Sanders, F. C. Bell and Ada E. Sanders, St. Thomas.

The Lindman Truss Co., Montreal; capital, $50,000; to make trusses and artificial limbs. Incorporators, A. Lesage, J. T. Finnie, and A. R. Griffith, Montreal.

The Perfect Skewer Co., West Toronto; capital, $40,000; to manufacture woodenware. Incorporators, S. W. Hooper, R. E. Black, and D. Kennedy, West Toronto.

The Rixon, Ainslie, Stoddart Co., Owen Sound; capital, $200,000; to operate saw-mills. Incorporators, H. Rixon, J. G. Ainslie and W. Stoddart, Owen Sound.

Dawson & Co., Montreal, capital $75,000; to manufacture hydraulic and electrical machinery. Incorporators, J. A. Dawson, C. G. Buch, T. B. Gould, all of Montreal.

Continental Oil Co., Winnipeg, capital $50,000; to carry on wholesale and retail oil business. Incorporators, T. Anderton, E. Liebel, J. Anderton, all of Oil City, Pa.

Household Economy Co., Toronto; capital, $40,000; to manufacture household articles. Incorporators, A. C. Bedford-Jones, R. W. Hart and O. H. King, Toronto.

Church & Fee, Montreal; capital, $450,000; to engage in saw-milling and pulp-making. Incorporators, T. E. Fee, E. S. Fee, St. Hyacinthe, and G. H. Church, Montreal.

Luttrell Gold Separator Co., Woodstock, Ont., capital, $100,000; to manufacture mining machinery. Incorporators, W. T. Parke, J. D. Luttrell and J. D. Hood, Woodstock.

L. J. Hetu, Ltd., Lanoraie, Que., capital, $75,000; to manufacture boots, trunks, etc. Incorporators, L. J. Hetu, Lanoraie, and A. Ecrement, J. B. D. Legare, Montreal.

The Canadian Vault Co., Toronto; capital, $50,000; to manufacture caskets and burial vaults. Incorporators, E. C. Davis, O. H. Holderer and C. W. Holderer, Toronto.

H. L. Bowers, Ltd., Port Hope; capital, $40,000; to manufacture building, foundry and sanitary supplies. Incorporators, H. T. Bush, A. E. Pipher and H. L. Bowers, Port Hope.

Superior Mfg. Co., Toronto; capital, $40,000; to manufacture stamps, stencils, tools, dies and machinery. Incorporators, W. E. Irons, G. Pettet, Toronto, Jos. Wheeler, Hamilton.

Filters, Ltd., Toronto; capital, $40,000; to manufacture filters and contrivances for purifying water. Incorporators, W. H. Warrington, N. B. Darrell, J. R. L. Starr, all of Toronto.

The Nasmith Baking Machine Co., Toronto; capital, $100,000; to manufacture ovens and machines for baking. Incorporators, J. D. Nasmith, A. H. Rodgers and S. Turner, Toronto.

Canadian British Insulated Co., Montreal, capital, $50,000, to manufacture wires, cables and electrical apparatus. Incorporators, L. S. F. Grant, J. J. Creelman, H. Brown, all of Montreal.

Simplex Concrete Piling and Construction Co., Montreal, capital, $75,000; to engage in contracting business. Incorporators, E. J. McCuaig, G. E. McCuaig, C. H. Lewis, all of Montreal.

Mexican Northern Power Co., Montreal; capital, $10,000,000; to carry on business of electric light, heat and power company. Incorporators, W. J. White, A. W. P. Buchanan, Saumarez, all of Montreal.

The Waste Products Refining Co., West Toronto; capital, $35,000; to manufacture and clean engine waste and make oils, paints, etc. Incorporators, G. H. Bostock, J. F. Mitchell, R. J. Richardson, all of Toronto.

The Hill Electric Switch and Mfg. Co., Montreal; capital $20,000, to manufacture machinery connected with electrical uses. Incorporators, J. J. Dougherty, N. Desjardins, J. DeG. Beaubien, E. J. Turley, all of Montreal.

The Brantford Foundry and Development Co., Brantford; capital, $40,000; to manufacture iron casting machines, implements and tools of all kinds. Incorporators, W. B. Burrill, J. B. Rouse, and J. Moffatt, Brantford.

Producer Gas Construction Co., Toronto; capital, $200,000; to manufacture oil and gas machines and devices for use of light, heat and power. Incorporators, H. R. Ivor, J. R. L. Starr, J. H. Harvey, all of Toronto.

Ben Hur Truck Co., Hamilton; capital, $20,000; to manufacture hand trucks, furniture, boxes, metals, plated ware, wheels, etc. Incorporators, F. R. Close, W. M. Findlay, T. A. Henderson, C. H. Snyder, all of Hamilton.

Watt Hose and Pipe Coupling Mfg. Co., Woodstock; capital, $100,000; to manufacture couplings, nuts, screws, brass goods, machinery, and hardware specialties. Incorporators, W. J. Watt, G. E. Phillips, J. A. McDonald, all of Woodstock.

A charter has been granted to the Labrador Pulp & Paper Company, Montreal, Que., capital, $1,500,000. Incorporators, E. Hutcheson, J. A. Richards and B. Stephens, all of Montreal, Que., and R. Smith and E. H. Weatherall, both of Westmount, Que.

Trade Notes.

The Dominion Foundry Supply Co. are installing an electric traveling crane in the O'Brien Mine at Cobalt.

The mines at Cobalt are again showing signs of activity. A great deal of machinery is being installed in many of the mines.

The Parkin Elevator Co., of Hespeler, have completed the work of replacing fire escapes on the Galt town hall and opera house.

The Crocker-Wheeler Co's tender for machinery required for Edmonton's powerhouse extension was accepted, the price being $1,100.

M. Beatty & Sons, Welland, Ont., have received from the Dominion Dredging Company an order for a large dredge, 42 feet wide, 120 feet long, and 11 feet deep.

The Winnipeg Electric Railway Company have awarded to J. A. Dawson, of Montreal, a contract for 30 brill steel trucks for new cars now in course of construction.

The Goulds Pump Company, Montreal, have booked an order from the T. Eaton Company, Toronto, for eight triplex electric pumps to operate their elevator plants in Toronto and Winnipeg.

The following firms tendered for castings, etc., for Victoria's waterworks: Victoria Machinery Depot, B.C. Foundry & Engine Works, and Adams & Parsons. The Victoria Machinery Depot were awarded the contract as lowest tenderers. Contract for fire hydrants was awarded to Hutchinson Bros.

The Hamilton Steel and Iron Company has received an order for about twenty carloads of steel for one of the Hill railway enterprises that is being conducted in the North West. The order comprises about 300 tons of steel angle irons for connecting rails, and about 160 tons of spikes for spiking rails to the ties.

Northern Engineering Works, Detroit, have recently supplied traveling cranes to Black Hills Traction Co., Deadwood; one 3 ton to the New Phoenix Foundry & Machine Co., Springfield, Mo.; one 15 ton to the City of Oswego, Oswego, N.Y.; and two 7½ ton traveling cranes to the Western New York Construction Co.

The Schaake Machine Works, New Westminster, has completed its first consignment of twenty Johnston shingle machines which were ordered by the Davidson Ward Lumber Company for its mill at Loughborough Inlet. The machines will be installed under the superintendence of Mr. Whitney, of the Whitney Engineering Company, of Tacoma.

The Ontario Wind Engine & Pump Co., Toronto, manufacturers of Gravity Molding Machines, have sold one large power machine to the G.T.R. Montreal Shop, also one to Messrs. Reid & Brown, foundrymen, Toronto. The C.P.R. are also now installing one at Winnipeg. This company have also sold two "Parks" Molding Machines, to Canadian Foundrymen. These two types of Molding Machines are manufactured in Canada.

The Montreal Water Committee have awarded the contract for a steel flume, with a sluice gate, to the John McDougall Company for $4,639. The two large sluice gates, about nine feet in diameter, for the new water conduit were given to the Coffin Valve Company, of Boston, for $2,556. Both tenders were the lowest. Some thirty inch and thirty-six inch gate valves were divided up between Drummond, McCall & Company and the Canadian Fairbanks Company.

The Hamilton Fire and Water Committee awarded contracts for supplies for the department. Those for pipes and castings were: Tallman Brothers, lead pipe at $4.40 a hundredweight; Gartshore-Thomson Pipe Foundry, cast iron pipe at $32.50 a ton, castings at $1.95 a hundredweight; Fairbanks Company, valves at $59.29 a hundred for 12 inch, $9.40 for 6 inch, and $6.18 for 4 inch; Smart Turner Company, hydrants at $44.70 a ton; Alexander Hardware Company, jute packing at 7½c.

Herman Boker & Co., New York, have established a branch office in Montreal at 332 St.

James street. This office will be under the management of Frederick E. Rejall and will carry a full stock of all grades of tool steels, including "Novo" high speed and Intra" steel. The stock will also include nickel in sheets, bars, etc., nickel alloys, nickel plated steel sheets and music wire for springs. Wm. Abbott who has represented this company in Canada for a long time will act, as heretofore, as sales agent for Novo, Intra and self-hardening steels, in conjunction with the new office.

The contract for an 1,800 horse power steam engine at a cost of $27,800 f.o.b. Edmonton, has been awarded to Goldie & McCulloch, Galt, Ont. The new engine is designed to operate a 1,000 kilowatt alternator which was purchased from the Canadian General Electric Company for $14,300. Tenders were submitted for both gas engines and steam engines, but acting upon Commissioner McNaughton's report the Council unanimously decided in favor of the steam plant. According to the Commissioner's report the cost of a steam plant, together with all auxiliaries, would be $74,350, while a gas producer plant of the same capacity would cost over twice that amount.

Series of Blotters.

The Hamilton Facing Mill Co., Hamilton, are issuing a series of blotters of art designs. These illustrate paintings of famous artists reproduced by three color process. They are very attractive and will be sent to any reader of Canadian Machinery sending his name and address.

To Manufacture Fire Brick.

The Scotia Fire Brick Co. has been organized to manufacture fire brick at Coxheath near Sydney, C.B. The president of the company is E. E. Shaw, of Shaw & Mason, C.B., C. M. O'dell, C.E., is vice-president and Ross Thompson, Sydney, is secretary-treasurer. The company is capitalized at $100,000 and a plant will be erected at an early date.

Complete Railway Map.

The Canadian Fairbanks Co., Montreal, have published a complete railway map of the Dominion. It has a full index and shows the stations of all the railways in the Dominion—the lines themselves being drawn in colors—black, blue, red, yellow, each road. The attached calender is illustrated by various railway supplies for which the company are the agents.

New Steel Furnaces.

Manager Franz of the Lake Superior Corporation, which was recently taken over by English capitalists, states that the company will immediately commence extensive additions to the open hearth furnaces at the Algoma Steel plant in the Canadian Soo. Other improvements are to follow. It is reported that the company will erect a new blast furnace and a structutal steel plant.

Calendars for 1909.

The Dominion Foundry Supply Co., Montreal and Toronto, have issued an attractive calendar for 1909. The picture above the calendar represents a speeding automobile in which is sitting a pretty girl and a very much surprised gentleman who has been thrown to the ground, his basket of apples being scattered broadcast by the rushing car. The Dominion Foundry Supply Co. are supplying the trade with copies of this calendar.

Winnipeg Exhibition.

General Manager A. W. Bell has given out the following information in regard to light agricultural motor competition at the Winnipeg Industrial Exhibition, July 10 to 17. "It has been decided to put on a class for steam engines of a higher power than 75 horsepower, and a class will be provided for this style of engine, over 75 horsepower and limited to 120 horsepower. From present indications this promises to be one of the greatest competitions, if not the greatest competition, that has taken place in North America."

Transcontinental Shops.

There is still time to send tenders for the Winnipeg shops and attention is again called to the specifications of the Transcontinental Railway Commissioners. Sealed tenders will be received at Ottawa until 12 o'clock noon by P. E. Ryan, secretary, for the construction and erection complete, in accordance with the plans and specifications of the Commissioners, of shops east of Winnipeg.

Plans, details and specifications may be seen at the office of Mr. Hugh D. Lumsden, chief engineer, Ottawa, Ont., and Mr. S. R. Poulin, district engineer, Winnipeg, Man.

$400,000 Sewing Machine Co.

A new company has recently been formed in Montreal called the Arbetter Felling Machine Co. of Canada, Ltd., and issue of capital stock will be made in the course of the next week or two. Some of the machines are in commercial operation in Montreal. The company manufactures and has the sole rights of a sewing machine which makes a blind lock stitch, that is to say it does not sew right through the cloth as deep as an ordinary machine and does exactly the same as the housewife with her old-fashioned needle. The capital of the company is $400,000, divided into $200,000 seven per cent. cumulative preference stock and $200,000 common stock. The preferred stock will be issued at par, and will carry a bonus of common stock.

Waterman's Canadian Factory.

The new factory of the L. E. Waterman Co., Montreal, was formally opened on Friday, Feb. 12. As it was a holiday in New York, a special car brought all the heads of the departments of the New York office to participate in the

opening. The date was also the 25th anniversary of the foundation of the business.

The factory which is built entirely of reinforced concrete, is 85 ft. x 100 ft. and has three storeys and basement. The arrangement of the machines lends itself admirably to keeping the building clean and one is impressed upon entering, with the neatness of the surroundings.

Westinghouse motors, on each flat, operate the machinery which is naturally very light considering the nature of the product. The power is generated by a 60 K.W., 600-volt, 60 cycle, 3 phase Crocker-Wheeler machine, running at 1200 revs. belted to a Belliss and Morcom compound engine, running at 550 revs.

Steam is generated by two Robb return tubular boilers 54 in. x 12 ft., working under forced draft produced by a Parson blower and regulated by Parson Regulation. Hard coal is used, buckwheat size. The building is heated by exhaust steam and the condensation taken care of by Bundy traps. The Monarch Electric Co., Montreal, were the engineers, and Laurie and Lamb installed the engines and boilers.

CATALOGUES.

OIL VS. COAL—Illustrated catalogues from Tate, Jones & Co., Pittsburg, Pa., being a description of their hardening, and heating furnaces for forging, etc., using oil as fuel.

MANGANESE STEEL CASTINGS — From American Brake Shoe and Foundry Co., 405 Western Bldg., Chicago, giving a list of castings made by them.

MACHINERY—February list of machines in stock from H. W. Petrie, Toronto.

DRILL SOCKETS—Card from the Cleveland Twist Drill Co., Cleveland, O., describing the double tang socket.

MOLDING MACHINE—From Osborn Mfg. Co., Cleveland, describing the Osborn rockover, drop draft molding machine with particulars regarding its use.

PEERLESS REAMERS—From the Cleveland Twist Drill Co., Cleveland, an exceedingly neat folder presenting the claims of the Peerless High Speed Reamers.

SHELBY TUBES—From National Tube Co., Frick Building, Pittsburg, Pa., pamphlet entitled "Shelby Steel Tubes and Their Making," being a complete description of making seamless steel tubing and many phases of the manufacture of steel tubes are illustrated and it is a fine example of valuable technical literature.

BORING MILL—From Gisholt Machine Co., Madison, Wis., descriptive leaflet of their 88" vertical boring mill.

MACHINE TOOLS The National Machinery Co., Tiffin, Ohio, have issued a 197 page catalogue of bolt, nut and rivet machinery, upsetting and forging machines and wire nail machinery, that is an example of the art and taste of the engraver and printer. It is an excellent volume printed on coated paper and contains much valuable information including data on taps, bolts, etc.

AUTOMATIC SCREW CUTTING MACHINERY —92-page catalogue, 9x7, on bond paper, cardboard covers, from National Acme Mfg. Co., Cleveland, Ohio. It gives an interesting and thorough description of the mechanical construction of the National Acme and its possibilities as a producer of duplicate parts.

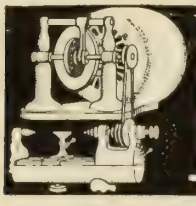
BOOK REVIEWS.

MINING REPORT—A report on the mining and metallurgical industries of Canada has been issued from the Department of Mines, Ottawa, in which is published full statistics of the mineral production, and mining and metallurgical industries of Canada. The volume is illustrated by many photographs, plans and sections of the various mines. Every man who is directly or indirectly concerned with the metal industry of Canada should not fail to have the number in his office or home. The work may be had for $1.00, by addressing Dr. Haanel, Dept. Mines, Ottawa.

ACCURATE TOOL WORK. By C. L. Goodrich and F. A. Stanley. 217 6x9-in. pages, with 221 illustrations. The Hill Publishing Company, New York. Price $2.

The following are some of the subjects taken up in the book: Locating and Boring Holes in Drill Jigs, Economical Jig Work on the Milling Machine, A Precision Drilling and Reaming Machine, A Tool for Laying Out Angles, Measuring Dovetail Slides, Gibs and V's, A Gage for Producing Accurate Tapers. The Microscope in the Manufacturing Plant, A Universal Indicator and Some of its Applications, A New Swedish Combination Gaging System.

This book contains much valuable information for toolmakers. The descriptions of tool room work are clearly written and the illustrations are numerous. Much of the matter is new and the book is worthy of a place in every toolmaker's library.



FISHER MOTORS

Small H.P. Electric Motors for Factory, Office or Home, for operating Dentalor ewellery Lathes, Spice or Coffee Mills, Meat Choppers, Sewing and Washing Machines, or any other machinery. Machinery Markets

MONTREAL.

The market here continues quiet with a few spasmodic increases in isolated cases. However, there are no discouraging tendencies and machine tool dealers are not worrying much over the outlook. Among the larger of the recent tenders that have been called for, appears that of the Intercolonial Railway for ten additional machines for their machine shop. This is probably the largest individual tender called for, for some time Outside of this there is nothing going on to indicate any rapid increase in the machine tool market. Inquires continue to come in in pleasing quantities, the most of them being for single machines of smaller size. The orders eventuating from these inquiries continue fairly steady.

Now that tenders have been called for on the new locomotive plant of the G.T.P. shops in Winnipeg, machine dealers are on the alert in expectation of machinery tenders. These latter will probably not be issued for two or three months yet as the work, necessarily entailed in laying out and deciding on the large amount of tools needed, is very heavy. The tenders of the locomotive plant call for the bare buildings only with exception of heating apparatus. The complete machinery equipment for all of the shops will cost in the neighborhood of $4,000,000 which will add huge impetus to the machine tool trade in all its branches. The C.P.R. are doing not a little machine tool buying.

The wood working machinery trade still continues a little better than the metal, there having been some very nice orders placed here recently, one amounting to over $7,000.

The condition of the machine tool trade for this district is rather hard to determine. A number of houses in the general line report fair increases while other, more specialized firms are not so satisfied. There are a lot of rumors of additions and extensions to plants and factories that have not yet materialized beyond inquiries for quotations. The spring will undoubtedly see the realization of the optimistic views now held by the large majority of dealers here.

In the tool steel trade, orders continue fairly steady, but for comparatively small quantities. Seemingly the manufacturers are still rather shy about stocking up, preferring to buy only when actually needed.

TORONTO.

The increases in railway earnings particularly the G.T.R. are significant of the general trade situation. The volume of traffic is one of the sure barometers of business. The grain trade, due to the great harvest in the west, is practically at an end, so that the traffic increases reflect genuine activity. The gross earnings of the C.P.R. and C.N.R. are reaching new high levels for this season and G.T.R. traffic is closely approximate to 1907.

While there is still room for improvement in the machine tool trade, orders and inquiries have been received that give the machine tool dealers considerable encouragement. There has been inquiries in regard to heavy tools and a few orders for single machines have been placed and many orders for lighter lines. Orders that are being placed for immediate use, but prospects are bright for a good spring demand.

Wood working machinery is brisk at present and many orders have been filled with more in prospect.

The prospect for foundry equipment is bright as many foundries are nearing completion and others are contemplated. The latter include a large foundry to be erected by John Inglis. Several are to be erected in the towns and cities in the vicinity of Toronto and Toronto dealers will no doubt receive the orders for a number of the equipments.

VANCOUVER.

Trade this spring promises to be much better than during the last year. There is activity on all sides, and though the lumber mills have not yet got back to their old time activity, the prospects are better than for twelve months past. At the beginning of last year there were 170,000,000 feet of logs in the water, but on this first of January the amount was only 40,000,000, so that once mills start cutting full time there will be a big demand for logs. Building is even better than last year, when all records were surpassed, railway construction is more general, mining is looking up, orders are being placed for quantities of power machinery, and altogether, the merchants of the coast province anticipate a successful year.

HIGH SPEED TWIST DRILLS

The marvellous results obtained from the use of our Drills are facts, not theories.

Write us for Catalogue and Discount Sheets.

LINCOLN-WILLIAMS TWIST DRILL CO., - - Taunton, Mass., U.S.A.

WE HAVE IT!

A flat and flat twisted high speed drill which RUNS ABSOLUTELY TRUE.

THE REASON—

It has a COMMON STANDARD TAPER SHANK.

Everyone knows that the high speed flat and flat twisted high speed drills are good. There have been two good reasons why they were not used more, viz.: they did not run true and it was necessary to buy expensive special chucks to drive them. These objections have been entirely overcome in the "Collis." The shank is a common standard taper giving a true running drill and no special chucks are required.

We also offer flat and flat twisted drills to fit all makes of track drilling machines.

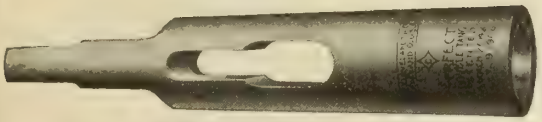
"PERFECT Double-Tang" SOCKETS

(PATENTED)



End
Your Tang Troubles

Reclaim
Your Scrap Heap

They *fit any drill press or lathe spindle* having a regular taper hole.

Three minutes' grinding puts the second tang on your drill it is 25% to 60% thicker than the original tang according to the size of the shank. The Double-Tang Socket does the rest.

Write for "S.S." Circular and Discounts.

The CLEVELAND Twist Drill Co.

BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.

With the Constant Speed Drive Milling Machine you have the Advantage of Ample Power.

The growing use of High Speed Steels requires of milling machines increased power, especially in large machines, and those factors which are necessary to develop power are realized to the fullest extent in this type of machine. The constant speed drive permits the use of counter-shaft and machine pulleys, of large equal diameter, taking a wide belt and running at a high constant speed. This gives large belt contact and high belt velocity, the two requisites of power.

MANUFACTURERS AND MANUFACTURERS' AGENTS.

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate - $2.50 for twenty words or less, 10c a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

DUPLICATING DEVICES.

IF interested in a Duplicating Machine for getting out circular letters, reports, price-lists, etc., or for printing various office forms, write for booklet and samples of work. The "POLYGRAPH" is the newest, latest and best, and sells for a lower price than the others. Is unexcelled by any similar device on the market. F. W. Tenney, Canadian Sales Agent, 123 Bay St., Room 116 Stair Bldg., Toronto, Canada.

FOUNDRY EQUIPMENT.

WANTED—To purchase or work on royalty, articles relating to modern foundry equipment, which will guarantee economy and a saving of labor over present methods. Forward blue prints or patterns. Address Box 63, CANADIAN MACHINERY, Toronto.

GASOLENE ENGINE CASTINGS.

MARINE gasolene engine castings, with blue print and full instructions, etc.; 2½, 4, 6 h.p.; also complete finished outfits at $65 up; catalogue, Krug & Crosby, Hamilton. [10tf]

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

SALESMAN WANTED.

WANTED—Salesman with knowledge of chemical, not drug, trade in Canada. Good position for right man. Jones & Glassco, Montreal. (2)

FOR SALE.

FOR SALE—Half interest in a foundry and machine shop, situated in a beautiful town in Ontario. Is a going concern, employing from ten to fifteen hands the year round, with no opposition. For particulars apply to Box 81, CANADIAN MACHINERY, Toronto. (1)

FOR SALE—A foundry property, situated in Stouffville, Ont., 28 miles from Toronto. Main building two stories high, with foundry and engine room complete. Terms easy. Possession immediately. For full particulars, apply E. B. Fleury, care The Hamilton Facing Mill Co., Limited, Hamilton, Ont. (tf)

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont.

DICTATING to the Dictaphone saves 50 per cent. We will prove it to you if you will send us a post card for full particulars. Toronto Phonograph Co., Limited, Dictaphone Dept., 40 Melinda St., Toronto, Canada. (tf)

HIGH CLASS COLOR WORK.—Commercial stationery, posters. The Hough Lithographing Co., Limited. Office, No 3 Jarvis Street, Toronto. Telephone, Main 1576. Art, good workmanship, business methods. [tf]

ADDING TYPEWRITERS write, add or subtract in one operation. Elliott Fisher, Limited, 129 Bay Street, Toronto.

THE RELIABLE LIGHT will light your store 100% better than gas, electricity or acetylene. 600 candle power light costs 1 cent per hour to operate. Thousands in use. A safe, reliable, pure white light of intense brilliancy. Write for booklet M. The Rice, Knight Mfg. Co., Limited, 40 Lombard Street, Toronto. (1)

NOTICE!!—Users of Pitner Gasoline Lamps are warned against being induced to purchase parts of other makes of lamps to be used on the Pitner. The most vital part of any lamp is its generator and the Pitner Generator has been granted a patent in Canada, the United States and other countries, on the principle of its improved method of generating gasoline vapour. Supplies and parts for the Pitner Lamps can be received by return mail by applying to our representatives or direct to THE PITNER LIGHTING CO., Limited, 36-38 Lombard St., Toronto, Ont. (tf)

BUSINESS CHANCES.

PATENT NOTICE—The owners of Canadian Patents Nos. 95125, 95126, 98650 and 102647, for improved processes for working silica glass and making articles out of fused silica, and for an improved furnace for working silica, are desirous of finding Canadian manufacturers who will take a license under their patents. The processes are being satisfactorily carried out in Great Britain and a considerable number of articles are being made and sold. Applications for licenses may be addressed either to THE THERMAL SYNDICATE, Ltd, of Neptune Bank, Wallsend-on-Tyne, England, or to OWEN N. EVANS, Solicitor of Patents and Expert, Merchants' Bank Building, Montreal, Canada. [4]

When writing advertisers kindly mention having seen the advertisement in this paper.

FOR SALE CHEAP
ARCH POWER PRESS
New; Opening in Bed, 16x22; weighs 4,700
W. H. Banfield & Sons, Toronto
(3)

Factory for Sale
Large factory on Lachine Canal, near the city; about 8,000 square feet of floor and 20,000 square feet of ground, with water power. Close to G. T. R., C. P. R. and boats. Apply to L. E. Godin of McAvoy, Lemieux, Dupre & Godin, 4 St. Lawrence Boulevard, Montreal. 4-09

MACHINERY FOR SALE.

MACHINERY FOR SALE—1 2nd-hand 5½ h.p. vertical boiler and engine, cast iron base supporting same, all in A1 condition; 1 11 h.p. gas engine, 2nd hand, fitted with magneto, and in first-class condition; 25 2 h.p new horizontal gasoline pumping and power engines combined, capacity 25 barrels per hour, elevated 100 ft; also 5 h.p. new gasoline vertical power engines, suitable for boat or launch; 1 24"x24"x7" iron planer, 2nd hand, including chuck. Address, J. D. Anderson, Machinist and Engineer, Box 203, Windsor, Ont. (4)

PERIODICAL DEPT.

WANTED in every town of 2000 or over, a representative to take charge of the circulation of our various publications:—Hardware and Metal, Canadian Grocer, Financial Post, Plumber and Steamfitter, Dry Goods Review, Printer and Publisher, Bookseller and Stationer, Canadian Machinery, and Busy Man's Magazine. Good financial standing and business connection a strong recommendation. A permanent position for the right man. The MacLean Publishing Company, Limited, Toronto.

THE BUSY MAN'S MAGAZINE is the most popular periodical of its kind. Why? Because each issue contains a strong list of original articles of interest to every Canadian. It also reproduces the most timely, instructive and interesting articles appearing in the other magazines and periodicals of the month. The cream of the world's periodical press is too valuable to overlook. BUSY MAN'S is on sale at all news-stands. Better still, send $2 for one year's subscription. Mail it to day. The Busy Man's Magazine, Toronto.

THE MARKET REPORTS make Hardware and Metal a necessity to every hardware merchant, paint and oil dealer, foundry, or other metal manufacturing plant, in Canada. It is mailed every Friday. Subscription price $2.00 per year. Address Hardware and Metal, Montreal Toronto or Winnipeg.

HOW TO WRITE SIGNS, TICKETS AND POSTERS, by Paul N. Hasluck.—Practical handbook giving the general principles of the craft. Contents are: Formation of Letters, Stops and Numerals; Sign Writer's Outfit; Making Sign-Boards and Laying Ground Colors; Simpler Forms of Lettering; Shaded and Fancy Lettering; Painting a Sign Board; Ticket-Writing; Poster Painting; Lettering with Gold, etc. Price 50 cents. MacLean Publishing Co., Technical Book Dept., 10 Front St. E., Toronto.

The Problem Solved

How would you like to have a score or more of expert mechanical engineers at your beck and call—men who could solve all the difficult engineering problems that arise? That's just what you have in our new ***Seven Volume***

CYCLOPEDIA OF

MECHANICAL ENGINEERING

3,276 pages, size 7x10 inches; 2,327 Illustrations, Plates, Diagrams, Tables, Formulas, etc.; bound in half morocco.

In these seven volumes we offer you the expert knowledge of thirty-nine men, every one a leader in the line of work he handles. They offer you the knowledge of recent time-saving inventions, practical information—they straighten out shop kinks, give you the inside information and short-cuts which are generally found only in the private note-books of high-salaried shop bosses.

The Cyclopedia covers the entire field of mechanical engineering—making and use of tools, machine shop work, construction and operation of boilers and engines, pattern making, foundry work, gas producers and gas plants, mechanical drawing and machine design. No branch too big to be treated in detail, no detail too small to be slighted.

These books are as plain to the student as they are helpful to the master workman.

It Costs Nothing to Look

Upon receipt of coupon we will send you a set of this great Cyclopedia, by prepaid express, without deposit or guarantee of any kind. Keep the books five days, examine them carefully, give them every possible test. We want you to be the judge—you are under no obligations.

If you decide the books are not what you want, advise us and we will have them returned at our expense. If you keep the books send us $2.00 within five days and $2.00 a month until you have paid the special price of $18.60. Regular price is $36.00. ***This offer is good until March 1st.***

IMPORTANT SUBJECTS COVERED

Machine Shop Work—Vertical Milling Machine—Motor-driven Shops Shop Lighting—Forging—Electric Welding—Tool Making—Metallurgy—Manufacture of Iron and Steel—High Speed Steel—Flaws in Castings—Electric Lifting Magnets—Magnetic Clutches—Making a Machinist—The Ideal Foreman Pattern Making—Foundry Work—Automatic Coal and Ore Handling Appliances—Machine Parts—Construction of Boilers—Types of Boilers—Boiler Accessories—Steam Pumps Air Compressors—The Steam Engine—The Steam Turbine—Indicators—Valve Gears—Refrigeration—Gas Producers—Gas Engines—Automobiles—Elevators—Sheet Metal Work—Practical Problems in Mensuration—Mechanical Drawing—Drafting Room Organization—Machine Design.

FREE! Order at once and we will include for one year, as a monthly supplement, the

Technical World Magazine

A regular $1.50 monthly, presenting twentieth century scientific facts in plain English. Latest discussion on timely topics in science, invention, discovery, industry, etc. The strongest serial of the season, "WHO OWNS THE EARTH," appears in the February issue. ***Just mail the Coupon.***

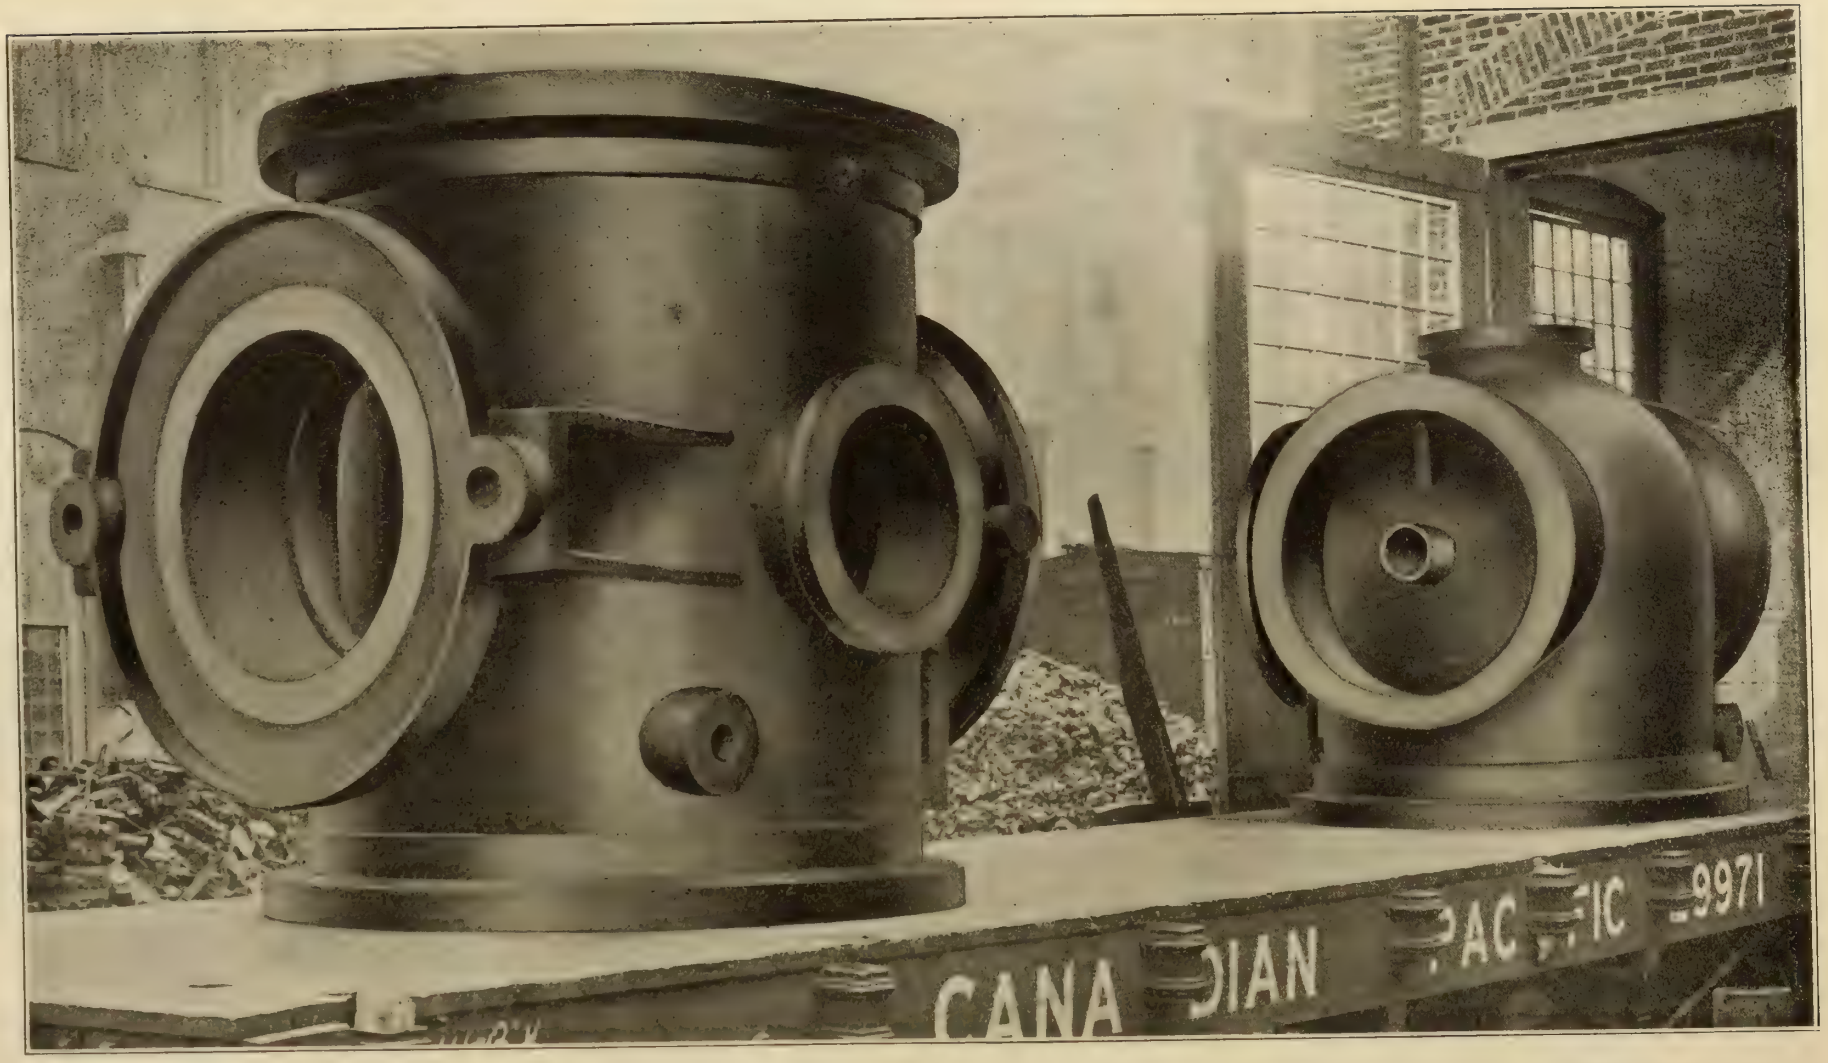
The Only Foundry Supply House in Canada Having Two Warehouses



The above photo shows a fair example of what can be done in Mouldings when our extra quality Ceylon Plumbago, Core Wash, Seacoal and Sand is used exclusively.

These immense castings, weighing respectively 22,810 lbs. and 19,320 lbs., Pump Cylinders, are for Toronto Waterworks.

Our Plumbago Core Wash, Seacoal and Sand were used in the casting of these mountains of iron, the result is shown in this illustration; smooth, clean and perfect castings, satisfactory to moulder, manufacturer and customer.

Order a supply from us to-day and be up-to-date.

Canadian Requirements

Bridge Builders

Steel Plants

Railroads

A personal investigation demonstrates to us that your financial system has upheld you during 1908. Now all leading "CANADIAN PLANTS" are busy and have large prospects for additional orders. Relating especially to those who "melt metals" our desire is to abolish totally the "pit methods of coal or coke," and it is admitted by you that metal lost in foundry pits from Crucibles lessens by a GREAT MARGIN your "manufacturer's profit." Therefore, accept our proposition to instal and demonstrate subject to results and average saving of

50% with "Gas or Oil and Air"

EUREKA! We have found it—and a great many foundrymen can testify thereto if you will ask them about our

Eureka Blacking

for use as a dry sand or wet blacking.

Requires no clay wash, molasses water or sour beer in its preparation, and when dried absolutely will not rub off.

Better than Plumbago or any other core wash for this purpose.

Sold under guarantee—"No pay if not satisfactory." Try it. We take all the chances.

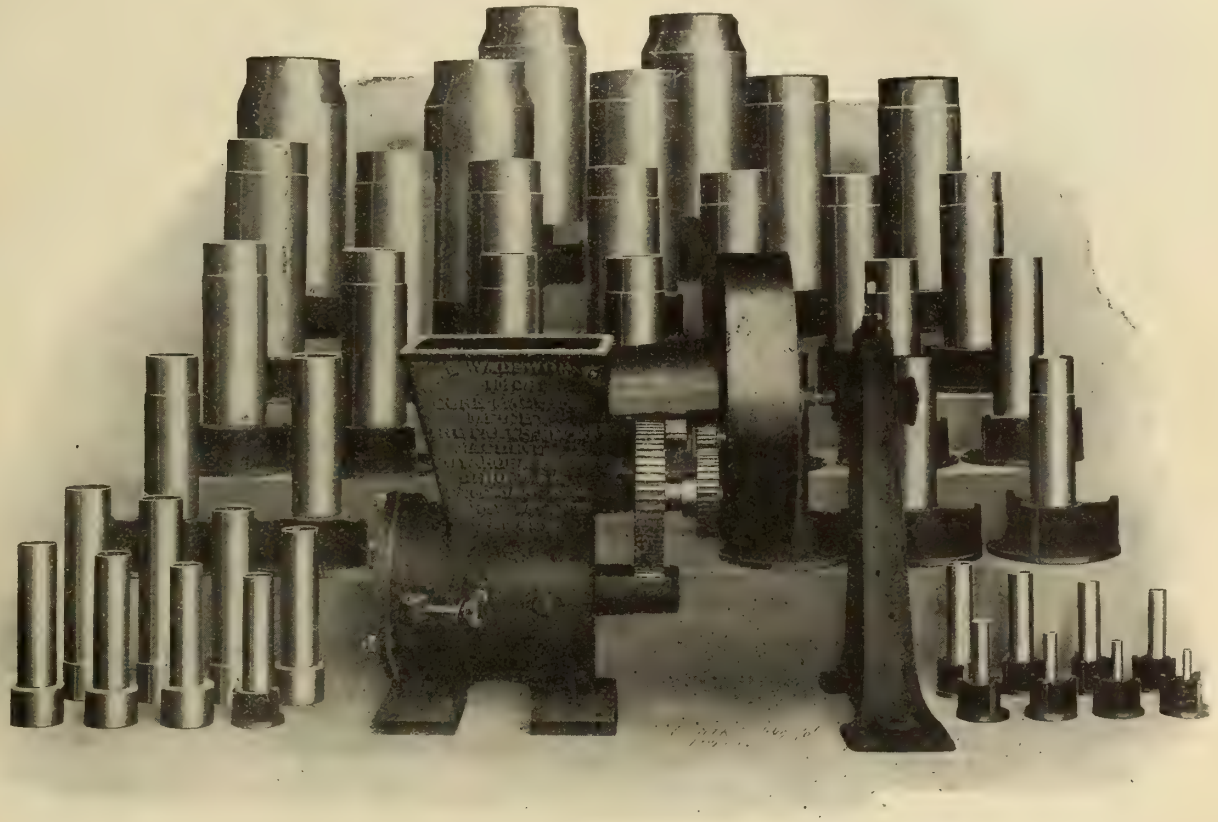
THE WADSWORTH
IMPROVED CORE MACHINES

The only Core Machine manufacturers in the world manufacturing a complete line of Core Making Machinery—5 separate and distinct Core Making Machines, Portable Core Ovens to bake the cores in after making. Core Cutting Off and Coning Machines and manufacturers of a Standard Core Print.



The only Core Machine manufactured that can make a Rodded Core. Any size rod can be used. Hand or Power driven, makes round Cores from ⅜ in. to 7 in. Also irregular shapes. 40 sizes of Cores, all made on one machine.

We are Core Machine Specialists

Compare your time with that of THE WADSWORTH Machine.

One 6″ Core, 24″ long, by hand power in 12 seconds.
One 7″ Core, 5′ 3″ long, by hand power in 80 seconds.

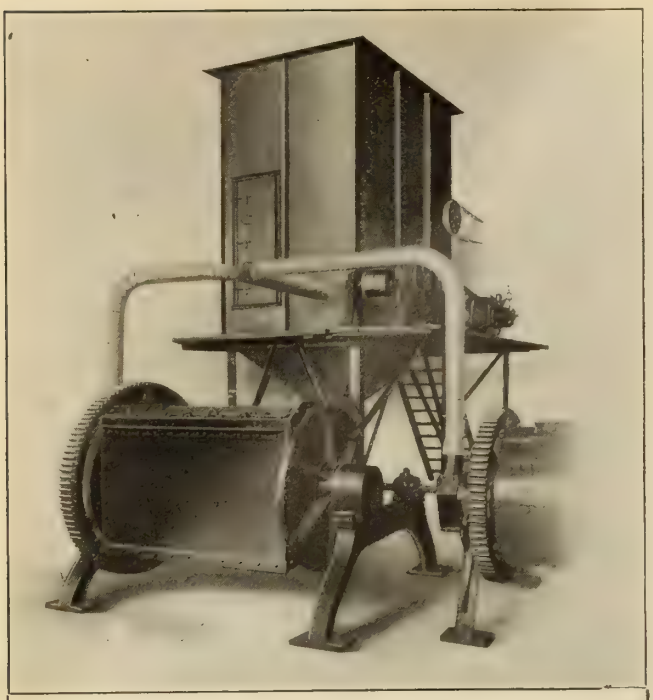
The great strength and accuracy of cores, together with the wide range of shapes possible, make them a valuable foundry investment.

Write for prices and descriptive catalogue.

The FALLS RIVER & MACHINE COMPANY
Cuyahoga Falls, Ohio, U.S.A.

SOLE CANADIAN AGENTS:

THE HAMILTON FACING MILL CO., Ltd., Hamilton, Ont., and Montreal, Que.



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent **Dust Arrester.** Your mill room should be just as free from dust as the best equipped machine shop.

Have you a model plant? Why not be in the lead? You are not using flint to kindle your fires, nor candles to light your plant, nor a two-wheeled cart to deliver your castings. Modern improvements are working to the front every day, and if we want to be abreast with the times, we must follow suit.

Apply this same logic to your foundry cleaning room. The old impression that a scratch shop must be similar to a hurricane on a desert, is fast fading away. Sly Mills will work wonders in your cleaning room. Castings tumbled by the exhaust process will present a clean, polished surface, and give your foundry prestige in that your work will be the best. In order to have clean castings, the dirt must be drawn away from the mills as fast as it is scratched from the castings. This dust pulled by an exhaust fan to our Dust Arrester will settle your cleaning problem. Your mill room will be free from dust, your men can do better work, your castings will be cleaned in one-half the time, and the dirt and grit will not fly about your plant to injure your machinery, and go beyond your plant to become a public nuisance. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

Built in 12 sizes. Holding from 400 to 2,200 pounds of sand. Shipped on ten days' trial.

Danic Sand Blasts are Worthy of Investigation

Some of the Reasons:

(1) Any pressure up to 100 pounds available, giving most satisfactory results in every line of work.
(2) The flow of sand is under perfect control and is free and uniform at all times.
(3) There are no special or costly parts to break or get out of order.
(4) They are economical in cost and efficient in operation.

LET US TELL YOU THE REST.

140 CEDAR STREET, - NEW YORK

FOUNDRYMAN!

The past year marked the introduction of our Foundry Supply Department and although a new line with us, we feel gratified at the large amount of business secured during the year 1908, and we thank you for your very generous patronage and hope to have a continuance of the same during the present year.

In order to give greater attention to our growing Foundry trade and to take the best means of presenting the many advantages of our specialties and productions, we have divided the ground into three territories which will be covered by our representatives as follows:

Eastern Territory - Mr. Albert U. Coté
WesternTerritory - Mr. T. Essery
Montreal Territory - Mr. G. F. Cowper

When in doubt specify Hyde quality.

THE CAMPAIGN OF 1909

When a political campaign document is constructed it must be carefully constructed or else it is liable to be punched full of holes.

The error is discovered too late.

It is much the same way in the foundry business; the error in use of poor materials is only discovered when it is too late for correction.

If you are making machinery castings, you ought not to keep house without **STEVENS' PURE PLUMBAGO.** It is the pure quill. It goes farther in actual use, and produces a clean, smooth face.

If you are using a wet blacking on molds or as a core wash, **STEVENS' CARBON BLACKING** will give you pocket-book satisfaction.

If you want to fill a hole in a casting, otherwise good, **STEVENS' STOPPER** will stop it so you cannot find it; a fine powder mixed with water, easily applied, and costs much less than the many substitutes.

KING KORE KOMPOUND—one part compound to thirty or forty parts of sand, and no odor and no trouble.

I manufacture Foundry Facings, Foundry Supplies, Buffing Compositions and Platers' Supplies. They all bear the stamp of quality.

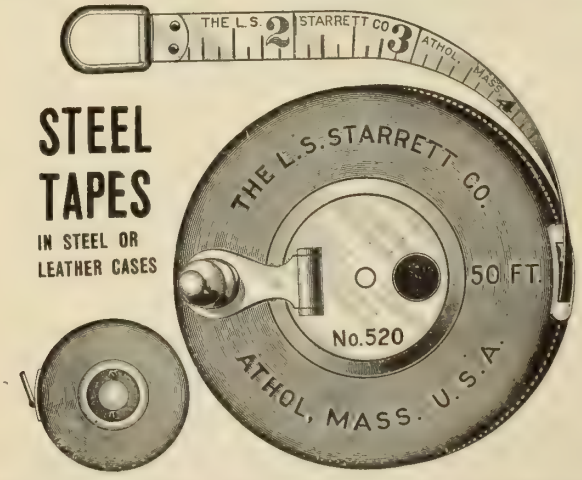
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this :

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usually larger figure.

Graduated in feet, inches and eighths or an inch, or in feet, tenths and hundredths of a foot.

Foundry Work

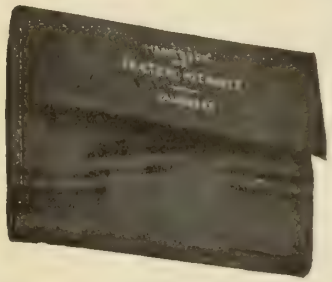
By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions



Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

Published Monthly at **$1.00** per year. **Address Subscription Dept.**

CANADIAN MACHINERY, 10 Front St. E., Toronto

How Do You Figure Labor Cost?

Here is a clock system that automatically figures the labor cost on every operation of every job.

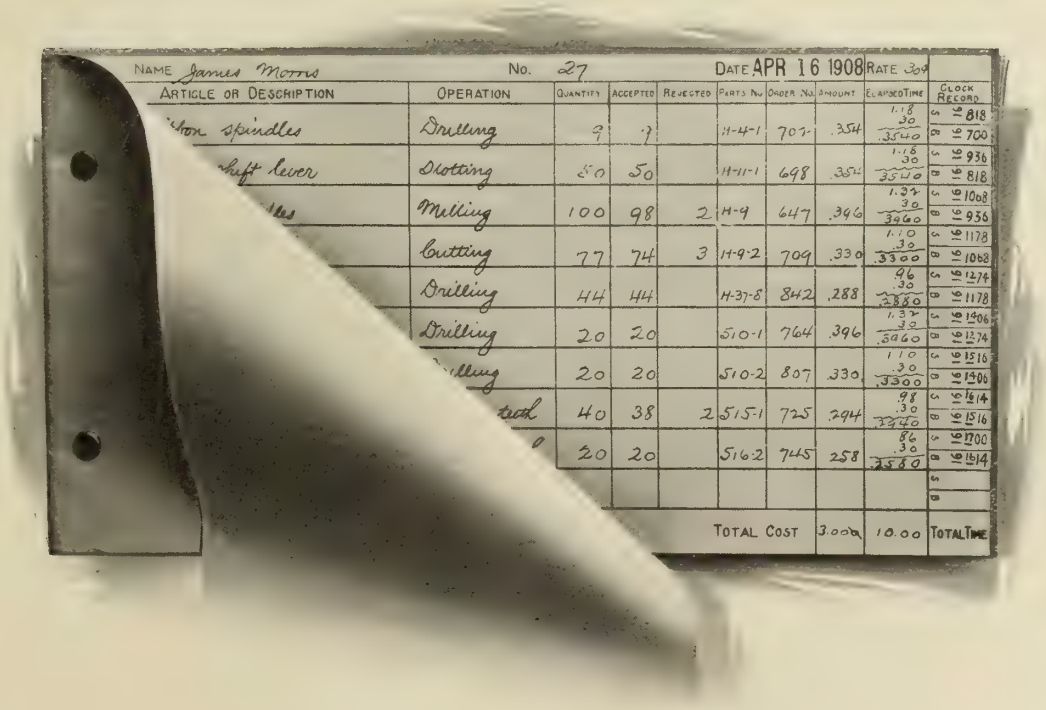
When the operator is given a piece of work a card is given him with the nature of the job written in the proper place. This card he then stamps on the clock and the exact time of commencement is recorded down to the decimal fraction of an hour.

When the work is completed the operator again stamps his card on the clock. The difference between the first stamping and the second indicates the exact amount of elapsed time taken by the operator to perform that particular piece of work.

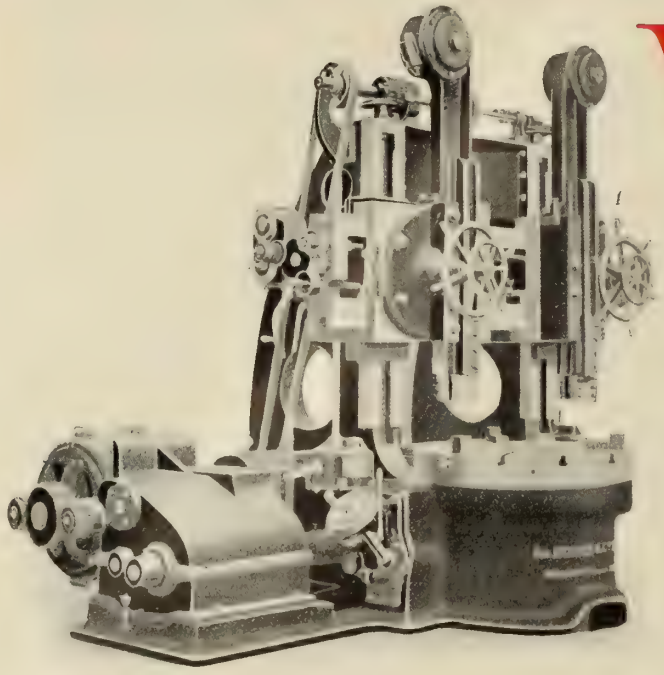
By this simple system the elapsed time on several jobs performed by one operator may be shown on one ticket in card or bound booklet form as shown in the cut below.

The International Time Recording Company of Canada, Limited

67 Yonge St., - - Toronto, Canada



This system is adaptable to every line of manufacturing business. Write us for the "Dey Time Register" Booklet.

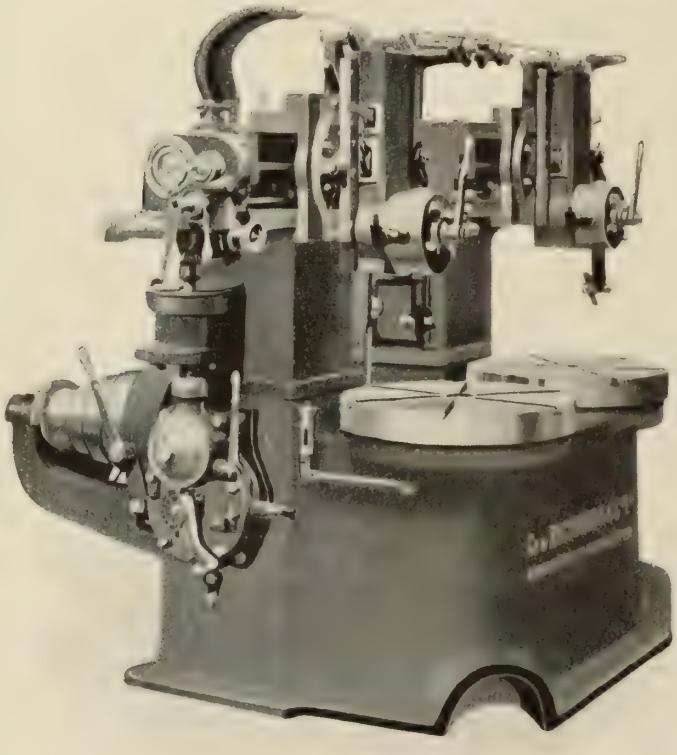


Vertical Boring Mills

Manufactured by George Richards & Co.
Broadheath, Manchester, England

48" Boring and Turning Mill. Special Heavy Type.

In this machine every part is of massive proportions and the mill has been specially designed for Boring and Turning steel tyres or for dealing with other classes of work from which a large amount of stock in hard material has to be removed in one cut. Net weight of machine about 12 tons.
Estimates for machines of this type but of other sizes will be submitted on application.



Duplex Turret Head Boring and Turning Machine

These machines consist of two single turret head boring and turning machines made right and left hand, with the bed cast in one piece. Made in three sizes to admit 14", 26" and 30" respectively. Complete and illustrated catalogues describing these machines will be sent on application.

In addition to the above we carry Horizontal Boring and Turning Mills, Planers, Slotters, Nut and Bolt Making Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Engine Lathes, Turret Lathes, Brass Finisher's Lathes, and special machinery of every description.

We also carry Velos High Speed Steel and Twist Drills and Special Steel for All Purposes, Pneumatic Tools, Chain Hoists, Woodworking Machinery, etc.

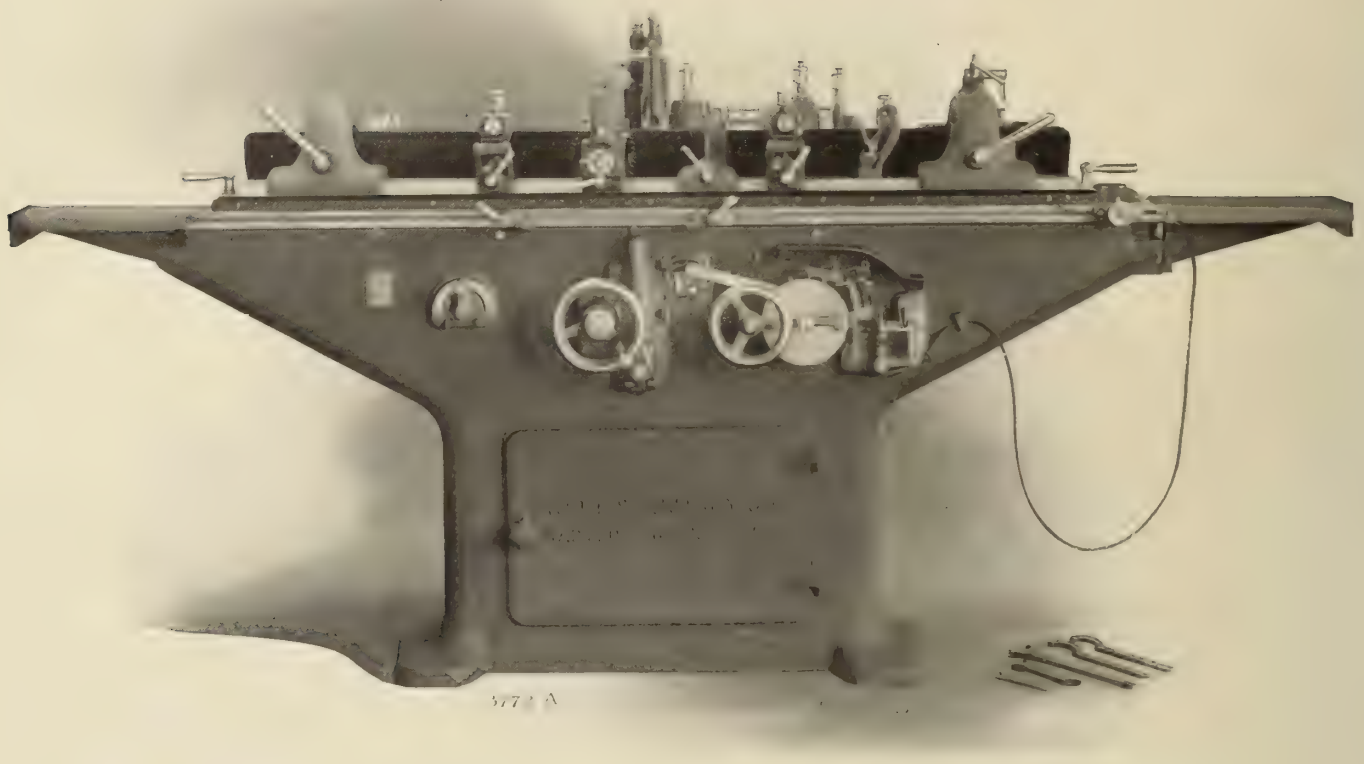
AUTOMATIC GRINDING TO WITHIN .0001 INCH



5 x 48-Inch Grinder with Automatic Sizing Device

Removing the last thousandth, usually the most expensive part of a grinding operation, is done on this machine at practically no cost.

The heavy coarse feed is automatically changed to a fine feed and work is quickly ground with a fine finish to exact size without calipering.

Machine measures faster and more accurately than any man can do it.

Wear of emery wheel has no effect whatever, and wheel is worn out on the work—not by truing it up.

Write for illustrated circulars with complete description.

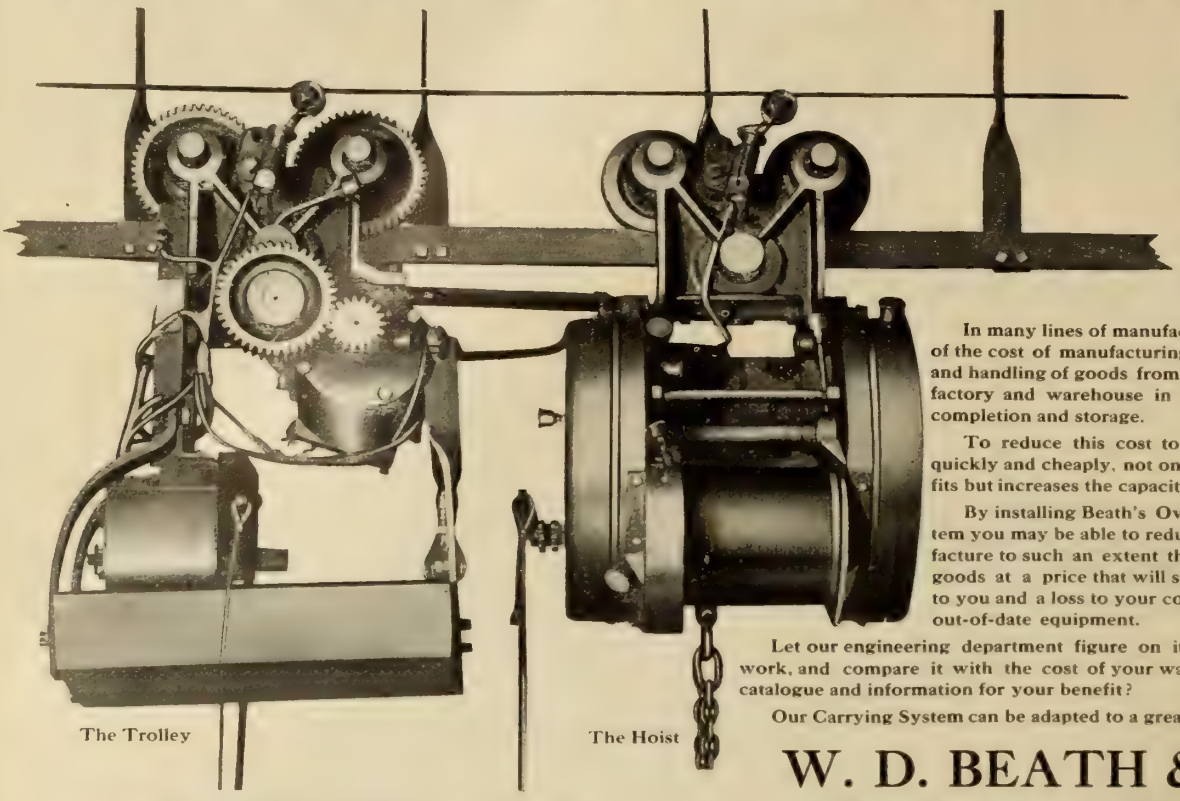
BEATH'S OVERHEAD CARRYING SYSTEMS



Beath's Electric Hoist and Trolley

Overhead Tracks, Electric and Hand Hoists and Trolleys

For Handling Raw Material and Finished Product

In many lines of manufacture fully 50 per cent. of the cost of manufacturing is in the transporting and handling of goods from point to point in the factory and warehouse in the various stages of completion and storage.

To reduce this cost to a minimum, to do it quickly and cheaply, not only increases your profits but increases the capacity of your plant.

By installing Beath's Overhead Carrying System you may be able to reduce the cost of manufacture to such an extent that you can sell your goods at a price that will still mean a good profit to you and a loss to your competitor who is using out-of-date equipment.

Let our engineering department figure on its way of doing your work, and compare it with the cost of your way. Shall we send our catalogue and information for your benefit?

Our Carrying System can be adapted to a great variety of work.

W. D. BEATH & SON

193-5 Terauley St., TORONTO

Derrer Oval Taper Drill Sockets

Give An Absolute Perfect Positive Drive

THE accompanying illustration shows the appearance of the hole and the proportion of the oval.

We have adopted a standard on all of our tapers of three-eighths of an inch to one foot, and also a uniform standard of oval.

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others :

- From one-third to one-half shorter.
- No tangs to twist off.
- No set screws or keys.
- Positively no slipping or binding.
- All our work interchangeable.
- Absolutely true running drills.
- Drill breakage reduced to a minimum.
- Drill accounts reduced 25 to 50 per cent.
- 25 to 50 per cent. more work through your drill presses.
- Chuck and socket account reduced 75 to 90 per cent.
- A drill chuck or socket that is practically indestructible.
- Gives an absolute perfect positive drive.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

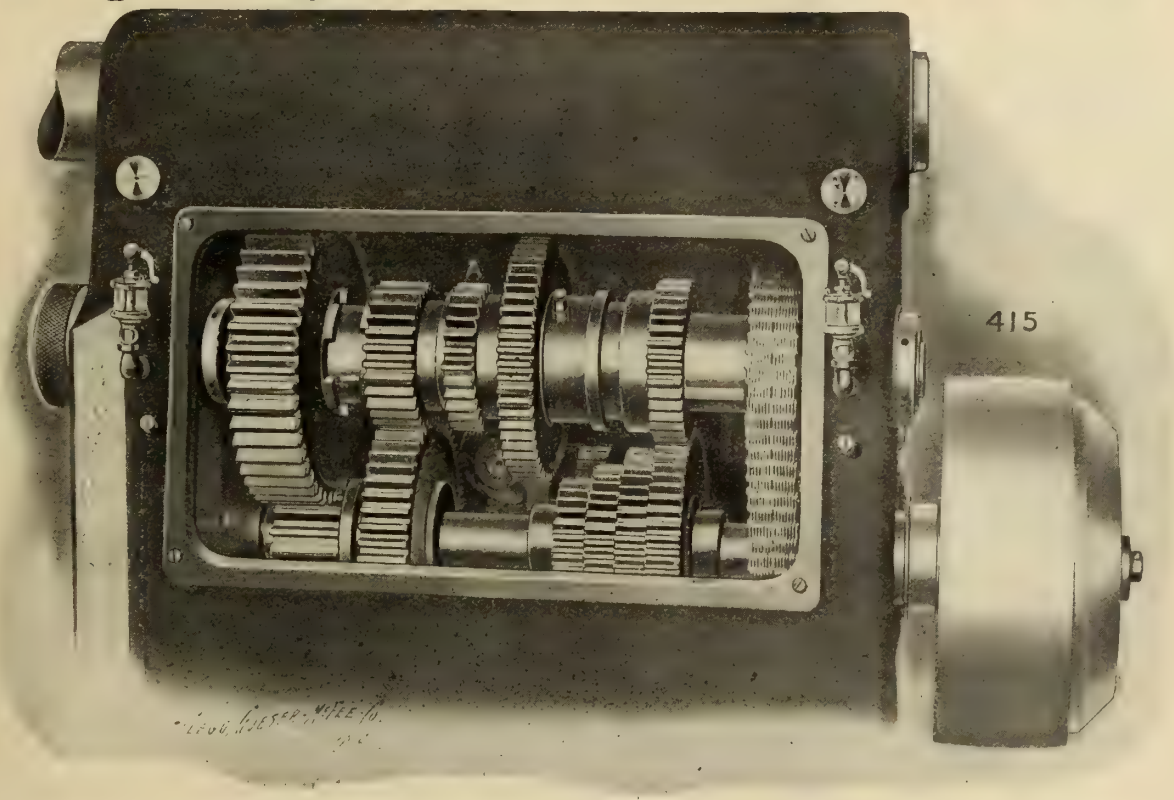
Simplicity, Handiness, Efficiency



CINCINNATI HIGH POWER MILLERS

Horizontal and Vertical

have the following exclusive features which make for greater production :

ALL GEARS OF STEEL with teeth of standard length, 20° pressure angle.
NO GEARS ever in mesh except those needed for the speed being used.
THE DRIVE is always through the main gear, keyed to the front end of the spindle.
THE TUMBLER frame is supported on a slide inside the column ; it is securely clamped, automatically, by the operation of speed changing.
THE MAIN SHAFTS are never subjected to combined torsional and bending strains.
THE DRIVING PULLEY runs on an independent bracket which relieves the main shaft of belt pull.
THE SPEED INDEX is truly direct-reading, simplest possible form.
THE TREADLE makes speed-changing quick and easy.

One Gisholt Equals Four Engine Lathes

Do you thoroughly understand the reasons for the great capacity of the Gisholt Lathe?

Multiple cutters so arranged that 2, 3, 4, and oftentimes as many as six cutters may be brought into operation at the same time.

Cutter holders so fixed that each set stands ready to do its work as the several operations progress.

No waiting to change tools.
No guessing with scale or caliper.
Parts are duplicated exactly—quickly.

These are some of the reasons why One Gisholt Equals Four Engine Lathes on certain classes of work. In some instances we have materially exceeded even this mark.

What the Gisholt will do for you in your shop depends on the nature of your work. We stand ready to put our time against yours to tell you what the Gisholt will do for YOU. Most likely we can double your output on this class of work—probably we can treble it—possibly we can't beat it. In any event we are willing to advise you definitely what the Gisholt will do.

Automatic Board Lift Drop Hammers
Hot Trimming Presses with Side Shear

The endurance and effectiveness of Amtomatic Drops depend in no small degree on a proper ratio between the weight of the base and the weight of the hammer. The additional cost with all parts made of proper proportions is more than compensated for by the larger quantity and better quality of the finished product, and by the comparative freedom from breakdowns obtained from their use;

The hammers are made of steel forgings. The bases are cast in a single piece

Line of Eleven Patterns with Hammers from 200 lbs. to 3,000 lbs. Trimming Presses of Various Designs.

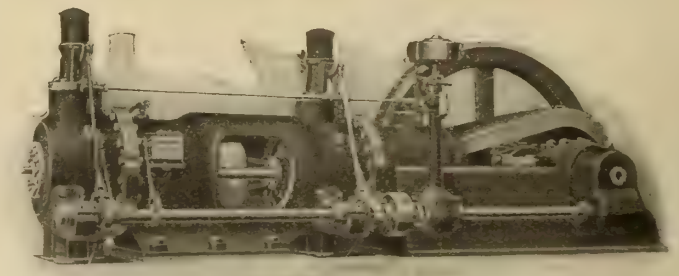
PROVED BY RESULTS

You will only believe any claims we make upon the indisputable evidence of results accomplished. There is an abundance of such evidence to show that

Warren Gas Power Plants

are not only every bit as reliable as steam, but considerably cheaper. Within four hours' travel of Toronto there are Warren Engines to the aggregate extent of 10,000 h.p. in operation to-day, giving their owners the utmost satisfaction. You owe yourself an investigation into the merits of Warren Engines. The more thoroughly you investigate the more thoroughly you will be convinced that you can save money by installing a Warren Engine. : : : : : : :

Write for Full Particulars



Cut shows the Warren Tandem Type Machine. Sizes to 1000 h.p. Engines of this type operating within a day's travel of Toronto have established world's records in fuel economy.

The Canadian Appraisal Co.,
Montreal, Que.

Dear Sirs:-

We feel that in justice to you we should advise you that your appraisal was of invaluable assistance to us in adjusting the loss through the fire that took place on Dec. 24th. last and entirely destroyed our factory and plant.

Your figures were accepted without hesitation by the insurance adjustors and we were complimented upon the way in which we were able to prove the values of our buildings and machinery.

We could hardly write you a letter expressing too strongly our views on the matter of the necessity of an appraisal, and our recent experience has convinced us that we should in the future always have an up-to-date independent valuation of all our fixed assets, and we consider the fee paid you was one of the wisest outlays we ever made.

This letter is unsolicited and we would be glad to have you use us as a reference.

Yours truly,
THE SANDERSON-HAROLD CO. LTD
J. Harold
Managing Director.

The above letter is proof of the value of our appraisals.

How Do You Figure Labor Cost?

Here is a clock system that automatically figures the labor cost on every operation of every job.

When the operator is given a piece of work a card is given him with the nature of the job written in the proper place. This card he then stamps on the clock and the exact time of commencement is recorded down to the decimal fraction of an hour.

When the work is completed the operator again stamps his card on the clock. The difference between the first stamping and the second indicates the exact amount of elapsed time taken by the operator to perform that particular piece of work.

By this simple system the elapsed time on several jobs performed by one operator may be shown on one ticket in card or bound booklet form as shown in the cut below.

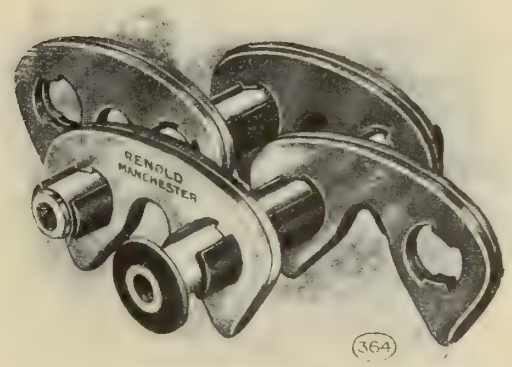
Renold Chains

ABSOLUTELY RELIABLE



THE RENOLD PATENT SILENT CHAIN

Note the following points : The wear comes on tempered and lubricated hard steel surfaces, while the bearing surface is the maximum it is possible to give in chain construction. The pin revolves inside the bushings, thus wearing evenly. The mild steel links are completely protected from wear. For the above reasons and their superior workmanship and material Renold Chains are giving a longer life than any other.

Hans Renold, Limited, Manchester, England, supplied the first bicycle chain ever made about thirty years ago and to-day are supplying the highest grade manufacturers in all parts of the world. Later they took up the manufacture of motor car chains and now supply some fifty different makers of cars. Some ten years ago they were the first to take up the manufacture of **Silent Chains** and it is only since they have made such a brilliant success of this drive that other firms have imitated them and got round their patents by various devices, some of these constructions now on the market having been tried and discarded as unsatisfactory years ago by Renold's. When you buy a Renold High Speed Silent Chain you are getting the benefit of their thirty years' experience in chain driving. You are dealing with the largest manufacturer in the world, and, to show the success of this drive, the new addition last year to their old works is 200 yards long by a hundred yards wide, given up solely to the manufacture of driving chains. Also skilled labor and high grade steel are cheaper in England than in the United States and their goods come in under the preferential tariff.

The New Grand Trunk Locomotive Shops at Stratford

General Description, Showing Arrangements of Shops and Their Construction, Including Structural Steel and Foundations on Concrete Piles.

The G. T. R. have recently completed shops at Stratford, Ont., which, though not the largest, are among the finest in Canada. The new plant consists of a machine and erecting shop 616 ft. x 175 ft., a boiler shop 135 ft. x 154 ft., and a power house 90 ft. x 108 ft. The power house and the machine and erecting shop are connected by a pipe tunnel made of reinforced concrete. In addition to the buildings just described, there is contemplated in the future the erecting of a foundry, 110 ft. x 140 ft. and a pattern shop 50 ft. x 120 ft. It is also proposed to run a yard crane from the foundry to the machine and erecting shop. All these various buildings, etc., are shown in plan, which also shows the older buildings, consisting of the tender shop completed in 1904, the offices, the storehouse, blacksmith shop, carpenter shop, brass foundry, plate shed, tube and pipe shop, etc. It also shows position of turntables.

ROBERT PATTERSON, MASTER MECHANIC, STRATFORD SHOPS.

The wall are reinforced concrete of a strong and massive design. The structural steel was installed by the Canadian Bridge Company, of Walkerville, Ont., and the general construction was accomplished by Mr. B. V. Hole, of London, Ont.

The structural steel work consists of plate, angle and channel columns supporting roof trusses of the Warren type and plate crane girders. The steel columns are designed to carry the maximum roof, wall and crane loads with a fibre stress of 16,000 lbs. per square inch less the ordinary deductions for designing long columns. When crane thrusts and wind stresses are considered in addition, the total stresses are allowed to run up to 20,000 lbs. per sq. inch. In designing crane runway girders, careful consideration was given to the effect of the horizontal and vertical shear on the top flange rivets, due to heavy wheel concentration. The balcony in the light machine bay is designed to carry a live load of 350 lbs. per square foot.

The question of foundations required some study. The present shop plant is

W. D. ROBB
Supt. of Motive Power.

EARL H. FITZHUGH.
Third Vice-President.

CHARLES M. HAYES
General Manager.

built upon a fill varying in depth from 10 to 15 feet below final floor level. After some consideration and comparison of various designs, it was decided to use concrete piles for the seven bents of the boiler shop and the west eight bents of the machine and erecting shop. These piles were driven in groups of from three to six each under the building columns. They were finished off about three feet below the floor level, at which point a reinforced concrete cap was built up to an elevation 2 feet below floor line, which elevation was adopted for the base of steel columns. The wall foundations were carried between these concrete pile footings and were reinforced so as to act as concrete beams. The concrete piles ordinarily carry a load of from 15 to 20 tons each; the maximum load with all cranes fully loaded and full snow load on the roof being between 35 and 40 tons on each pile. A test was made of one of these foundations and the same was found to be satisfactory under the above loads. The longest pile driven in was 20 feet, others varied in length from 12 feet. The remainder of the foundations were designed with spread footings on basis of a soil pressure of 5,000 lbs. per square foot. These footings are carried down to the natural ground level and the wall footings are carried between them as concrete beams, as previously mentioned. In the first eight bents of the erecting shop, the engine pits are also supported on concrete piles, eight concrete piles being driven under each engine pit, each figured to carry a maximum load of 35 tons.

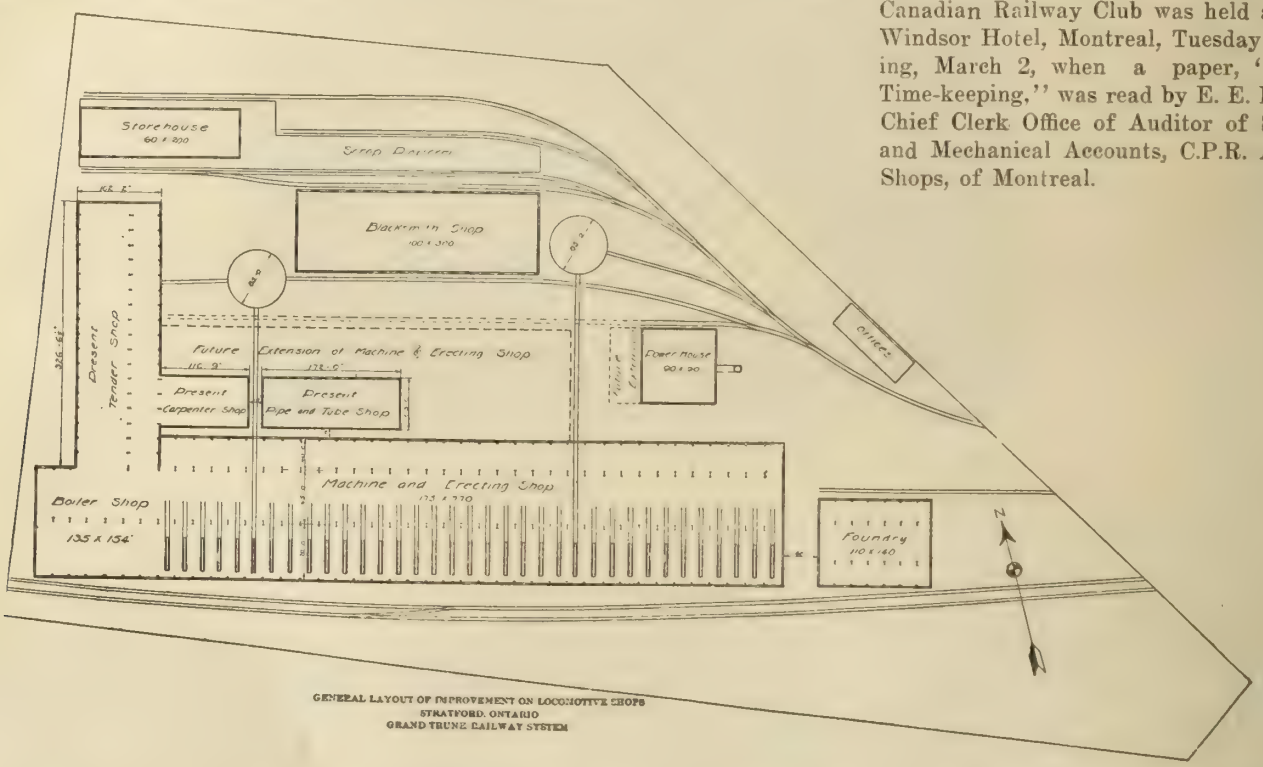
The men at the head of the G.T.R. who were responsible for the successful carrying out of the work were General Manager Charles M. Hays; Third Vice-President E. H. Fitzhugh, the head of the Construction, Motive Power and Transportation Departments of the G.T.R.; W. D. Robb, Superintendent of Motive Power, and Robert Patterson, Master Mechanic at Stratford, under whose personal supervision the work was carried on.

The Master Mechanic.

Robert Patterson, of the Stratford locomotive shops, received his primary education at the Model School, Toronto. He entered railway service in 1874 with the G.T.R. in the motive power department at Montreal, where he served three years of his apprenticeship. The remainder was served in the Stratford shops. He worked as a journeyman machinist at the Baldwin Locomotive Works, Philadelphia, from July, 1881. to April, 1882, when he returned to Stratford as foreman of the machine shop. In the same year he was appointed general foreman of the Midland Railway at Port Hope, and was locomotive foreman of the G.T.R. at Montreal from 1883 to 1887.

He was transferred from Montreal to Toronto as locomotive foreman, and made general foreman of the shops at Toronto in 1888, when the G.T.R. took over the Northern and Northwestern Railway. He was acting assistant master mechanic at Gorham from October to December, 1896.

In 1897 he was made general foreman of the shops as Port Huron, Mich., and the same year master mechanic of the G.T.R. lines west of the St. Clair. In February, 1889, he was transferred to Stratford as master mechanic of the shops, and now holds that position. It is an interesting feature that Thomas Patterson, father of Robert Patterson, was general foreman of the Stratford shops from May, 1871, to January, 1872, and July, 1877, to August, 1888.



GENERAL LAYOUT OF IMPROVEMENT ON LOCOMOTIVE SHOPS
STRATFORD, ONTARIO
GRAND TRUNK RAILWAY SYSTEM

CENTRAL RAILWAY & ENGINEERING CLUB.

The regular monthly meeting of the Central Railway & Engineering Club was held at the Rossin House, Toronto, Tuesday, March 16th. A paper was read on Car Heating, by C. S. Parker, representative of the Parker Car Heating Co., London.

CANADIAN RAILWAY CLUB.

The regular monthly meeting of the Canadian Railway Club was held at the Windsor Hotel, Montreal, Tuesday evening, March 2, when a paper, "Shop Time-keeping," was read by E. E. Lloyd Chief Clerk Office of Auditor of Stores and Mechanical Accounts, C.P.R. Angus Shops, of Montreal.

The feature of the April meeting will be a paper on Snow Fighting, by A. W. Wheatley and T. McHattie. Mr Wheatley is manager of the Montreal Locomotive Co., and Mr. McHattie is master mechanic G.T.R.

The annual meeting will be held on Tuesday evening, May 11th, at the Windsor Hotel.

T. McHattie, formerly master mechanic of the Eastern division of the G.T.R. Montreal, has been appointed superintendent of motive power and car department on the Central Vermont Railroad, with headquarters at St. Albans, Vt.

Features and Equipment of the Machine Department

Machines Arranged in Groups to Facilitate the Handling of Work—Heavy Machines with Individual Motor Drive; Lighter Machines in Group Drive.

The machine, erecting and boiler shops are in one building. It is a self-supported, steel structure, reinforced with concrete walls. The total length is 770 ft. and the total width is 175 feet. There is no division between the machine and erecting shop and the boiler shop, the same runways being carried through both shops. The erecting and machine shop is 616 ft. in length, the erecting shop occupying the south aisle and the machine shop the centre and north aisles. The centre aisle has the service of two 10-ton cranes and the north aisle under the balcony is for belt-driven tools. Above the latter is a gallery used for heating fans, air brake department, brass, bolt work and other light machine work. All heavy machines in the centre bay of machine shop are driven with individual motors, but machines under and above the balcony are divided into nine groups. Each one can be run separately or a number can be coupled up and driven together. As the work of this shop is all specialized, each group contains its own particular machines for its special work, also the necessary fitting equipment.

Alternate columns of the heavy machine bay are provided with compressed air and electrical connections. Air is also provided along the north wall of the building and under the balcony. On every fourth column of the two middle rows of columns, water service connections are provided on the main floor and balcony.

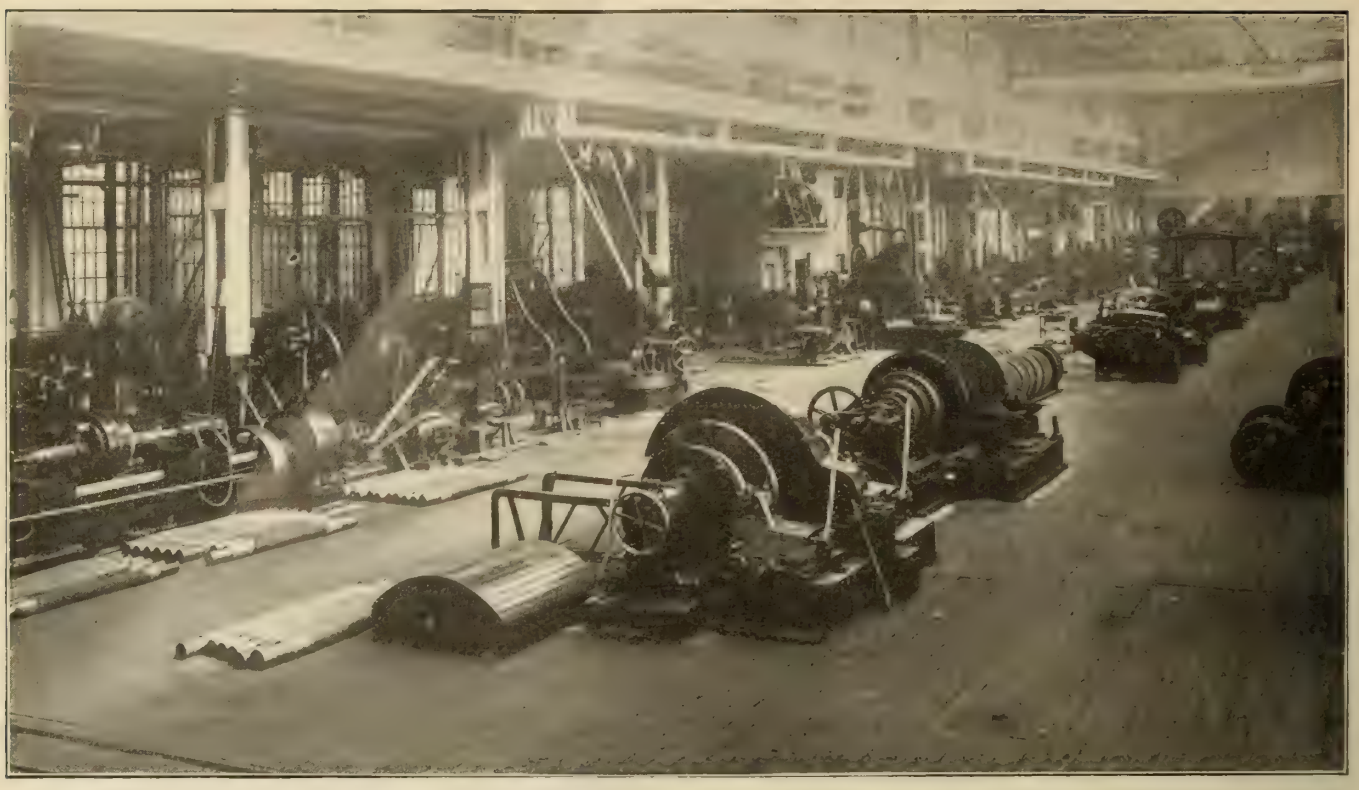
The Machine Department, Looking East. In the Foreground is Group No. 1 Consisting of a Boring Mill of the Barret Machine Tool Co., Meadville, Pa., the Cylinder Shaper, Made by Morton Mfg. Co., Muskegon Heights, and the Radial Drill Made by John Bertram & Sons.

Grouping of Machines.

To facilitate the handling of work the machines are arranged in eighteen different groups. The ordering of the machine tools and the arranging of them was under the supervision of Robert Patterson, master mechanic at Stratford. Some of the groups contain individual motor-driven machines, grouped to take care of different classes of work. If one special group has more work than ordinarily, there are groups for general work.

The machine tools have been arranged as follows: Group (1) for cylinders, (2) crossheads, pistons, valves, guide bars, etc., (3) motion work, (4) driving axles and wheels, (5) tire work, (6) axle boxes, (7, 8, 10, 11 and 12) general work, (9) truck wheels and axles, (13) frame and rod work, (14) main and siderod work, (15) brass work in gallery, (16) air brake work, (17) bolt work, and (18) tool work, small tools, repairs to tools, gears, cams, etc.

A chargeman is responsible for the



A View of the Machine Department Looking East. The Axle Box Department is Under the Gallery. An Axle Lathe is in the Foreground, also Truck Wheel Lathes. The Tracks in the Foreground at the right of the illustration Mark the Center of the Shop, East and West.

View in the Center of the Shop Looking West, Showing Some Large Tools Supplied by the London Machine Tool Co., Hamilton; and John Bertram & Son, Dundas. The Foreman's Office is Shown and the Heating Fans Situated in the Gallery Above the Men's Washrooms.

work in each group. This man is an expert machinist, well acquainted with the work done in his group. He exercises a general supervision, keeps the men fed with work and accomplishes a great deal himself.

One man is responsible for keeping the groups supplied with work and for the removal of it when it is completed. When the supply of tires at the boring mills is low, he brings in a new supply and moves the finished tires to the centre of the shop where the tires are expanded unto the wheels.

The general purpose machines are grouped in the centre of the shop under the gallery. All belt-driven machines have been placed so as to have uniform drives. The countershafts down stairs and in the balcony are parallel to the main line. All down belts are at a good angle.

placing a new tire on the machine and removing it when it is finished.

To show the facility with which the castings to be machined are handled, the cylinders may be taken as an example. The rough castings are brought in on a supply track and are moved by the ten-ton crane to the marking off table in front of the boring machine. They are then set up on the Barret cylinder-boring machine shown in the illustration, then on the Morton cylinder shaper and boring machine, and, finally, to the Bertram radial drill, where the cylinders are finished. These machines constitute group 1. Other groups are similarly arranged so that a casting is machined with the least possible handling.

Barret Boring Machine.

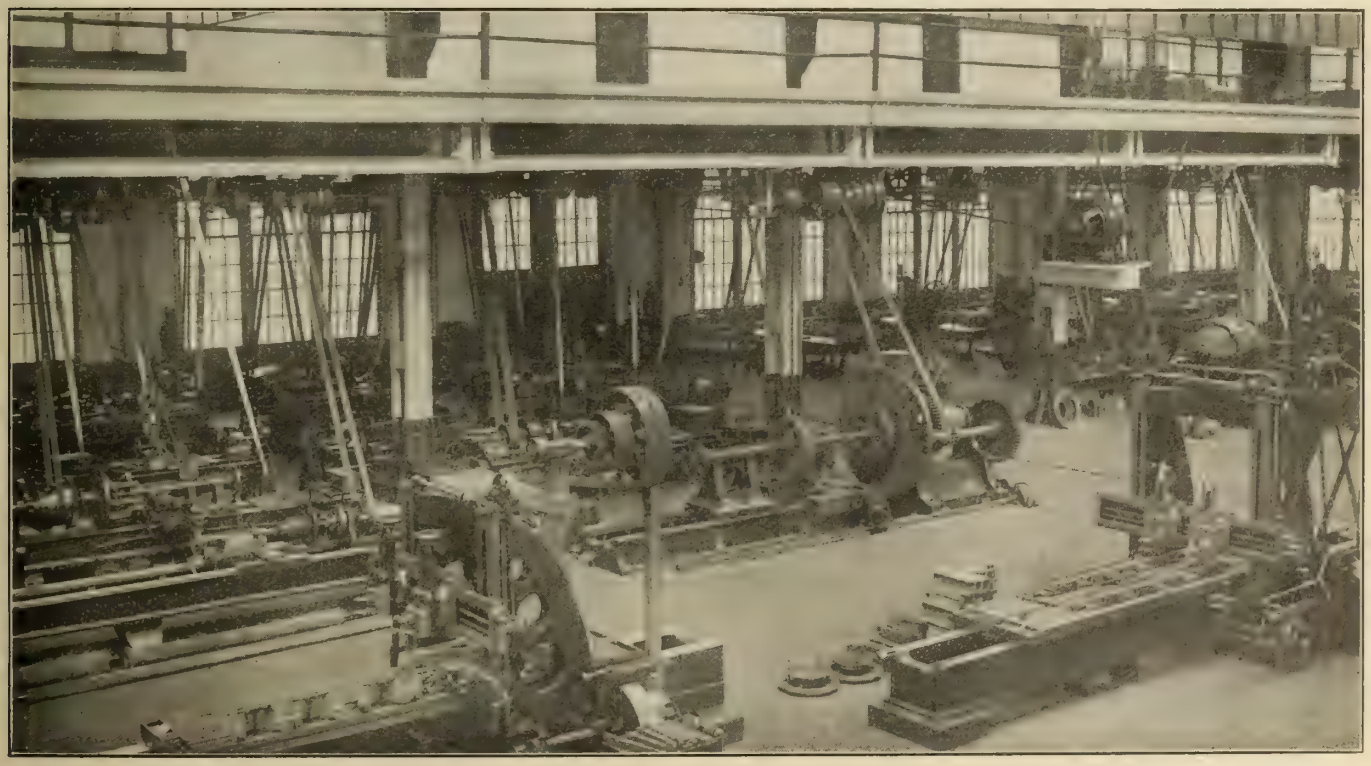
With this machine the cylinders require only one setting and piston valve

using a table this machine may be used for milling axle boxes, slab milling and general milling.

Three motors operate the machine. One raises and lowers the head and gives transverse motion. A 15-horse power motor drives the ram for cutting. A small air compressor, motor-driven, is attached for balancing the head. This air compressor works automatically with automatic contact.

John Bertram Equipment.

Among the large motor-driven machines supplied by John Bertram & Sons, Dundas, are No. 8 bending rolls, 72 in. radial drilling machine, double back geared engine lathe, slotter, planer, 24 in. double head shaper, Pond coach wheel lathe, driving wheel lathe, punch, etc.



A View of the North-East Corner of the Machine Department Looking Under the Gallery where the Connecting Rods are Machined and Fitted, Being Made Ready for the Erecting Department.

All heavy tools are in the centre bay or aisle, so that work can be handled by the ten-ton crane. The heavy machines are all on concrete foundations. A feature of the motor drive is that they are low speed, 335 R.P.M., with the main shaft running at 180 R.P.M. in the case of the six-group drives. Jib cranes are arranged at points along the shop for the handling of material independent of the electric crane. For instance, there is a jib crane serving the boring mills of Bertram & Sons and the London Machine Tool Co. These boring mills are for tires and the jib crane is used for

and cylinder may be bored at one setting. A Lincoln Motor Works variable speed motor is connected by a Morse chain. The speed of this motor may be varied from 300 to 1,200 R.P.M. by moving the armature across the poles.

Morton Cylinder Shaper.

This is a combination machine for boring the holes in the steam chest, milling the ports and planing the face of the steam chest. This is all done without removing the cylinder from the chucks. It is very accurate and can be used for drilling all small holes. By

Tools From London Machine Tool Co.

The London Machine Tool Co., Hamilton, have supplied a number of large motor-driven machines, including a slab miller, 8 ft. boring mill, axle lathe, journal lathe, tire lathe, etc.

The London Machine Tool Co.'s 90-inch wheel lathe was designed for heavy work and gives good satisfaction. The machine is a massive one and weighs 102,000 lbs. It is driven by a 60 h.p. variable speed motor, and for moving the left-hand head it is equipped with a 5 h.p. motor. A full description of this

wheel lathe with tests appears on pages 43 and 44 of the May, 1908, issue of Canadian Machinery.

Other Machine Equipment.

The rest of the equipment includes a T. C. Dill slotter, several Smith & Coventry machines, Dunn Hattersby truck wheel lathe, Hilles & Jones plate planer, Wm. Sellers & Co. grinding machines, Brown & Sharpe's milling machine, Becker Brainard milling machine, two 36 in. Gisholt boring mills, one 42 in. Gisholt boring mill, etc. A 500-ton press for pressing wheels on axles forms part of the equipment.

Expanding Tires.

A system is used for expanding tires to put them on the wheels which does away with the use of coal and the consequent gathering of ashes, etc. Rings slightly larger than the tires are put over them and are connected to gasoline tanks by rubber hose.

The gasoline is contained in tanks and is fed to the rings in which are numerous small holes, under pressure. The holes are drilled in the iron pipe so that the flame plays on the steel tire. This system is found to work well. When a tire is expanded sufficiently, the iron rings are put away and the job is proceeded with, without having to clean up the remains of a fire.

Chain Drive.

One of the features of the machine department is the application of chain drive to many of the machine tools, the Morse system having been installed.

Among the machines thus connected are planers, 42 in. truck wheel lathe, slab milling machine, six spindle stay bolt cutter, two spindle drill, sheet iron bending rolls, etc.

A ten horse power motor is connected to a London Machine Tool Company's slab milling machine by chain. The motor operates at 565 to 1130 R.P.M., milling machine at 239 to 478 P.P.M., chain, 9 in. pitch 3 in. wide operating over 19 and 45 teeth on 24⅜ inch centers, maximum feet per minute, 1610.

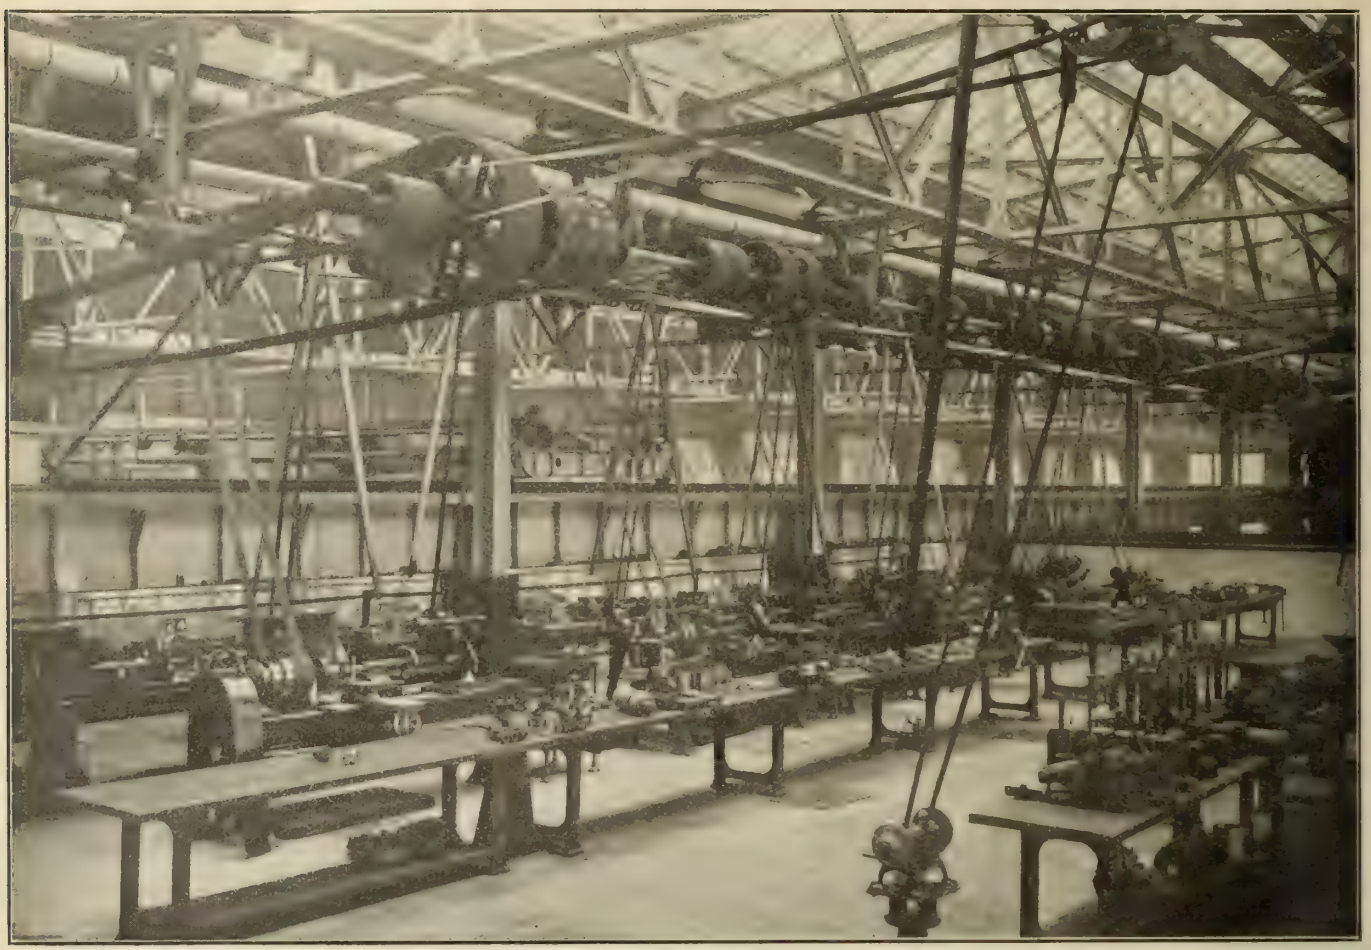
A 3½ H.P. motor drives a Bertram sheet iron bending rolls through chain, motor operating at 975 P.P.M., rolls at 160 R.P.M., chain 9 inch pitch, 1 inch wide operating over 15 and 91 teeth on 33 inch centers, 1100 feet per minute.

Ten countershafts are thus driven through Morse chain varying in lineal velocity from 952 to 2280 feet per minute, the width varying with the horse power of the motor and the work to be accomplished.

Chain drive is a silent drive. Though the first cost is found to be dearer than other forms of connecting motors to the line shafts or individual machines, the upkeep is very low and the system is economical.

The Gallery.

The gallery contains the brass department, air brake department, tool room, bolt department and template room. The Sturtevant heating fans and coils are also situated in the gallery.



The Brass Department in the Gallery, Showing the Arrangement of Machinery and Countershafts for Group Drive. This Arrangement is Carried out in all the other Group Drives.

A view of the brass room is here shown. There is a stores department connected with the brass department, and all finished material is given out by the man in charge, on receiving an order signed by the foreman of a department. The illustration serves to show the arrangement of the group-driven machinery.

The bolt department contains bolt threaders, lathes, turrets, and a bolt stores, where finished and unfinished bolts are kept. These are also given out on receipt of an order from a foreman.

The template stores contain the tem-

plates for the many jobs requiring them. The templates are in charge of an expert who designs new ones as required. The templates are given out by check and the man receiving one is responsible for it until it is returned.

In the air brake department the apparatus is carefully tested and receives a more severe test than when in actual service. A complete train equipment for thirty-five cars may be tested.

In the tool room are tool grinders, milling machines and other necessary tools for the repairing of tools, gears, etc. The tempering of the small tools is also accomplished in this department, but the larger tools are forged and tempered in the forge shop.

Tender, Boiler, Erecting and Other Shops

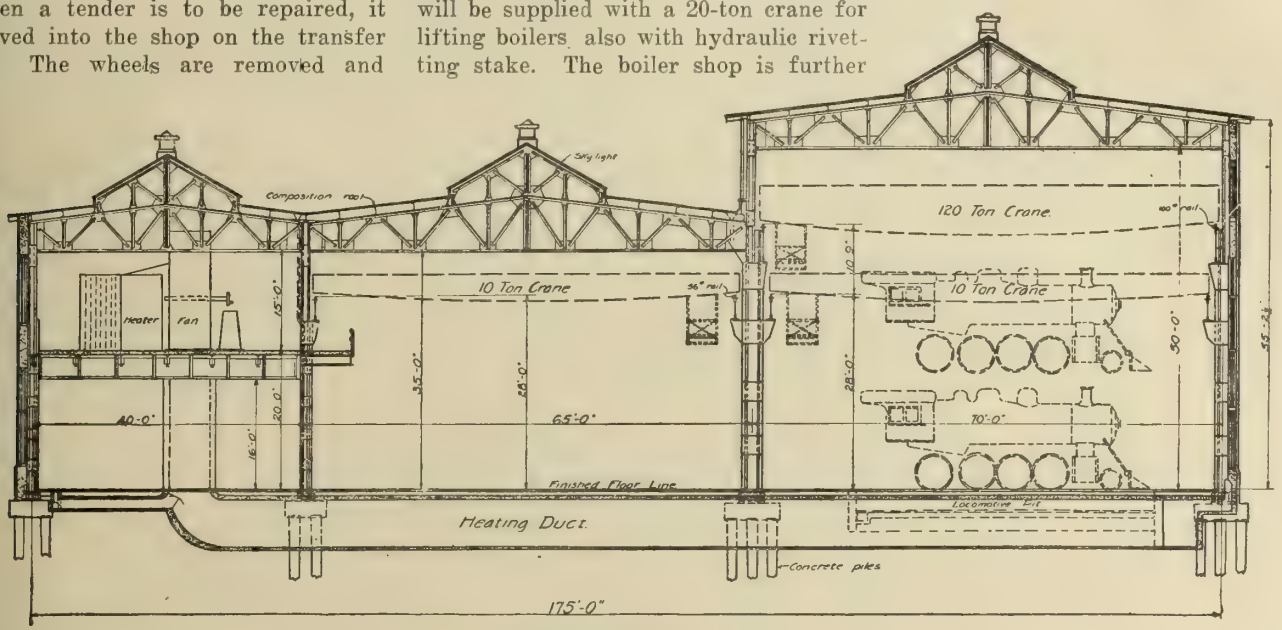
Elevated Tracks in Tender Shop; Overhead and Jib Crane Service in Erecting Shop and Other Special Features of the Shop Equipment.

Projecting north from the main building is the tender shop. This building is 325x103 feet and holds eighteen tenders. A 25-ton crane serves the tender shop. A transfer table runs the length of the tender shop.

When a tender is to be repaired, it is moved into the shop on the transfer table. The wheels are removed and taken to the elevated tracks where a workman may do the necessary repairing without bending over his work. The tracks are raised a height of 18 inches above the floor level in the two bays devoted to tender truck wheels.

Boiler Shop.

This shop is located on the west end of the machine and erecting shop, and is provided with stalls located on 22-foot centres. The shop is composed of two bays, one 70 feet wide and the other 65 feet wide. The 70-foot bay is served with a 30-ton crane, which runs upon a continuation of the 120-ton crane runway of the erecting shop. This is also served with a 10-ton messenger crane running below the 30-ton crane. The 65-foot bay is provided with a 10-ton crane. No rivetting tower has been provided in the present designs and if same is required in the future, an extra half bay will be built on the west end of the boiler shop, to the necessary height. This will be supplied with a 20-ton crane for lifting boilers, also with hydraulic rivetting stake. The boiler shop is further provided with flange and plate furnaces, which connect with flues in the west wall of the boiler shop. These flues are built inside pilasters of the building, being in cross-sectional area 18x24 inches, with walls eight inches thick extending a short distance above the roof line. Four such chimneys are provided in the west end of the boiler shop. The boiler shop is also provided with two test pits, 24 feet long and four feet wide, for testing boilers. These are located in the south-west corner of the building, adjacent to the flange furnaces.



CROSS SECTION
OF
MACHINE & ERECTING SHOP

Erecting Shop.

The erecting shop occupies the south bay of the main building shown in the accompanying section of the machine and erecting shops. There are 28 pits with 22-foot centres and provision has been made to extend it to 35 pits when necessary.

One foreman is in charge of the erecting shop. The work is divided up and a chargeman is responsible for the work alotted to his group. There are four gangs (1) one taking care of the steam chests, cylinder faces, slide bars and crossheads; (2) steam pipes and exhaust pipes, etc.; (3) mountings, dome covers, etc., and (4) stripping. The boiler work is under the supervision of the boiler shop.

The small work is conveyed by four-wheeled lorries. In shops such as the smith and forge shops, or in the yards, these run on tracks but no tracks are necessary for them in the erecting and machine departments.

The erecting bay is 70 feet in width. Locomotives enter and leave the building from the north side and a 35-foot and an 85-foot turntable are used in conveying the locomotives to and from the shop. The engine pits are provided with water, steam and compressed air connections. Electric lighting connections are also provided.

Jib cranes are arranged along the south side and also along the columns of the north side next the machine shop. The jib crane service is one of the features of the new shops. When the electric crane delivers castings to the erecting shop, the jib cranes are used to put the pieces in position. They are also of service in dismantling the locomotives.

The entire erecting shop is served with a 120-ton crane, capable of lifting the heaviest locomotive to a height clear of locomotives on the main floor, and

carrying same to any part of the shop desired. This method of handling is illustrated in Fig. 1. Directly below the 120-ton crane runway is a messenger crane of 10 tons' capacity, for handling the various parts of locomotives, such as drivers, trucks, engine frames, etc., which parts are not heavy enough to justify the use of the larger crane.

In order that the 120-ton crane may serve the last engine pit at the east end of the erecting shop, a pocket is provided for the 10-ton messenger crane by building an extra half-bay on the east end of the shop, to a height sufficient to allow the 10-ton crane to pass on beyond the last pit.

Interior of Erecting Shop, Showing Construction Large Locomotive Crane and General Arrangement of Pits. The Crane Lifts the Locomotive and Moves it to the Track Desired.

Smith and Repair Shops.

The smith shop is mostly devoted to spring work. This part of the works, including the forge shop and specific repair shop at the south of these two shops, were erected in 1904.

The specific repair shop contains two lines of tracks and will accommodate six locomotives or steam shovels requiring light repairs. There are two drop pits so that a pair of driving wheels may be removed without dismantling the locomotive. This shop is served by a small traveling crane in addition to jib cranes and a lorry track.

The tube shop is in a separate building at present, but provision has been made for it at the east end of the machine shop. The building at present used as a tube shop will be converted into a carpenter shop with the necessary equipment, including wood planer, band saw, lathe, drill, shaper, boring machine, grinder, etc.

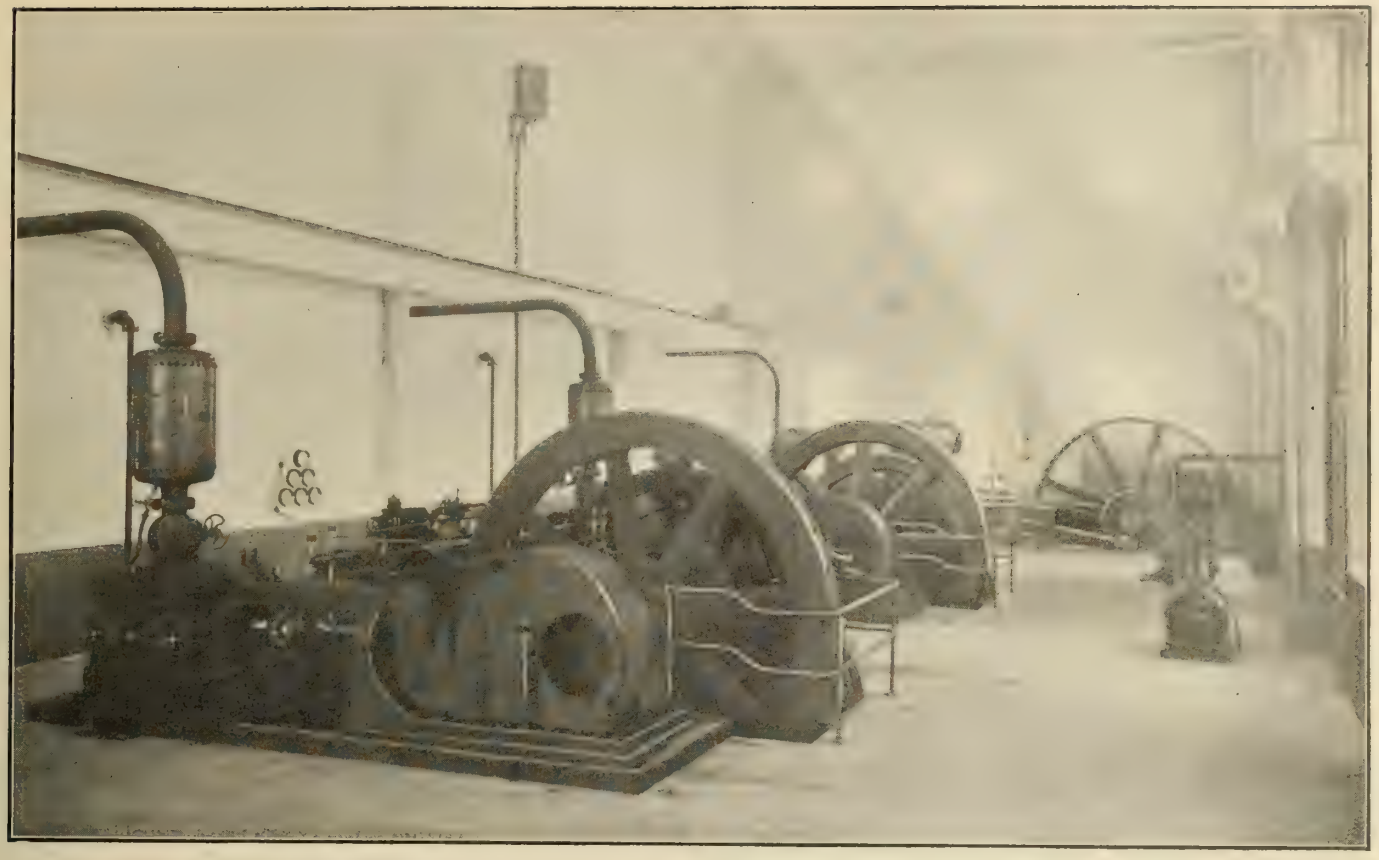
The brass foundry is well equipped for the work required. For melting the brass two rotary brass furnaces with oil as fuel are used.

ELECTRIC SMELTING.

Dr. Haanel, Director of Mines, has received a letter from the directors of the Electric Smelting Company at Ludvika, Sweden, whose guest he was last summer, announcing that the experiments then begun with a model electric smelting plant, following the design evolved by Dr. Haanel, have proven an entire success. The company has now made a contract for the installation by the summer of an electric smelting plant on a commercial scale for the production of pig iron. This will be the first one in the world to actively inaugurate electric smelting on a commercial basis. It is another proof that the new system, which means so much to the future of the iron industry of Canada, is commercially feasible, and will doubtless be followed by the installation of similar plants in this country.

RAILWAY ENGINEERS' CONVENTION.

William McNab, assistant chief engineer of the G. T. R. was elected president of the American Railway Engineering and Maintenance of Way Association at the tenth annual convention held in Chicago recently. More than 300 operating and engineering experts employed by the railroads of the United States and Canada are attending the convention.



Engine Room Showing Goldie & McCulloch Engines and Rand Air Compressor.

Central Power House Equipment, G.T.R. Shops, Stratford

Vertical Water Tube Boilers, Stokers, Coal Handling Plant, Engines, Generator, Pumps, Piping, Heating System, Etc.

The power house is a self-supported steel structure, reinforced with concrete walls, 90 feet by 108 feet. All walls and foundations below the ground line have been water-proofed.

There have been four vertical boilers installed, each being 350 h.p., a total of 1,400 h.p. Foundations have been built lor two more boilers which will bring the capacity up to 2,100 h.p. Green traveling chain grates and stokers are used, operated by small vertical engine.

The coal is dumped from the cars, and passing through a crusher, is conveyed to a steel receiver holding 250 tons of coal. Bucket conveyors carry the coal to the receiver from which it is conveyed by gravity to the different hoppers of the stokers. The same buckets remove the ashes and dump them into cars.

A Weber chimney 175 feet above the ground, or 187 feet, total height, furnishes draft to the four boilers, and is of sufficient capacity to take care of the additional two. The flue is 7 feet 6 inches.

The boilers work at 160 lbs. pressure. The header is 14 ins. diameter. From the header to the Goldie & McCulloch engines is a 7 in. steam pipe, 7 in. to Robb-Armstrong, 4 in. to each Waterous, McEwen and 5 in. to the Rand air compressor. All steam piping has been carefully covered by a good insulating covering.

A 20 H. P. motor drives the flue cleaner through Morse chain, motor operating at 690 R.P.M., flue cleaner at 440 R.P.M., chain 9 inch pitch 3½ inch wide, operating over 21 and 33 teeth on 22 inch centers, 1090 feet per minute.

The Engine Room.

The main units in the new engine room are two large Corliss Goldie & McCulloch compound engines, 19 and 34 X30 in. These are fitted with Sight Feed Oil Pump Co.'s oilers on the cylinders, and have independent steam gauges. The bearings are oiled by a gravity system. All the oil is returned to a Burt filter and pumped to an overhead tank where it is again ready for use. The low pressure cylinders are fitted with outside tail rests or shoes to keep the piston in alignment and from wearing the bottom of the cylinder.

These engines are each connected to a 400 k.w. Western Electric generator. The engines run at 150 r.p.m., and current generated is 220 volts d.c., direct current being used throughout the works.

In the foreground, but not shown in the illustrations, is being installed a Robb-Armstrong 18 and 28x24-in. This engine was in the old power plant and will be direct connected to a Westinghouse 300 k.w. generator.

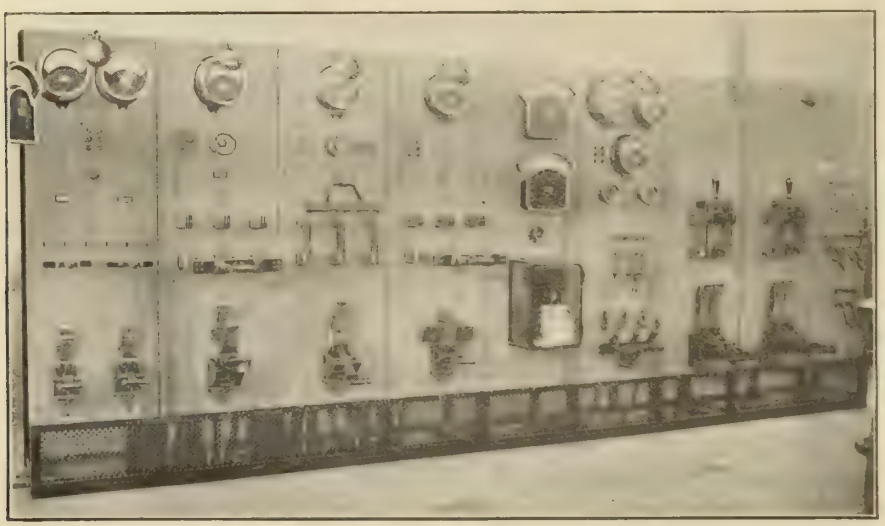
In the rear of the power house is a Rand air compressor and between it and the Goldie & McCulloch engines are being installed two Waterous-McEwen engines, which were in the old power plant. These engines are direct connected to 35 k.w. Canadian General Electric generators.

The Canadian Rand air compressor is steam-driven and an interesting feature of its construction is that the air cylinders are in the centre. The fly-wheel has been arranged for rope drive so that at any time the Corliss steam cylinders

may be disconnected and motor drive installed. This machine will compress 2,200 feet per minute and has water-cooled air cylinders.

Two gauge boards on the wall are for the air compressor and general purposes. The general purpose board has a clock, gauges showing main and exhaust, air pressure, vacuum and water pressure. The other gauge board shows the vacuum, high and low steam and high and low air. An Allis-Chalmers-Bullock motor balancing set of 20 k.w. has been installed, which reduces the voltage from 220 to 110, the voltage required by the Cooper-Hewitt system of lighting. With this exception, 220 volts is used throughout the shops.

The switchboard is Western Electric, and contains all the necessary equipment for the completed plant. It consists of nine panels of blue Vermont marble. There are four generator panels, one full load panel with Westinghouse graphic recorder wattmeter and ammeter. Provision has been made for taking the reading of any switch on the board. The equipment of this panel includes a differential voltmeter for the Allis-Chalmers-Bullock motor generator set. One panel is the equalizer, two power panels and one lighting panel. The instruments on the panels are Weston, with Canadian Westinghouse switches.



Switchboard in Engine Room, G.T.R., Stratford.

A ten-ton Smart-Turner traveling crane forms part of the equipment of the engine room.

Pump Room.

Two boiler feeding systems have been installed. A pump is used and each boiler is fitted with an inspirator, which is used as an auxiliary. Two boiler feed pumps have been installed, but either one is of sufficient capacity to supply the boilers.

A 100,000-gallon pump supplies the shops with water. This water is drawn from a tank situated in the yard. Water is pumped to the tank from the Little Lakes, 2½ miles east of Stratford, by a plant owned by the G.T.R. situated at the lakes. Water may be drawn from the city in case of emergency.

Two vacuum pumps take care of the heating system, either being able to do the work. The returns are pumped into a Cochrane heater and from there to the boiler. The boiler feed pump operates automatically. The pumps will be equipped with revolution counters so that the work of each pump will be registered. The piping is of Crane design, the whole pump house equipment being supplied by the Canada Foundry.

Piping System.

Piping from the power house to the shop is carried through an underground tunnel. The air pipes and power cables are also carried through this tunnel.

A separate system of piping is installed for drinking water, which is obtained from artesian wells, drilled on the shop site.

Water service lines loop all the buildings and provide fire protection, there being three yard and 30 shop hydrants located at points to cover every part of the works.

The entire building is heated by indirect radiation, utilizing exhaust steam from the power house in heaters. It may be necessary at times to assist the supply of exhaust steam by turning the live steam into the heaters, through a reducing valve. Three Sturtevant fans are operated by small horizontal engines the exhaust steam from which passes into the heating coils as an additional assistance to that supplied from power house. The experience up to the present time is that this system will provide ample heating requirements for the cold weather. The circulation of air throughout the shop is very good, keeping at the same temperature for the most part.

The air is taken in from outside by means of fans driven by small horizontal engines, exhaust steam of which also passes into heat coils. Fans, heaters, and engines are located on the balcony of the machine shop, the hot air being distributed through a system of underground reinforced concrete ducts with openings in walls and in ends of locomotive pits on the south side of the building. A small heating duct is also provided under the balcony and underground on the north side of the building, having vertical outlets through the floor.

The interior view of the power house, shows engines, air compressor and other equipment. A view of the switchboard, showing the equipment of it to control the lighting and electric power for the various shops, is also given.

G.T.R. STRATFORD ROUNDHOUSE.

The Stratford roundhouse has a very important relation to the work of the road at this point. It is a brick structure, situated in the large yards east of the station, and contains twenty-seven stalls where the iron horses are groomed and put in condition to go out again after each journey.

The engines enter from the west side to the turntables in the central space from which the stalls radiate. This turntable is driven by a little compressed air engine, which is charged from time to time as needed, from the reservoir in the roundhouse. To turn an engine to the track leading to the particular stall to which it is to be taken, the operator pulls a lever, and by another turn stops it when the desired point is reached.

Compressed air is used for cleaning engines, as motive power for tools, testing air brakes in the yard, and to apply pressure to the stores of oil beneath the store room. When any kind of oil is needed for use all that is necessary is to turn a tap. The pressure of air is regulated by a valve, so that while there may be 100 pounds at the reservoir, it can be reduced to 5 in the store room. There are three boilers and a stationary engine in the roundhouse, used to supply the compressed air, heat the building and wash out the boilers.

For the feeding of engines with water and coal, good provision has been made. The three tanks, two at the station, and one in the yard near the roundhouse, hold 100,000 gallons of water each.

The coal chutes in connection with the roundhouse are of up-to-date construction. Engines can be loaded with coal from both sides at the same time, and the spouts which carry the coal to the tender are so regulated that any quantity from one to twenty tons can be taken as desired.

System for Looking after Welfare of Employes

Conveniences for the Workmen, Lockers in Sufficient Numbers, Wash Basins, Etc. The G.T.R. System of Instruction of Apprentices.

In the arrangement of the G.T.R. shops the welfare of the men has been carefully looked after. It has been the policy of the G.T.R. to do this as the men appreciate the provision made for their comfort.

A sufficient number of lockers are provided for each workman in the shop, designed on the basis of 18 workmen per engine pit. One wash basin is provided for every four men. These lockers and wash basins are located in lavatory rooms directly under the heating fans. These rooms consist of two floors, ten-foot ceilings. This arrangement makes the lavatories and lockers easily accessible from both the main floor and 5the balcony, stairs being provided immediately adjacent to these rooms, extending from the main floor to the balcony.

The equipment of these rooms, consisting of basins and other conveniences, were supplied by the Standard Ideal Co., Port Hope. The illustration shows one of the wash rooms. Fountains are provided through the shops, the water being pumped from artesian wells, drilled on the site.

The health of the men is provided for. Not only has sanitary equipment been provided, but a Railroad Y.M.C.A., provided with baths, swimming pools, etc., is accessible to the employes.

Rooms are provided for instruction of apprentices who meet every Tuesday and Thursday. Six teachers give instruction in mechanical drawing and practical mechanics. During the day the chargemen look after the apprentices in their gangs.

These rooms contains an oven where the dinners of the employes are warmed. The employes can then sit down at a table and have their hot soup or tea.

Apprenticeship System.

The first requisite in employing an apprentice is to know that he is morally, physically and mentally capable of filling the requirements of a mechanic. In order that this may be ascertained the apprentice is required to make his application direct to the master mechanic or general foreman. He must be not under fifteen nor over eighteen years of age, and he is required to undergo a medical examination to assure the head of the department that he is healthy and likely to be able to follow up the trade after he has completed the term of apprenticeship. After this the candidate is required to pass an examination in the master mechanic's office.

As a test of eyesight the applicant must be able to read extracts from instructions at the end of an employe's train time table printed in very small type, standing at a distance of thirty inches from it and as a test of hearing he must be able to hear the ticking of an ordinary open face watch at a distance of four feet. There are prescribed tests of writing and spelling from dictation and tests in figures sufficient to show whether the applicant has a general knowledge of the simple elements of arithmetic.

The candidates are required to write this examination out on foolscap paper and, if satisfactory, it is copied by him into the record book kept in the master mechanic's office so that a complete record of the boy's ability is kept from the day he first enters the service. All apprentices, it may be remarked, are indentured to the various trades for five years. Five cents per day is deducted from each apprentice and the total amount is returned to him at the expiration of his apprenticeship with an addition of twenty-five dollars as a bonus if services have been entirely satisfactory.

Interior View of one of the Workmen's Washrooms.

Night Classes and Exams.

The apprentices are required to attend a night drawing class and a class in applied mechanics for six months in the year—from October to April—and there are few absentees. Attendance at these classes is compulsory and a satisfactory explanation must be given by an apprentice who is absent on any night.

Every April examinations in drawing and applied mechanics are held over the entire system. The papers for the examination are prepared by James Powell, chief draughtsman, at Montreal, and the company gives prizes for each class of apprentices at the different shops —a prize for each successful competitor in the first, second, third, fourth and fifth year apprentice examinations. Then there is one general prize for the whole system, the class obtaining the highest number of marks being awarded it, and there is also an individual prize for apprentices getting the highest number of marks over the whole system.

The system, in which Master Mechanic Patterson, of Stratford, takes a deep interest and does all he can to advance, insures thorough education in all details of the trade. The apprentices go from the boiler shop to the machine shop, from the machine shop to the motion bench, the side rod bench, the axle-box gang, the steam pipe gang, the valve gang, and, finally, the erecting gang, so that after an apprentice is out of his time he is a specialist in any of these branches. The system of apprentices has not only resulted in the boys getting a better education, but has elevated the moral standing of their work.

The system has been made attractive to boys who have passed the high school entrance examinations, and who, well-advanced along the lines of school education, adopt the mechanic's trade in preference to other pursuits. The company offers inducements to remain to those they have trained, and many high positions in the service are occupied by old apprentices.

System is the Key-note in the Stratford Shops

All Tools Can be Accounted for, Messenger and Telephone Systems are Being Installed, and a Premium System of Rewarding Workmen is in Use.

A central tool room has been provided for the machine shop with a separate one for the boiler shop. There is also a central stores in the machine shop and the same system of giving out tools, etc., is used in these three as well as the template room.

At present if a workman wants a tool he gives a check with his number and becomes responsible for the tool until it is returned, when he again receives his check. A list of the men with their numbers is kept in the tool room so that the man in charge can tell when he is giving the tools to the proper persons.

Telephone System.

A telephone system is at present being installed, in order that a mechanic will lose no time going after tools. Telephones are being installed in the offices, store departments, tool rooms and various other departments. A telephone will be supplied to every two gangs in the erecting shop.

When a mechanic requires a tool, blue print, etc., he telephones to the proper department and a messenger is at once despatched with it. It is the same if he requires something from the stores department. If a tool requires forging, the workman telephones for a boy who takes the tool to the forge shop and returns it when it is ready. In this way a workman loses no time.

The Stores.

The main stores is separate from the main shops, and contains about a month's supply. All the supplies are arranged so that any article may be obtained without any delay. Everything is arranged for quick handling. The oil tanks are underneath the floor, but compressed air has been applied to the pumping of it and supplies of oil are quickly obtained.

In the machine department there is a central stores where about a week's supply is kept. When the telephone system is in working order messengers will deliver supplies as required.

A watchmen's system is being installed. They will carry portable clocks and keys will be arranged so that all parts of the shops will be covered. At present a check system is in use similar to that described in the February issue of Canadian Machinery, but plans are being made for a new system.

Premium System.

A premium system of rewarding the employes is in use. Prices are set for the different work and on the completion of the work the mechanic receives his bonus. If a workman gets behind on a job he must give satisfactory reasons, for the prices set are given according to past practice, taking into consideration any extra work, such as erecting, more faces to machine, extra fitting, etc.

On large work where a long time is required to finish a number of pieces, a premium is paid when half the number is completed. The chargeman who is responsible for the work in a certain group also shares in the premiums. This system is found to work very satisfactorily.

Everything is systematized. The scrap metals are arranged according to quality in bins in the yard to facilitate loading, all work is passed through the shops with the least possible handling and schemes carefully planned out beforehand. This is seen from the manner in which the new shops have been designed and the machinery placed. The saving of time is a great item when locomotives are to be repaired and the system adopted in the several departments at the Stratford shops facilitates the making of repairs and assists in accomplishing work quickly.

TO DETERMINE ACTUAL PLANER SPEED.

The following is taken from a catalogue describing the high-speed planers made by Bateman's Machine Tool Company, Limited, Leeds, England:

The old practice of judging the comparative values of planing machines, by comparing their speeds on cut and return, has been found very misleading. This is because of the momentary stoppage of the table at each end of the stroke and the time lost before full speed is attained after reversal. In some machines these losses are very considerable and materially reduce the productiveness of the tool, and if such machines were sped up, the loss on reversal would be enormously increased. The only accurate means of ascertaining the earning capacity of a planer is to take the cycle time, as indicated below.

Time of cycle = time of 1 cut + time of 1 return.

L = length of stroke in feet.

T = time of N cycles in seconds.

N = number of cycles.

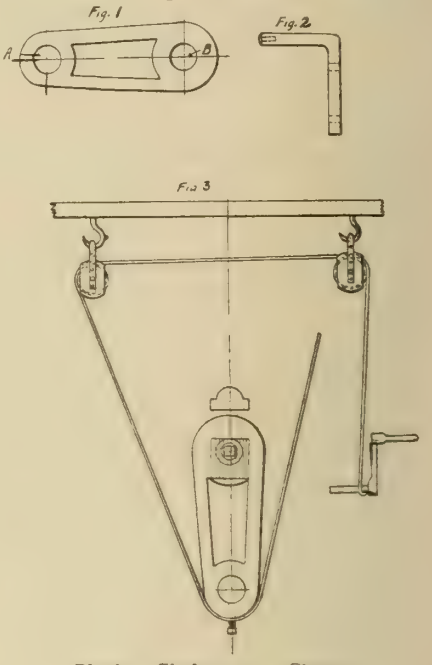
Average (or earning) speed = $\frac{2L \times N \times 60}{T}$

Thus a 42-in. by 14-ft. machine completes 10 cycles in 3 minutes 56 seconds (236 seconds) when on a 14-ft. stroke. Therefore, the average speed is

$$\frac{14 \times 2 \times 10 \times 60}{236} = 71 \text{ ft. per minute.}$$

PLANING CIRCLES ON A SHAPER.

It was my good fortune to see a rig for planing circles on a shaper a few days ago, says a writer in Modern Machinery. This arrangement was so ingenious and simple that I describe it for the benefit of those of your readers who may have occasion to use it in "their business." Fig 1 (A and B) shows the casting to be planed. Fig. 2 shows a forging that is bolted on the front of the shaper table. A collar was



Planing Circles on a Shaper.

made to fit tight (moderately) in the holes A and B, but loose on the forging bolted to the table. A small set screw was run in the oil holes leading to A and B and attached to the set screw in the loose end of the casting was a small wire cable leading to a couple of pulley blocks, fastened to the ceiling and leading down to the feed on the shaper and fastened to the feed bar. The cable wound around the feed bar as it eevolved and pulled the casting around at each stroke of the machine with the same precision as on a plane surface.

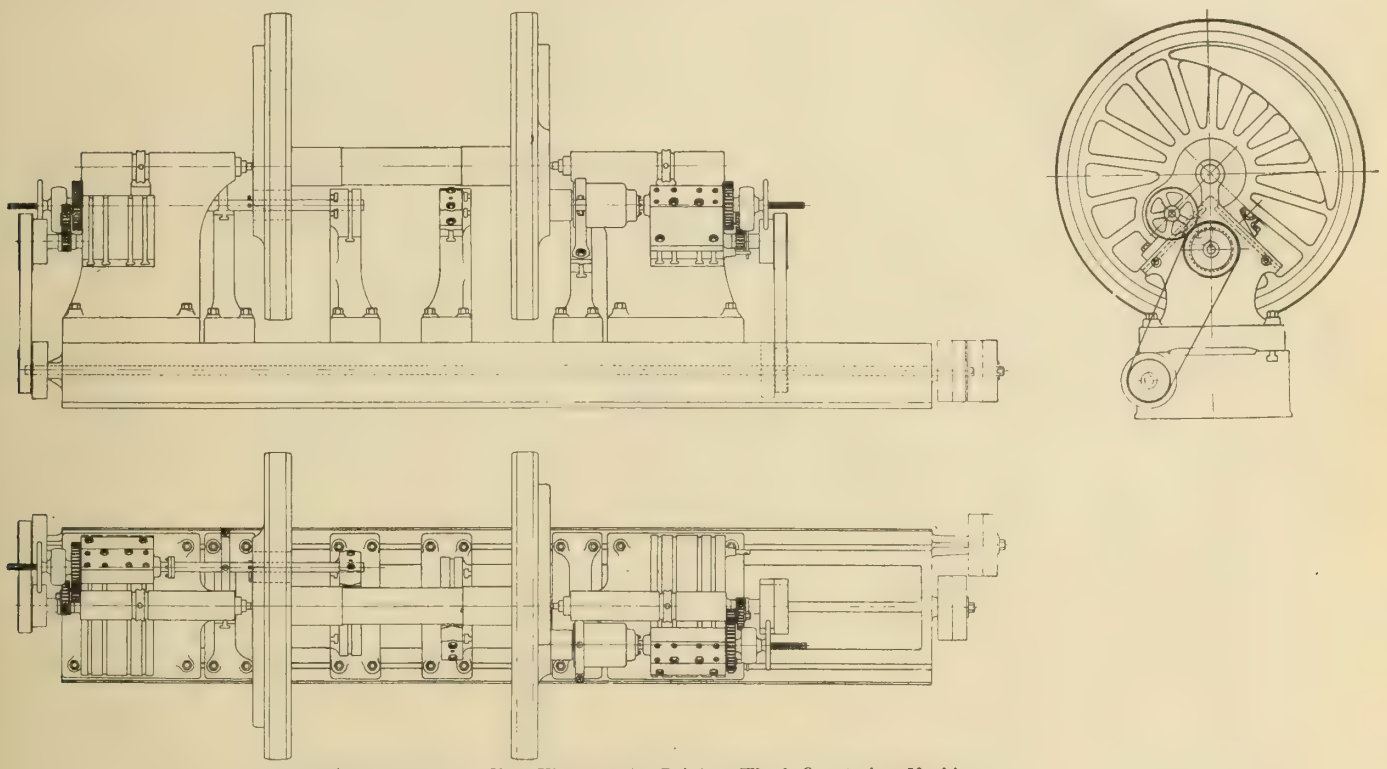
When one-half the circle was planed the cable was unwound and taken out of both blocks and passed up again through the block above the feed and the same process repeated. The plan was very ingeniously thought out and did perfect work. Fig. 3 shows the whole arrangement. A large washer and cap screw screwed in the end of the forging bolted to the table served to keep the casting in place.

Quartering Machine at Grand Trunk Shops, Stratford

The Arrangement of Driving-wheel Quartering and Crank-pin Turning Machine, Showing the Details of Tools used for the Purpose.

One of the most interesting machines in the Stratford shops is a driving-wheel quartering and crank pin turning machine. The original machine was supplied by Craven Bros. and the attachments by which both the boring and turning are accomplished were designed and constructed at the Stratford shops.

Both operations, boring the crankpin holes and turning the crankpins, are accomplished on this machine. The wheels are placed in position as shown in the half tone and also in the line drawing. It will be noted that on the right is shown the arrangement for boring the crankpin holes in the driving wheels. The two wheels are bored at once by the boring bar arrangement shown.



Elevation, Top and End View of the Driving Wheel Quartering Machine.

Turning Crankpins.

From boring crankpin holes to turning crankpins the change may be made in a few minutes. Two, three or four tools may be used to turn a crankpin and as two crankpins are turned at once, four bearings may be turned in one operation.

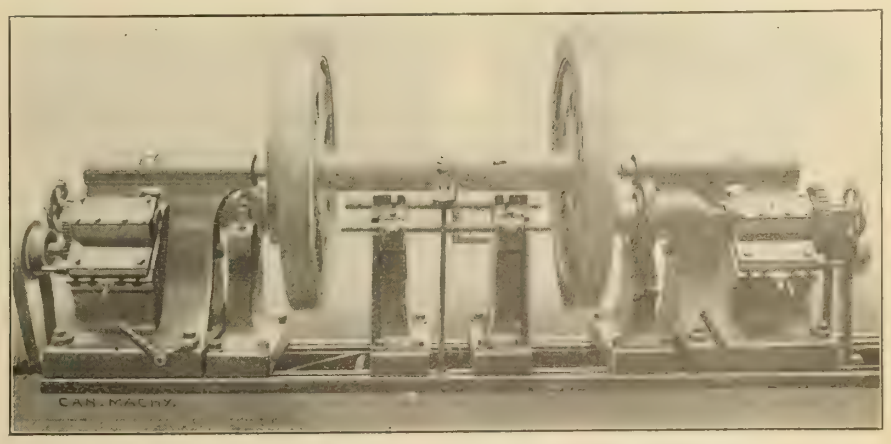
The crankpins are turned perfectly in quarter and both crankpins are turned at the same time. If wheels come in for repairs and the crankpins are found to be out of true, they are turned up. Crankpins are never removed from driving wheels for repairs. If for any reason a crankpin must be repaired a new one is put in its place.

The right hand head shown in the line drawing of the machine is equipped for turning crankpins. The machine has a capacity of from 22 inch to 32 inch stroke. With it, crankpins are turned in parallel with the centers of the axle and correct quartering is ensured.

Details of Turning Head.

The second line cut shows the details of the crankpin turning equipment for the driving-wheel quartering machine. The cast iron head is bolted to the shaft in the same manner as the boring bar. Inserted in the head are steel bushings to hold the tools. The arrangement of the tools in the head is here shown.

A supplementary brass bearing supports the boring bar through the turning head bearing when boring crankpin hubs. This bearing is shown at the right in the line cut of details. The construction of the machine itself with the arrangement of driving gear may be seen from the line cut and half tone.



Driving Wheel Quartering Machine Fitted with Crank Turning Arrangement.

PERSONAL.

Mr. A. F. McArthur, city engineer of Guelph, has been appointed city engineer for Yorkton.

L. A. Candall has accepted a position with J. W. Paxton, Philadelphia, as manager of their western branch.

Messrs. S. Gagne, and Gordon T. Jennings, B.Sc., have opened an office as consulting engineers in the Lawlor Building, corner Yonge and King Sts. Toronto, Ont.

J. A. Coulter, president and manager of the John Morrow Machine Screw Co., is the new chairman of the Ingersoll Board of Trade.

G. Hebb has been appointed road foreman of the Central division of the C. P.R., vice A. West, appointed district master mechanic at Kenora, Ont.

Mr. J. R. Heddle, late assistant city engineer at Hamilton, Ontario, has been appointed city engineer of Brandon, Man. Duties to commence not later than May 1st.

J. H. Mills, formerly district master mechanic of the C. P. R., at Farnham, Que., has been appointed acting master mechanic on that road, with headquarters at West Toronto, Ont.

F. Rowlandson, formerly locomotive foreman on the C.P.R. at Brownville Jct., Me., has been appointed locomotive foreman on that road at West Toronto, Ont.

J. R. Spragge, formerly district master mechanic on the C.P.R. has been transferred to the Ontario division of that road, with headquarters at West Toronto, Ont.

J. Kenneth Craig, lately with the Windsor, N.S., Foundry, has received the appointment of manager and secretary-treasurer of the Bridgetown Foundry Co in the place of his father, the late W. A Craig.

Mr. Dix-Fraser, superintendent of the blast furnace plant, at Port Arthur, has returned from a trip to some industrial centres in the United States. He says his company intend to operate their plant again this spring.

R. Livingston Fernbach, chemical engineer, whose headquarters were formerly at Boston, advises us that he has opened general offices at 97 Warren street, New York City, and is maintaining laboratories at Brooklyn, Boston and Montreal.

The duties of mechanical engineer, locomotive branch, at the Angus shops of the Canadian Pacific Railway at Montreal, heretofore performed by A. W. Horsey, who has been appointed master mechanic on that road at Smith's Falls, Ont., will hereafter be carried on by Mr. G. I. Evans, chief draughtsman.

J. C. McCarty, of Brooklyn, N.Y., president of the Canadian Tool & Shovel Co., visited the Hamilton plant recently. He was accompanied by his son, E. W. McCarty, who is a director of the company, and his brother, Right Rev. Monsignor McCarty. They are interested in asbestos mines in Quebec.

A. H. Eager, formerly district master mechanic on the C.P.R. at Kenora, Ont., has been appointed locomotive foreman on that road at Calgary, Alta.

J. C. Garden, formerly general shop foreman on the G.T.R., at Toronto, has been appointed master mechanic on that road at Montreal, Que.

J. Duguid, who has been appointed general foreman G.T.R. shops, Toronto, was presented with a gold watch, Feb. 20, by the employes of the machine and erecting shops, Stratford, Ont., on his leaving there to assume his new duties. At the same time Mrs. Duguid was presented with a silver tea service.

George W. Robb, former general foreman of the Grand Trunk machine shops at Ottawa, was recently made the recipient of a handsome cabinet of silverware from the employes of the shops The presentation was made owing to the fact that Mr. Robb was leaving for Winnipeg, where he is to occupy the position of assistant master mechanic of the Grand Trunk Pacific.

Mr. J. F. B. Vandeleur, 3 Dineen Building, Toronto, Canadian agent for Messrs. Reavell & Co., Ipswich; Gilbert Arc Lamp Co., Chingford; Laurence, Scott, Norwich; Evershed & Vignoles London, and several other well-known English firms, has just returned from England after a three months' business trip. While abroad Mr. Vandeleur called on his different principals and the prospects for the development of trade relations between English engineering concerns and Canada look promising.

Adoption of a Standard Thread for Taps and Dies

A Proposal to Eliminate the Old V Thread for Taps and Dies; Advantages of U. S. Standard for Bolts, Nuts, Railroad Work, Etc.

For a number of years the tap and die makers have had under consideration the advisability of discontinuing the regular manufacture for stock of V-thread taps and dies, and the general adoption of the United States Standard or Sellers form for all 60-degree screw threads.

The "V-Standard" No Standard.

The V-standard so called is a "standard" existing only in theory; in practice the V-thread, nominally an equilateral triangle in section, is flatted at the top an amount varying with the practice of the different manufacturers. It is, of course, recognized that the slightly flatted top is an essential feature of this thread, as it is a mechanical impossibility to maintain the size of a tap with perfectly sharp threads while a single hole is being tapped; the removal of the metal during the operation causing the sharp tops to be worn away and the original diameter to be lost almost from the outset.

Difference in Diameter.

In cutting down the V-thread in the tap, some makers stop at one point, some at another. One concern may cut down to a pitch diameter 0.010 inch over the theoretical size, believing that the flat thus left at the top of the thread presents just sufficient surface to give satisfactory results; while another manufacturer may cut the thread a little deeper, and still another not quite so deep. No two work to the same dimensions and the result is that the actual thread diameters, measured in the V, differ with every make. This fact is well illustrated by the accompanying table which gives the diameters adopted by various makers whose names and products are known throughout the manufacturing world.

A comparison of these figures with the true or theoretical pitch-line diameters of the perfectly sharp V, as given in the fourth column from the right of the table, will reveal some interesting irregularities. The values in this column are equivalent to the outside diamter of tne threaded piece less the depth of a single thread, as computed by the formula:

$$\text{Pitch diameter equals } D - \frac{0.866}{P}.$$

where P equals the number of threads per inch and D the outside diameter. The columns headed A, B, C, etc., represent the actual sizes worked to by the different tap manufacturers. Thus in column A will be found the diameters adopted by one concern, while column B shows the practice of another maker; and so on across the table.

Considering, for example, the ¼-inch 20-thread size, the tabulated data show that this is made all the way from 0.0023 to 0.0103 inch larger than the standard pitch-line diameter; and, in the case of the ½-inch 12-thread, the range throughout the different lines is from 0.0062 to 0.0142 inch oversize in the thread angle. The ⅜-inch 10-thread dimensions show an increase over the theoretical diameter ranging with different makers from 0.0068 to 0.0136 inch and in the case of the 1-iach 8-thread size the oversize allowance is from 0.008 to 0.0182 inch. The variation for other sizes may be readily found by merely subtracting the values under the alphabetically headed columns from the corresponding sizes given in the column at the right of the table.

Advantages of the U.S. Standard.

There can be no question as to the supremacy of the United States standard form of thread. Devised over 40 years ago and recommended by the Franklin Institute for general adoption by engineers, it has become the standard of the United States Government, and is used by practically all the railroads, bolt and nut makers and progressive manufacturers.

In 1898, the International Congress of Engineers convening at Zurich, adopted this form of thread as the best for metric sizes and pitches, and it is now in almost universal use throughout the continental countries. More recently the Association of Licensed Automobile Manufacturers has adopted it as the standard of the organization, and in 1907 it was accepted by the American Society of Mechanical Engineers as the standard form of thread for machine screws.

For many years this standard form of thread with depth equal to Pitch X 0.6495, has been supplied by tap and die manufacturers, with practical interchangeability. The outline of the thread is such that it may be cut to the correct theoretical depth and to the true pitch-line diameter without the allowances found necessary when cutting the so-called sharp V-thread. It will be seen by comparing the pitch diameters of the United States Standard with even the largest of the V-thread diameters, that the United States Standard is a little larger in every case. This allows the retapping of any V-thread hole to bring it up to standard size, and avoids the necessity of discarding any machine parts but the screws or bolts.

Accurate Cost Keeping as an Aid in Manufacturing

Fourth Article on the Cost System Used by the Canadian Locomotive Company in which the Methods of Making the Labor and Material Summary are Described.

The summary of labor and material is what might be called the climax of the cost system. The whole system in use at the Canadian Locomotive Works, Kingston, has been carefully studied out so that when a contract for locomotives is completed, the cost of them is easily and quickly arrived at.

Card No. 1 is the form used in making the labor summary. The workman's number is filled in and the number of hours he is engaged in the work, opposite his number. These cards are filed under different contracts. Numbers designate the name of the part, these numbers being stamped at the top. For instance ash pans will be 1, ashpan details 2, etc. Each labor summary card

Form 4. LABOR. Previous Cost

OPERATION NAME OF PART

Contract ... SKETCH PATTERN CARD } No.

Commenced Finished

No.	Hrs.	Hrs.	Hrs.	Hrs.	Hrs.	Hrs.	Hrs.	Tot. Hrs.	Rate	Amount.

Fig. 1.—The Labor Summary Card.

pertaining to ashpan details will be numbered 2.

Each shop has its own color, the machine shop is white; boiler shop, yellow; carpenter shop, red; smith shop, green, etc. A glance will therefore show the cards belonging to each department. All the cards on ashpans are filed under that name and having the cards of a different color facilitates the finding of a card showing the work in a certain department. This applies to any part, as pistons, connecting rod brasses, etc.

The total labor in each department is then entered on card shown in Fig. 2. This is the card on which the total labor and material is entered. The amounts are then transferred to the final cost summary card, fig. 5. The premiums are added to the labor cards, Fig. 1, and the total on card shown in Fig. 2, is the total productive labor.

To get the total cost a percentage for non-productive labor and factory expenses is added to the total productive labor cost. The percentage is calculated on the productive labor. This percentage is also added to obtain the total cost of any part of a locomotive. By this system the labor cost on any part can be seen at any time.

The percentage added includes under the heading of unproductive labor, the president, manager, foremen, office staff, draftsmen, watchmen, etc. They do not bring any direct income to the establishment, but are as necessary to the success of the business as the producers. The personality of the men and the system employed is a feature in the success of the business.

There are a great number of expenses under the heading of factory expenses, which are included in the percentage. These are insurance, taxes, depreciation, repairs to machinery and building, scrap pile, spoiled work, fuel, light, telephone, stationery, postage, telegrams, traveling expenses, freight, express, etc.

Material Summary.

When an order comes for a number of locomotives, the superintendent notifies the chief draftsman who, according to experience, calculates the amount of material required to fill all orders. This list is made in a standard book form and a copy is sent to the storekeeper who knows what material is on hand. A card system is used to show the material bought and material used.

The head draftsman gets out the necessary drawings and the foremen of the departments are supplied with them. All faces to be machined are marked, thus greatly facilitating the handling of work in the shops.

From the drawings the foremen make out their orders or requisitions, fig. 3, for material which is presented to the stock-keeper. These call for a certain amount of bar-iron, mountings, piping, etc., and must give the drawing number

and the name of the particular part of the locomotive for which the material is required.

When a contract is entered into, cards shown in fig. 4 are filled in at the top in the drafting office from the book of specifications. These cards are kept in the cost department and are filled in and checked off, from the requisition cards, fig. 3, which are delivered to the cost department by the store-keeper every day. The summary is made on cards shown in fig. 4. The final summary is made on card shown in fig. 5, the different items mentioned being self explanatory.

ACCURATE BORING FOR LARGE DIAMETERS.

By Fred Newell.

In boring large holes or cylinders where accuracy is an important feature, such as for press and shrink fits, etc., or indeed in any case where one has to bore to a pin gauge, I believe the following diagram will be of practical value in providing an easy method of determining the required size of bore. It is well known that if one uses a pin-gauge of the exact size of bore required, that it is impossible to make a trial until the bore is at least the correct size, and most often one finds that he is just a little over size and has to reduce the finishing cut after entry, making a bell-mouthed bore, to say the least of it, not a very creditable job.

It is for this reason that many shops make a practice of using a pin gauge, a definite size too short and giving it a calculated amount of travel. These calculations require an amount of accuracy and time which can be better utilized in other directions by those in charge of the machine shop, or tool room, and by the use of this diagram one can be more certain of arriving at correct results than when a separate calculation has to be made each time.

On the horizontal axis of the diagram can be read off the travel of the gauge "T" opposite to the required diameter "D" and on the vertical axis, the necessary amount "D-L" the corresponding pin gauge is to be made short of the finished diameter.

If these gauges are to be stored for future use, it is a good plain to have them marked with the size of bore they will give and the amount of travel; should they require to be checked over at any time, their exact length can easily be found from the diagram.

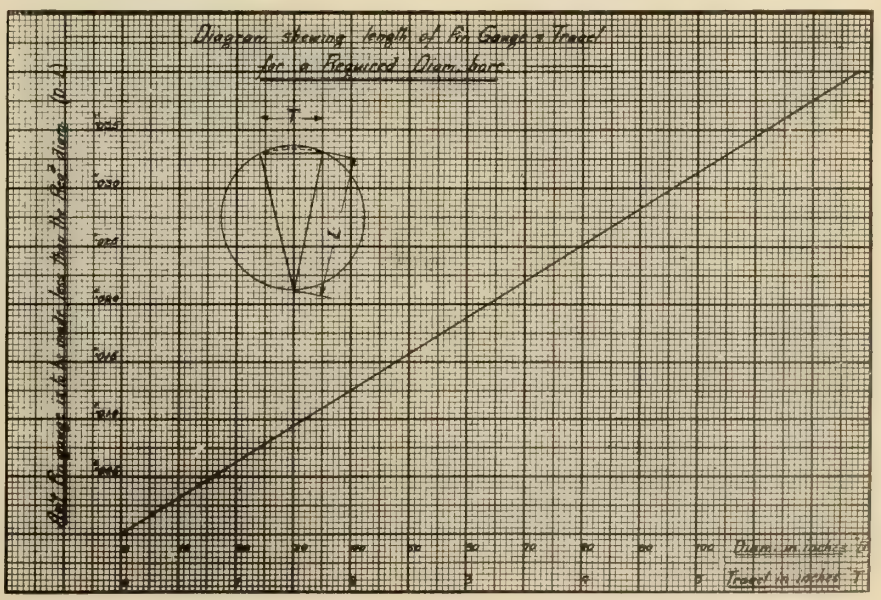

Diagram Showing Length of Pin Gauge and Travel. The Vertical Length Shows the Amount that Pin is to be made Smaller than Required Diameter.

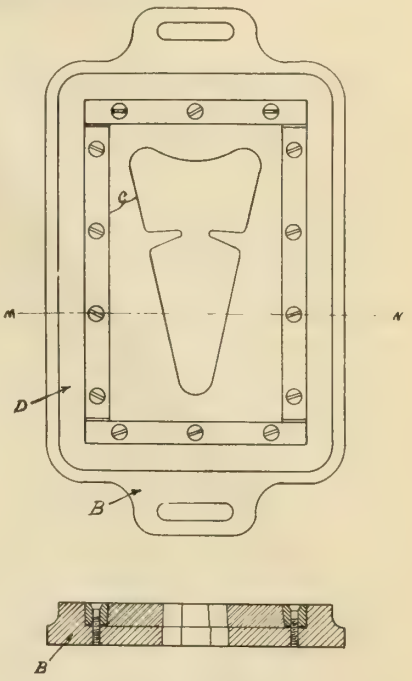
A. S. McAllister, Secretary of the Point St. Charles Railway Y.M.C.A., has been transferred to a similar position at Kenora, Ont.

REPAIRING BLANKING DIE.

By J. H. Rogers.

The accompanying sketch shows the way that a broken blanking die was repaired to avoid making a new die.



Repairing Blanking Die.

The bed, B, was cast with the raised boss, D; the four inner surfaces were shaped out square, and the four sides of the die were ground with a slight bevel as shown in section cut. Four strips were closely fitted between the die and the four sides of the boss, D, allowing a little draw. When the screws were tightened the die was securely fastened, thus giving the die no chance to open at the crack, C.

MACHINE SHOP METHODS AND DEVICES

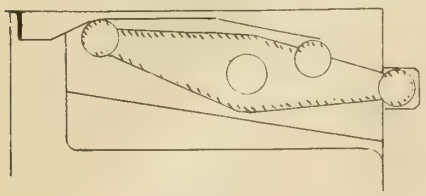
AUTOMATIC UNDERCUTTING TOOL.

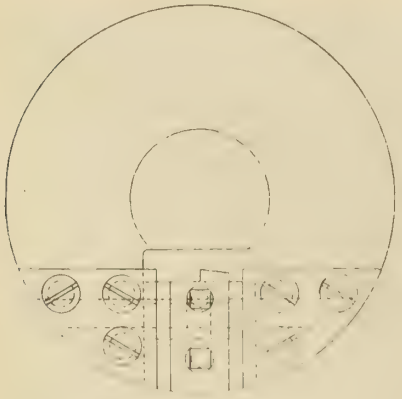
By W. Petessen.

The tool shown in sketch was designed for the purpose of cutting a clearance for the thread, under the shoulder of a brass plug, and has been used with good results on a Prentice automatic chucking lathe. It can, however, also



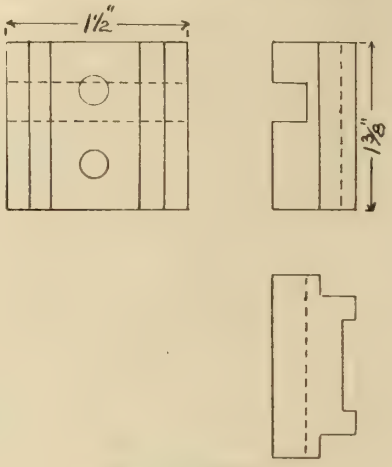
The Lever Arm.

be put to good use on any machine, where it is necessary to have the tool mounted on a revolving spindle, and to hold the work stationary in a vise, as for instance on a drillpress or screwing machine. The work or the tool may then be fed forward, and this motion is utilized to advance the cutter into the work.



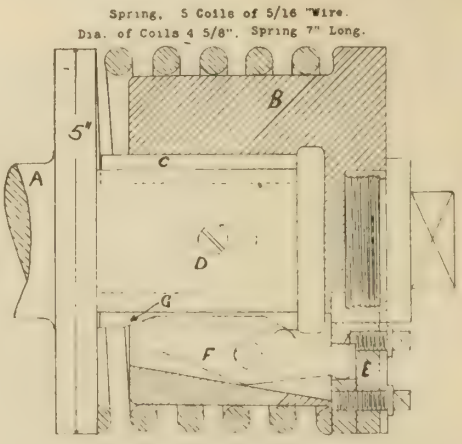
The main feature of the tool consists of the spindle A, which is chucked in the machine. On this spindle a sleeve, B, has been mounted, and keyed by the feather C, leaving it a sliding fit. A movement of 7-16 is secured by the slot in the sleeve, and the screw which enters the spindle at D. The coiled spring always keeps the tool extended when it is not engaged with the work. A small toolslide E has been mounted on the face of sleeve B, which is controlled in its movements by lever F which is part of the feeding mechanism.

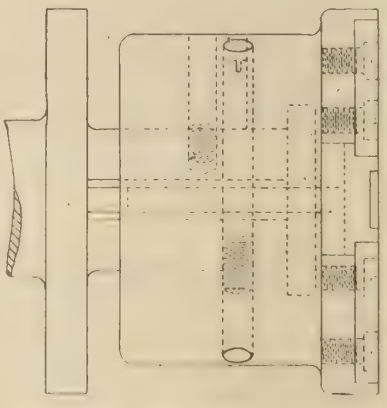
The operation of the tool is as follows: The plug to be machined is fed forward through the usual motion of the machine in use, and when the end of it comes in contact with sleeve B, it



Steel Tool Holder.

causes the latter to slide back on the spindle and in doing so the lever F mounts the taper incline on the feeding key G, thus moving toolslide E





End View, Section and Plan with Spring Removed.

towards the centre, and cutting the groove to the required depth.

In order to prevent the tool from digging in, and also to insure that it is promptly withdrawn before contact between the tool and plug cases, on the backward stroke, the feeding key and lever are both provided with two projections and it is easily seen that the toolslide is always under positive control. This tool does not admit of a large range of diameters, but it can of course be made up to suit any size required, and it possesses the advantage that there is not any elaborate setting required as it can be taken out of the machine and reset in a few minutes.

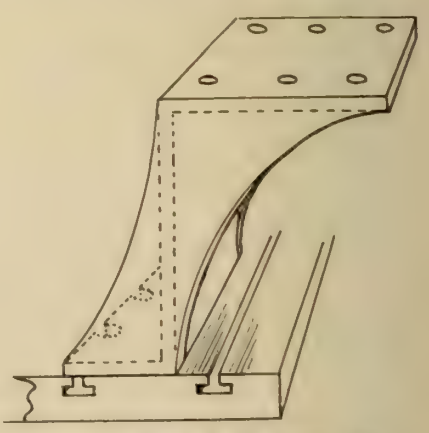
DOUBLE ANGLE PLATE.

By Mac. K.

On several occasions I have had longer work than a radial drill table would accommodate. In order to overcome the difficulty I devised a double angle plate which I have found very serviceable.

The accompanying illustration shows the double angle plate bolted to the drill base. This shows it bolted at the second slot of the drill base, but for handling work longer than the radial drill table it is bolted in the first slot.

It is planed the same height as the



Double Angle Plate for Radial Drill.

table is from the drill base. The ones I am using are 18 inches high with top plate 12x15 inches. The base plate is 6x12 inches slotted for bolts. The angle plate is made ½ inch thick with ⅞ inch ribs on both sides.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

LONDON MACHINE TOOL CO.'S BORING MILL.

The boring mill illustrated herewith was built especially for the Otis-Fensom Elevator Co., Hamilton. It is a 60-inch mill with three heads designed for the rapid turning, grooving and boring of elevator drums. The mill is now in use at the Hamilton works of the Otis-Fensom Company and is giving very satisfactory results.

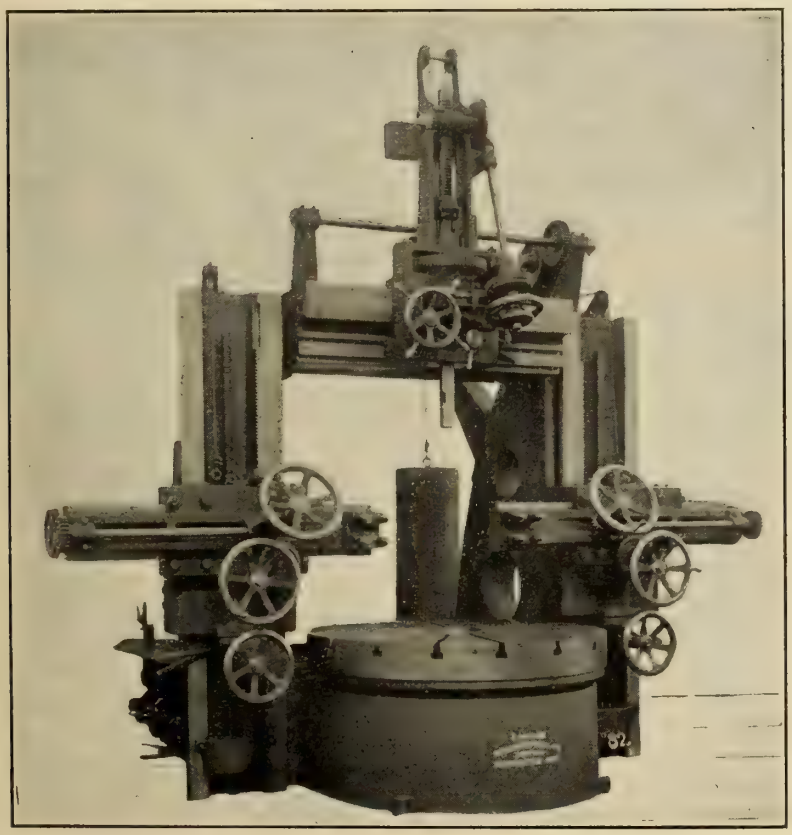
The mill has three heads, each head being controlled by an instantaneous gear changing device by means of which speeds ranging from seven-sixteenths to one and seven-eights can be cut. By throwing a lever the same mechanism gives turning speeds of .0625 to .266.

The boring head is on the cross-rail. It is operated by a separate motor. The turning motors are on the standards. Both boring and turning motors are equipped with electric brakes, the design of the Otis-Fensom Elevator Company. The motors are also manufactured by the Otis-Fensom Elevator Company.

The machining of the drums is accomplished in one setting and the drums are machined in much less time than formerly. The boring mill is massive and weighs 35,000 lbs.

The side heads weigh approximately 3,000 lbs. each, but can be operated by hand with great ease. The control of the boring mill is convenient to the operator. The gearing is very heavy and made of steel.

The boring mill is manufactured by The London Machine Tool Company, Hamilton.



London Machine Tool Co's. Boring Mill Installed in the Works of the Otis-Fenson Elevator Co.

BULLARD SUPPLEMENTARY TURRET.

The Bullard Machine Co. have placed on the market a new device to facilitate the handling of tools on their vertical boring mills. It consists of a turret tool holder instead of the regular tool head and fits in the tool head in place of it. Fig. 1 illustrates the method of holding, the lever drawing the tool head solidly up against the slide by means of an eccentric and locking it in its correct position by a long contact between bevel shoulders on both the tool head and slide, at the back. The locking of the cam is adjusted by the long bolt at the top so as to always insure the supplementary turret being properly locked.

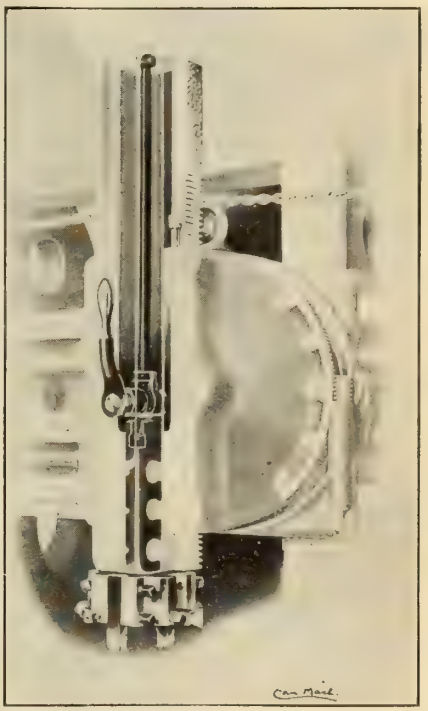


Fig. 1.—The Bullard Supplementary Turret.

This method has many advantages. After a roughing cut is taken, the handle is loosened, the turret turned to bring the finishing tool into place, the turret locked, the head adjusted, and

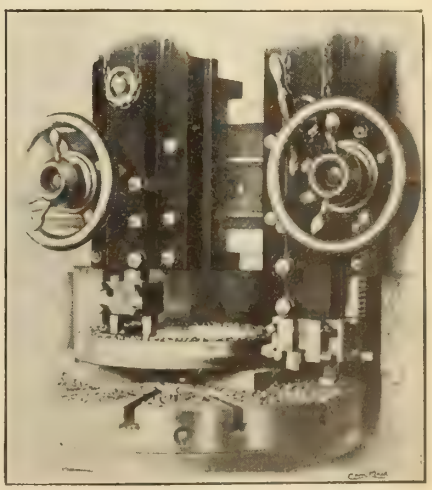

Fig. 2.—Two Turrets in Use.

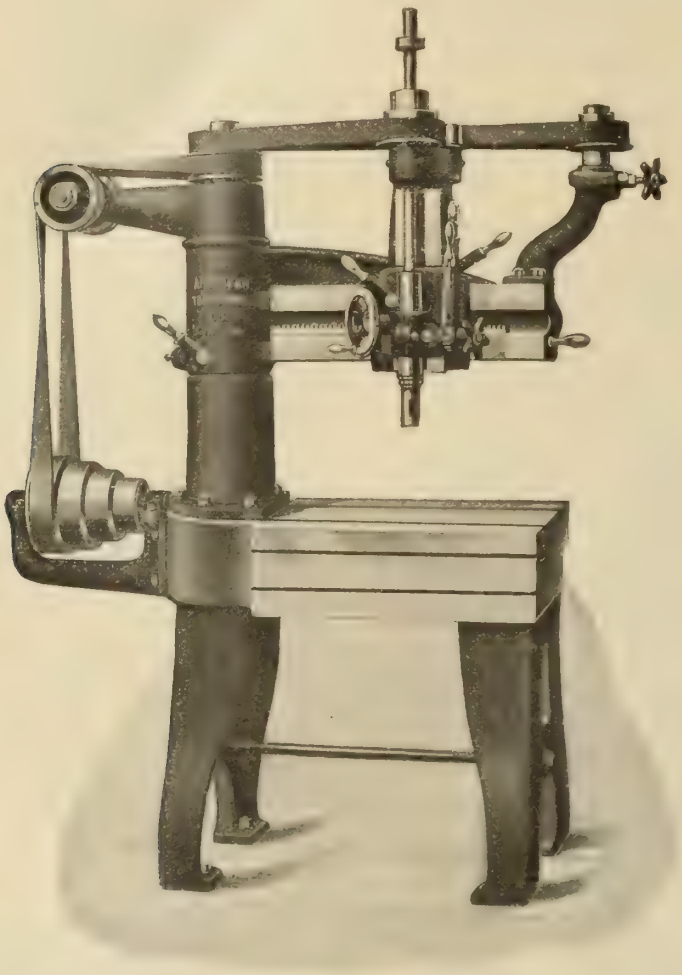
the next cut is taken. Without taking out a tool, the boring and facing tools are brought into position one after the

other and the time saved is more than might be imagined unless it is realized that in many cases the setting of tools takes a third of the total time of manufacture.

Fig. 2 illustrates the use of supplementary turrets in both heads with eight tools in readiness for various cuts. The supplementary turret can be applied to boring mills now in use and does not interfere with the use of the mill in the regular way or any other tool. The supplementary turrets are made by the Bullard Machine Tool Co., Bridgeport, Conn.



High Speed Sensitive Radial Drill.

HIGH-SPEED SENSITIVE RADIAL DRILL.

This is the pioneer of radial sensitive drills and is designed by the American Tool Works Co., Cincinnati. The drill shown is a 2 ft. machine but it will also be built with a 5 ft. arm. Tapping attachments may be used with either of these machines.

The general design is such as to greatly simplify operation of the machine. All levers are directly at the operator's hand, and the movement of the head and arm, in locating same for drilling, is most easily and quickly accomplished.

There are no gears in the driving mechanism of this drill from the countershaft through to the main spindle, it being driven by means of a 2 in. double belt running at a high rate of speed, thus transmitting an abundance of power and speed direct to the spindle of the drill. The spindle belt is kept at proper tension by turning the star knob shown at the top.

All the driving and idler pulleys are equipped with ball bearings, which consist of a double set of hardened and ground ball races and cones, one set being located at each end of the pulley journals.

The spindle is of high carbon crucible steel, accurately ground and provided with a dust proof self-lubricating ball thrust bearing. Has six changes of speed, ranging from 300 to 900 r.p.m. in geometrical progression, obtainable through a 2-speed countershaft and 3-step cone pulley, regularly furnished. Is provided at the top with an adjustable stop collar, which may be used as a depth gauge. Spindle is fed by a long hand lever on ratchet wheel, the latch handle being self-releasing when in the uppermost position. A convenient star wheel supplies quick return to the spindle.

The head is of special design and is moved rapidly along the arm by hand wheel through angular rack, and spiral pinion, and may be clamped at any point along the arm by the lever shown at the right of head. Head consists of the main saddle which slides upon the arm and carries an auxiliary sliding head upon a vertical dovetail. This allows a vertical movement to the head thereby covering the full range of work between the table and the arm.

WALKER TOOL ROOM GRINDER.

Illustrated herewith is the latest form of the Walker Tool Room Grinder, called the No. 2 Outfit "K" which has several important improvements over previous forms of this machine.

As seen from the illustration, the machine has a substantial column, to which are attached tool cupboards and upon which is mounted the sliding carriage, having transverse movement on V tracks, and so designed that there is an absence of overhang at each point of the cross feed stroke. The machine has automatic cross feed at each end of the stroke by means of an adjustable crank disc, plainly shown in the cut, which operates a double acting ratchet, thus providing cross feed in both directions. Automatic longitudinal feed is obtained by means of worm and worm gear, running in oil in the gear box shown at the left, the worm shaft having bronzed bushed bearings and a two step pulley belted from a small counter attached to a carriage in the rear (not shown).

The most notable feature of this machine, however, is the unique and novel grinding head and improved belt drive. All the angular adjustments are in the grinder head, which is capable of being horizontally swivelled 180 degrees and the spindle of which can be vertically swivelled 45 degrees, and at the same time the grinding wheel can be raised or lowered in any of its angular positions without varying the tension of the belt. It will thus be seen that it is not necessary to employ any of the insecure devices for clamping heavy cutters in angular positions, that the cutter can remain securely fastened in a horizontal position, and that clearance is obtained by setting the wheel at the desired angle. These machines have been made for some time with a vertically tilting spindle, but recent improvements in this are shown in the outline cuts.

Fig. 2 shows a vertical cross section through the wheel post and housing, and the grinding spindle; Fig. 3 is a similar view to Fig. 2, with the grinding spindle vertically tilted; Fig. 4 is a ground plan of Fig. 3; Fig. 5 is the

same view as Fig. 3, with the wheel post B and grinding spindle D swivelled 90 degrees horizontally; Fig. 6 is a view of the left hand side of Fig. 5. Fig. 7 is a diagram view showing Fig. 6 swivelled 180 degrees. Here it will be noted that the driving belt has traveled to the opposite end of the drum A.

The post B has vertical adjustment, but does not swivel in its housing, the housing having a swivelling adjustment on the line XY, which practically coincides with the down leading side of the spindle belt, so that when the housing is swivelled as in Fig. 4 the belt will run in quarter turn. This belt in leading to the spindle pulley D passes first around the idler E, thence to the spindle and out again and around the idler G and down to the idler H, whence it returns to the drum A. It will thus be seen that a horizontal loop is formed in the leading side of the belt, which provides for vertical adjustment without change of belt tension, and also that when the spindle is tilted its axis passes between the idlers E and G, and the belt will simply run in a twist. It is, however, necessary, in order to prevent the crowding of the belt on the flanges of the idler E, to arrange this idler in a swivel bracket, so that its central plane of rotation will be toward the center of the rim of the spindle pulley D. This is plainly shown in the plan view, Fig. 4.

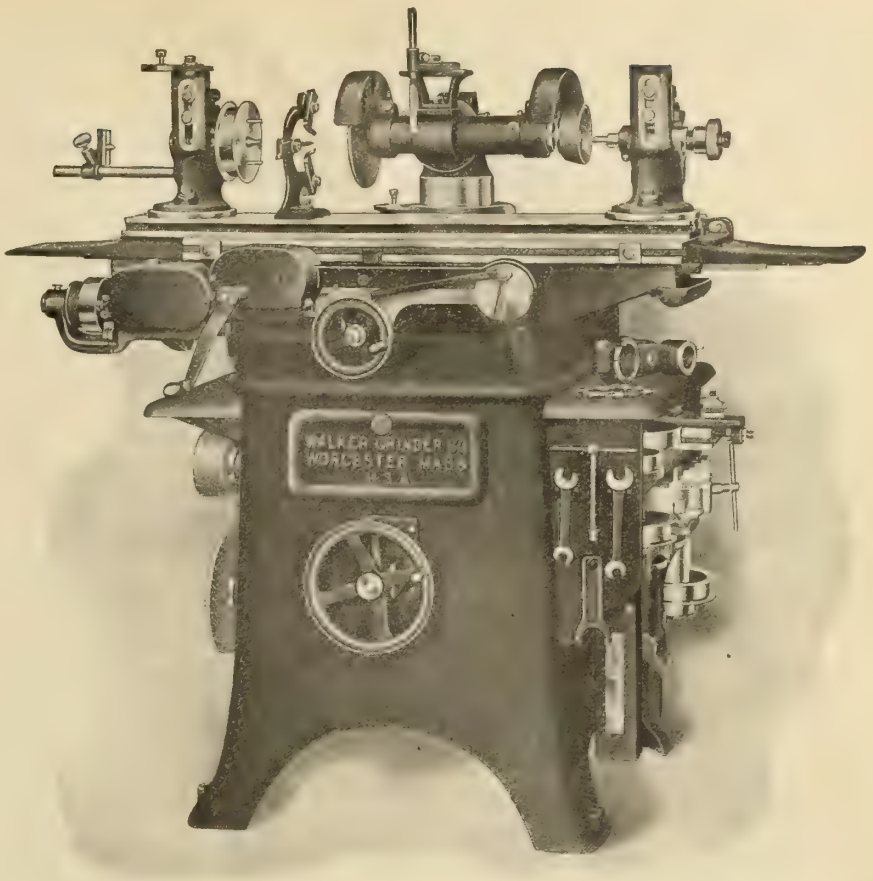


Fig. 1.—General View of the Walker Tool Room Grinder, the New Belt Drive of which is Fully Described and Illustrated in this Issue.

This grinder is manufactured by the Walker Grinder Co., Worcester, Mass.

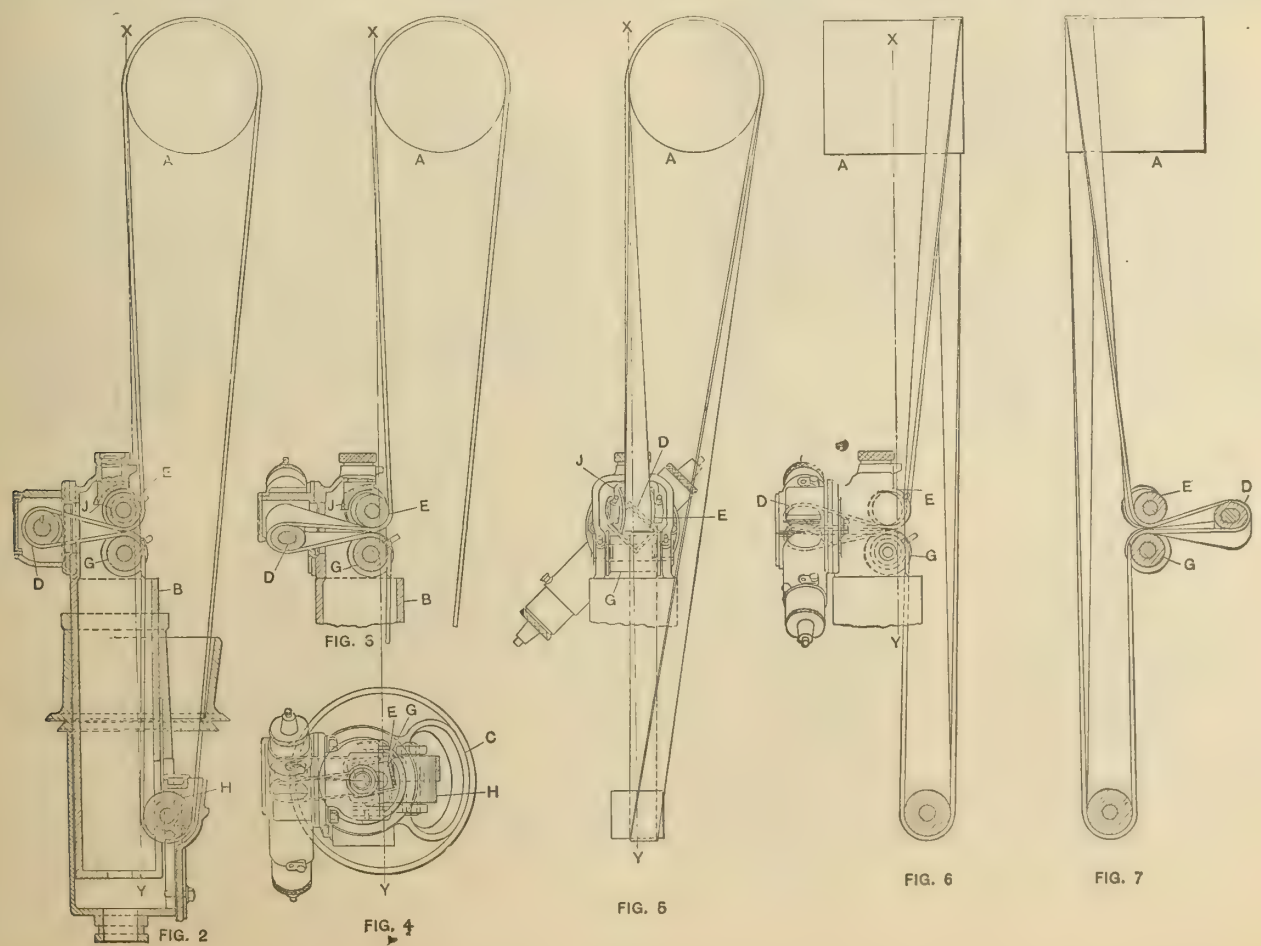

FIG. 2 FIG. 3 FIG. 4 FIG. 5 FIG. 6 FIG. 7

VALVE-INSERTING MACHINE.

The old adage that "Necessity is the mother of invention" is as true to-day as ever, and has been proved anew in the instance of the Hoefer valve-inserting machine, the necessity of which was suggested by a water works superintendent, who felt the need of replacing some old valves in his water works system, as well as placing new valves.

This new machine with a simple, special valve as shown in cuts Figs. 1, 2, 3 and 4, furnishes a very reliable way of overcoming the difficulties of installing a valve and does it without shutting off the water.

The comparatively low cost of this machine brings it within the reach of any water works plant, where the shutting off of water from the customer is a great annoyance, and where danger from fire is great when water is shut off for the making of a cut to insert a valve, and the further necessity of installing new hydrants, or replacing the old ordinary, double nozzle hydrants with hydrants with steamer nozzles. This simple machine will appeal to the water works fraternity.

Construction and Operation.

The object of this machine is to provide means for inserting valves into a pipe under pressure, and with a minimum interruption of the flow through the pipe.

The embodiment of this new device of inserting a valve into a pipe, comprises a sectional valve casing, which is permanently secured upon the pipe at the point where the valve is to be inserted. This casing consists of two sections, which are secured together fluid tight by means of bolts, and the ordinary valve dome carrying the valve mechanism. The two sections have semi-cylindrical flanges to embrace the pipe. A fluid tight connection between the casing and the pipe is obtained in the usual manner, with a lead caulked joint.

The pipe cutting mechanism is carried by a casing shown in Figs. 1, 2 and 3 which is temporarily attached to an open side of the valve casing in a fluid tight manner by bolts, so as to enclose the pipe cutting mechanism in the valve casing.

After the two sections of the valve casing are permanently secured upon the pipe and the saw casing with the saw mechanism temporarily secured to the open side of the valve, the saws are then properly set with the blades equally distant from the valve seats and operated until the blades have cut a seat into the pipe, insuring a proper start for the blade ; but before the cut is made through the wall of the pipe, the dome carrying the valve gates and stem is permanently bolted on the top of the two sections of the valve casing as shown in Figs. 2, 3 and 4.

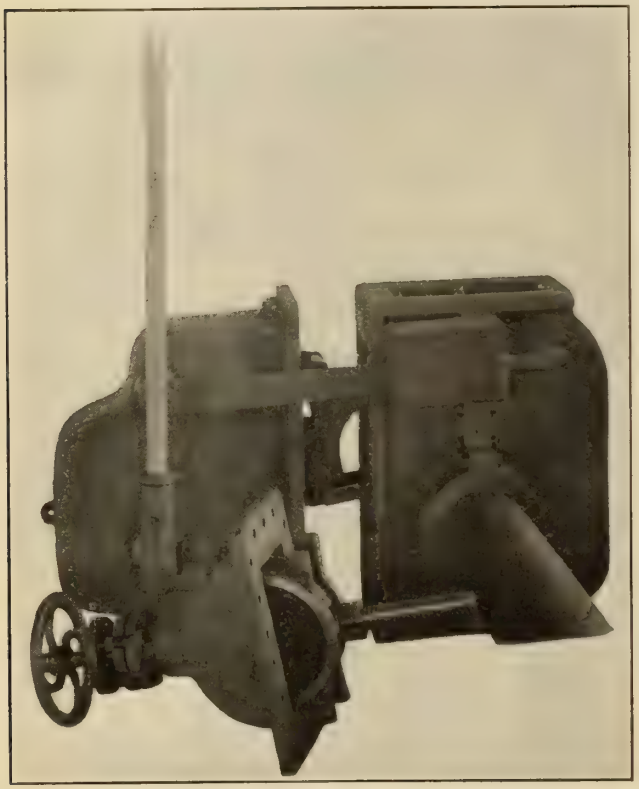

Fig. 1.—First Operation, Valve Inserting Machine.

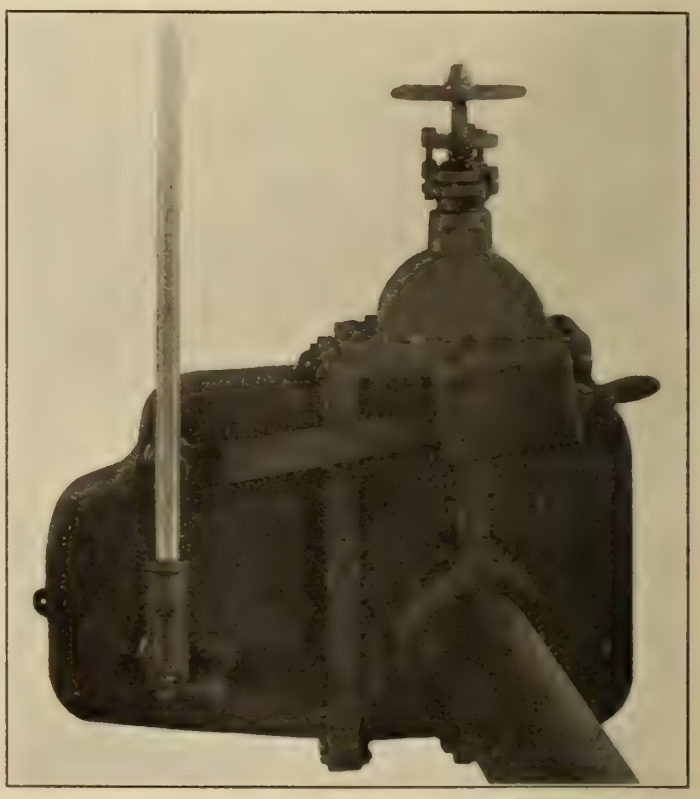

Fig. 2.—Second Operation, Valve Inserting Machine.

The pipe cutting mechanism consists of two parallel saw frames connected together by cross pieces. To these saw frames are attached metal saw blades especially made for this purpose. The means for obtaining the reciprocating motion of the saws consists of a rocking shaft supported in stuffing boxes in the walls of the saw casing.

On this shaft is keyed a crank arm to which the saw frames are connected by means of a link. On this same shaft extended through the stuffing box, is attached a lever by means of which the saws are given the recipro-

cating motion, and are fed through the pipe by means of an outside adjustable weight which transmits its pressure to the saw blades, through a shaft and arm, to which a roller is attached bearing upon the saw frame.

When the section of the pipe between the valve seats is cut off, it is withdrawn into the casing of the machine by swinging the operating lever downward as shown in cut Fig. 3.

As the saws cut through the pipe, the valve casing including saw casing fills with water. When the section has been cut out of the pipe and drawn into the saw casing, the gates of the vaive are then screwed down onto their seats thus shutting off the flow through the pipe. The valve and saw casings having been drained by opening the pet cock provided for this purpose; the water may thus be caught in a vessel and prevented from running into the trench to the great annoyance of the workmen. The saw casing with the mechanism is removed from the valve casing and a plate forming part of the valve casing is permanently bolted to the open side of the valve casing as illustrated in Fig. 4. It will be observed that the flow through the pipe is interrupted only while the machine is being removed and the plate substituted, an operation which consumes but a very few minutes.

The valve mechanism is of the common double-gate expansible valve construction of a well-known type, manufactured by the Ludlow Valve Mfg. Co., Troy, N.Y.

This machine is not only useful for the insertion of valves, but can also be used in every day shop work, where it is necessary to cut pipe, in which case, one saw blade may be taken out and special pipe holders attached to the machine.

VARIABLE VOLUME AIR COMPRESSOR.

By H. V. Haight*

The accompanying cuts are from the rope driven air compressor built by the Canadian Rand Co., Ltd., for the British Columbia Copper Co., and described on pages 37, 38 and 39 of the May, 1908, issue of Canadian Machinery.

This machine is a 25x16x36 duplex-tandem air compressor, having a capacity of 3474 cubic feet, and driven by a 600 horse-power motor by means of a rope drive. The special feature of the machine is the unloading device by which one-quarter of the load is thrown off at a time, by holding open one high-pressure Corliss inlet valve and one low-pressure Corliss inlet valve at each step. In reality the low-pressure Corliss valve is held open slightly before its corresponding high-pressure valve. This makes the unloading and the taking up of the load again come in practically eight steps and allows a little drop in the intercooler pressure between the four regular steps. This is well shown in Fig. 5 where the low-pressure cylinder is taking up its load.

These cards show almost perfect valve action both when compressing and when running unloaded. Further evidence of the very complete unloading of the machine is shown by the fact that the starting current, required for the alternating motor which runs the machine, does not exceed the full-load current. The completeness of the unloading as well as the very small friction of the motor, rope drive and compressor is also shown by the fact that the machine will run six minutes after the current is cut off.

The action of the unloader in maintaining steady air pressure is shown by the recording-gage diagram, Fig. 6. It will be seen that the machine is shut down from noon to 1 p.m., from 6 to 7 p.m. and also from 1 a.m. to 7 a.m. From 1 p.m. to 6 p.m. the machine is often overloaded, probably on account of opening up an air pipe to blow away the smoke from blasting. Except when overloaded or shut down the pressure is maintained at 97 to 100 pounds; the maximum variation does not exceed three pounds.

*Chief Engineer, Canadian Rand Co.

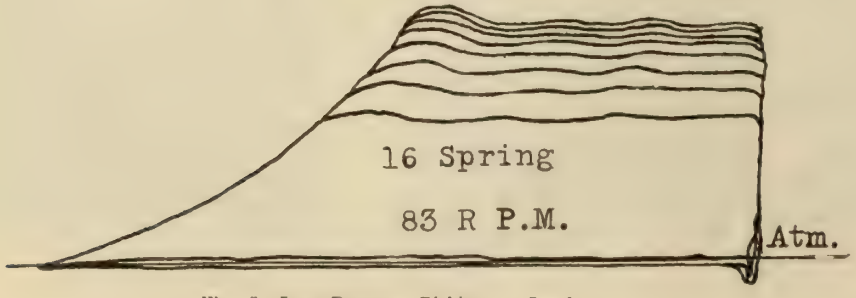

Fig. 5.—Low Pressure, Picking up Load.

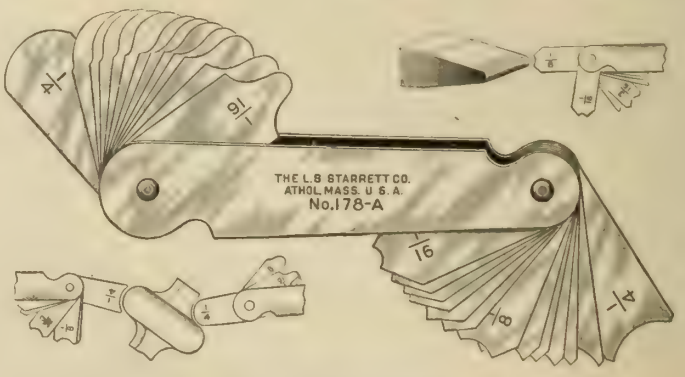
FILLET OR RADIAL GAUGE.

This gauge is referred to as a Concave and Convex Gauge and is especially adapted for use in laying out special forming tools, dies, etc., as well as for measuring fillets. The illustrations show a few of the ways in which the gauge can be used. It is for the use of machinists and tool makers as well as pattern makers.



Fillet or Radius Gauge.

Size A has 26 leaves stamped to indicate radii by 64ths, from 1-16 in. to 1-4 in. (one-half diametric size). Diameters are from 1-8 in. to ½ in., varying by 32nds.

Size B is made with 32 leaves stamped to indicate radii by 64ths, from 17-64 in. to ½ in. Diameters are from 17-32 in. to 1 in., varying by 32nds.

They are being placed on the market by the L. S. Starrett Co., Athol, Mass.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

SUBSCRIPTION RATE.

Canada, United States, $1.00. Great Britain, Australia and other colonies 4s. 6d., per year; other countries, $1.50. Advertising rates on request.

Subscribers who are not receiving their paper regularly will confer a favor on us by letting us know. We should be notified at once of any change in address, giving both old and new.

Vol. V. APRIL, 1909 No. 4

ABOUT OURSELVES.

Canadian Machinery is accepted as a positive factor in the machine shop and foundry fields, and in technical education. That our efforts have been appreciated is without a doubt. The list of subscribers is growing steadily and there has been a constant demand for back numbers containing articles on cost-keeping and apprenticeship systems.

This demand has been so great, that, although we printed extra copies of the March issue, our supply has been exhausted. A late order came in from Montreal for two hundred copies, which, unfortunately, we were unable to fill.

About 1,100 extra copies of the April issue are being printed. The article on the Stratford shops is one of the leading features. Other articles are on cost-keeping, foundry practice, etc.

Our editorial ideals have grown with the paper, and though we have made great strides, we have been unable to overtake them. We have plans made for some articles to appear in future which will be of great interest. These include some up-to-date cost systems, articles on grinding, machine work and foundry practice. We are making careful selections and have secured articles from some well-known contributors. Among them is an article on Multiple Core Molds, by H. J. McCaslin. It is practical and interesting and will be one of the features of the May issue, which will be a special convention number.

The American Foundrymen's Association, and allied associations, meet in Cincinnati the week of May 17. Our pre-convention number will contain full particulars in regard to the convention.

Naturally the manner of treating subjects changes with the development of the paper. Your suggestions and criticisms will aid us materially to reach the end towards which we are striving, to give readers matter best fitted to their needs. We spare no expense to get good material. Our editorial columns contain a fund of information for manufacturers, superintendents, foremen, mechanics and foundrymen. Subscriptions continue to come in from all over Canada and our representatives in the different provinces are meeting with excellent results. With the co-operation of our readers and advertisers we will make Canadian Machinery a still greater credit, not only to ourselves, but to the profession and business we are endeavoring to assist.

JAPANESE TRADE POSSIBILITIES.

W. T. R. Preston, Canadian Trade Commissioner to Japan, gives some interesting data in regard to Japanese conditions. There are possibilities of Canadian manufacturers enlarging their exports by catering to Japanese trade. We take the following extracts from Mr. Preston's report:

Mica is being imported from Korea, India, Germany, United States and Great Britain. The importation of mica in the last three years has increased from $7,000 to $60,000. With the steady development of the electrical industry in Japan, there is little doubt that the importations will increase considerably. This fact should be decidedly interesting to exporters of Canadian mica.

The following table shows the amount of mica exported from Canada:

Exported to—	Quantity, lbs.
Great Britain	245,988
United States	643.571
Others	21,143

By comparing the figures in the above table with the importations of mica into Japan, it will be seen that about 80 per cent. of the export of Canadian mica goes to the United States, while the proportion of mica coming to Japan from the United States is 62 per cent. of the total import.

From an examination of the imported United States product, it almost leads to the conclusion that not a little of this is Canadian mineral. The same condition exists with lead. Iit is learned from what seems to be absolutely reliable authority, that a considerable portion of this material imported to Japan from the United States is actually Canadian product.

The increased demand for steam engines and boilers and other forms of motor power furnishes an insight into the development of industrial life of Japan. The importation of these classes of machinery was not much more than 200,000 yen ($100,000) in the year preceding the China war, and has now reached within measurable distance of three million yen annually ($1,500,000).

It is also noticeable that there has been a steady increase in the use of motive power, while in the last 10 years the number worked by manual labor has not increased in so great a proportion.

Of the motive power used in this country, steam stands first, then electric, and the kerosene or gas engine is third on the list:

Total H.P. in factories	288,523
Steam H.P.	203,002
Dynamo H.P.	30,353
Motor H.P.	23,716

The ordinary small engine and boiler of about 50 h.p. or less is made in Japan. The larger ones, however, as well as a certain class of special small engines, are imported from Great Britain, United States, France and Germany, in the order named. The recent increase in the importation of machinery has, however, been mainly caused by the sudden expansion of cotton-spinning factories,

which took place immediately after the war with Russia. The orders for machinery to meet the expansion of this business will not all be delivered until towards the end of this year, so that there will not be any decrease in the value of the importation of machinery in 1908.

It is assumed that the number of steam engines used in the various industries in Japan at the end of 1906 was 55,400. A great number of these will be replaced in the near future by engines and boilers of greater power, as well as having to be replaced on account of becoming useless through wear and tear. The opportunities, therefore, for business are obvious.

The following statement gives the importation of turning lathes into Japan, during the last ten years:

	Yen.
1898	243,863
1899	331,070
1900	231,403
1901	709,105
1902	473.084
1903	178,109
1904	837,615
1905	3,349.617
1906	1,120,405
1907	1,014,560

Between 1905 and 1907, the percentage of this business with Great Britain increased from 35 to 75 per cent., while the corresponding percentage of the business with the United States has decreased from 56 to 21 per cent. Notwithstanding the development of the lathe manufacture in Japan, it is quite evident that the froeign product holds the market to a very large extent. The sudden increase of the importation was in consequence of the war. The demand in the navy and army arsenals and private factories for heavy lathes was exceedingly brisk, and the price for this machinery increased enormously. This condition of affairs gave an impetus to the importation of lathes from the United States on account of quick delivery from that country.

From this report the possibilities for increasing trade with Japan are obvious. Canadian manufacturers of certain lines have not been very keenly alive to foreign trade, and the report of Mr. Preston should encourage them to give more thought to trade expansion.

Manufactured iron and steel of all kinds will continue to be imported because the country cannot produce its own requirements. For naval and military purposes alone the importations are very large and will probably continue to increase.

Japan has only three producing iron mines and cannot supply her own requirements of iron ore and pig iron. The number of miners employed in the iron mines last year was only 477, and the amount produced was comparatively small. For the year 1908 the imports of iron and steel, pig and ingot, amounted to a little over 200,000,000 pounds, and of iron ore about 420,000,000 pounds.

THE AUTOMOBILE INDUSTRY.

A bill prohibiting the use of the automobile on certain days of the week has been presented to the Ontario Legislature. It is unfortunate that one province in Canada will not allow the use of an automobile within its boundaries and it would be a stain on the progressive spirit of Ontario, were this province to try and clog the wheels of progress by passing a law prohibiting the use of automobiles.

It is noticeable that farmers are the chief ones in the opposition to the automobile, yet it is an interesting fact that in parts of the United States the automobile has grown into such favor with the farmers that a horse is an exception. A view of a market day in one of the southern cities, showed a collection of automobiles from which framers were selling the products of the farm. Automobiles are also used as a motive power on farms, but not to a very great extent as yet.

We believe that in the possibility of any bill passing the Legislature, the farmer will be the first to ask that it be rescinded. When he realizes how he can use it for plowing, threshing, marketing, etc., he will adopt it for use on the farm.

The growth of the automobile industry has been a great stimulus to several lines of manufacture. The influence of the automobile trade is felt in the nut and bolt industry, in the manufacture of rubber hose, gas engines, packing, copper rivets, copper and brass tubing, jacks, automobile vises, open-end and other wrenches, spark plugs, dry cells, ball bearings, etc.

The advent of the automobile was responsible for great advances in the design and building of machine tools. The fine work required in the manufacture of the automobile parts and accessories made a better class of machine tools necessary and manufacturing industries, generally, have reaped the benefit. Let us not knock away the rungs of the ladder by which we have climbed.

THE FRENCH TREATY.

The French treaty will undoubtedly be of great benefit to Canada. Over 75 per cent. of the agricultural implements imported into France each year are manufactured in America. A duty of 20 per cent. is levied on this machinery, compared with 5 per cent, levied on machinery imported from European manufacturing firms.

By the French treaty Canada will enjoy the minimum tariff on a number of natural and manufactured goods, including wood, metals, grain, agricultural implements, etc. The treaty calls for a direct steamship service between the two countries. No transhipment of goods may be made, except where a country enjoys the privileges of the minimum tariff. That is, France may use the port of any third country enjoying the privileges of Canada's preferential or intermediate tariff, and Canada may tranship at the port of any third country enjoying the French minimum tariff. It is expected that the treaty will greatly stimulate the export of Canadian-made agricultural implements and finished products in iron and steel.

THE STEEL SITUATION.

The "open market" declaration of the United States Steel Corporation should do much to restore activity to the steel markets. Prices, before the decision of the steel magnates, were away too high for the dull trading conditions existing. No encouragement was being offered to business, and although the independents were shading to meet orders, they were not big enough to influence the situation. To a great extent the hands of the U. S. Steel Corporation was forced by the smaller fry, but it is also apparent that the big concerns wanted business, and saw that this was the only way to get it.

Of course, for the time being the steel markets are showing little improvement, as probable users are holding off in order to find out how low the markets will go. There has been no established price basis. Merchants are quoting on each individual order, but gradually certain prices are coming to be recognized as standard prices, and when the markets have thoroughly settled down at this level, so users will come in. There is plenty of business waiting to be attracted.

Although rumors as to drastic cutting going on have been very prevalent, it is evident that the leading interests

are not letting the markets get out of hand. This is the correct course to adopt. It was necessary for prices to be lower, but it was not necessary for the markets to be cut to pieces. Shapes, plates, bars, pipe, sheets, and tin plates have been affected, but wire products and standard rails have been left alone. So far as Canada is concerned, the steel magnates are making no concession. The cutting, they say, was for the States and not for export. The tendency, however, is for structural material to be cheaper, as importers generally will give their customers the benefits of whatever reduction they can get.

Generally building prospects will be greatly helped by the cut, and building, of course, plays a very important part in the prosperity of a country. All the way round business should be improved by the lower prices obtaining. The demand wants encouraging, and the best encouragement it can get is by a lowering of prices to suit conditions. When the finished lines become more active pig iron is bound to improve, and so the whole markets will benefit. Iron and steel are still the trade barometers, and with a rising movement in those markets, the whole metal situation would be strengthened.

USELESSNESS OF COAL DUTY.

There is a decided feeling among manufacturers that the duty on coal should be removed. In the west the United States must have British Columbia coal. During January the importations of Wellington coal into Seattle was between 10,000 and 12,000 tons. On every ton of this coal imported into United States territory duty of 67 cents a ton is paid.

"Had it not been for our heavy importations of coal from British Columbia," said Mr. Waterhouse, of Seattle, recently, "there would now be an acute fuel shortage in Seattle. We are putting out about 500 tons a day and you can see team after team leaving our bunkers while others are waiting."

The Canadian railroads alone pay over $1,000,000 each year for duty. In Ontario, where there is no coal and it must be imported, the costs of manufacturing are greatly increased by the imposing of a duty.

In Nova Scotia there is a tax on every ton of coal mined and this could probably be adjusted to help lessen the results of competition from United States coal. The removing of the duty will be of general benefit.

TELEPHONES IN INDUSTRIES.

We have noticed in several industrial establishments the telephone being used with great success between the offices of the superintendent and foremen of various departments. The use of the telephone is one of the steps in the evolution of an economical shop organization.

In the G.T.R. shops at Stratford, which are described in this issue, a telephone system is being established between all departments, stores, tool rooms, the several shops, offices, etc. The system to be followed is described in the article on the machine department. In many other Canadian shops it is used with great success and it is found that a telephone system saves the time of superintendent, foreman and mechanics.

As a time-saver the telephone is a useful instrument. Without it, forement lose time looking for foremen of other departments with whom they have business. During that time these foremen are not in their departments. The aim of shop managers should be to keep the foremen in their departments all the time and to see that mechanics lose no time getting tools, etc. This can be done by utilizing the telephone.

TOPICS OF THE MONTH.

Manufacturers should have the "open door" for travelers. As a rule, they cover a great deal of territory and are thoroughly acquainted with existing conditions in many parts of the country. Even if there are no orders for them, if manufacturers receive them courteously, they will receive valuable information that will repay them many times over for their lost time and make a friend among the traveling fraternity.

* * *

The increased Government revenue for January shows that trade is reaching normal in Canada. Figures of Canadian trade in February tell the same story. The total imports for home consumption were $23,125,380, an increase of $2,188,614, as compared with February, 1908.

* * *

Recently a doctor, a graduate of an Ontario university, was fined for practising in Ontario. The law does not prevent a graduate in medicine going into the field of engineering work, however, and it seems a poor law that does not work both ways. Placing a medical man in charge of construction, laying concrete walks, putting down drains, etc., would be like sending an engineer to prescribe for typhoid or like placing a tailor in charge of a machine shop. The man may accomplish his work well, but it is poor advertising for the graduates in science of the university that puts the graduate in medicine in charge of buildings and grounds to look after repairs and construction.

* * *

Views of the C.P.R. Angus shops, Montreal, with the men at work, were shown by moving pictures, recently. Moving pictures could be used by the railroads for training apprentices, illustrating the methods of turning, boring, etc. For instance, pictures could be given of the different operations, setting cylinders in the boring mill, arranging tools for boring, etc. There are many cases where moving pictures could be used to advantage. After illustrating the methods at one centre for a time, the films could be passed on to the next. At present the scheme would be too expensive to be used by manufacturers generally, but would be a feasible one where the views could be used at a number of centres. In a national system of technical eduction, moving pictures can be made to play a very important part.

* * *

A movement has been on foot for several years among tap and die manufacturers to eliminate the use of the old V-thread for general commercial purposes. The great advantage of the U.S. from is such that manufacturers have decided to lend their influence towards a larger use of the U.S. standard.

Such firms as Pratt & Whitney, Dundas; Canadian Tap & Die Co., Galt, are of the opinion that eventually the V-thread will be eliminated and that all threads will be governed by the United States formula. All threads may not be made according to the U.S. standard as now adopted, but they will be of the same form. The tap and die manufacturers recommend the use of the U.S thread weherever possible, believing that this type gives every satisfaction. It will be more advantageous for both manufacturers and customers if the old V-thread is discontinued in shop practice. The V-thread is harder to make and less durable. Manufacturers are general in their opinion that it would be decidedly better to eliminate the old V-thread.

In this issue is an article which fully explains the proposal to adopt a standard form of thread. This should be read with interest by mechanical men generally.

METAL MARKETS.

Although trade is not going ahead with any great rush the monthly aggregate volume of business is steadily improving. Orders keep on the light side, but on the other hand they are frequent, which makes up for the deficiency in bulk Inquiries have been very good this month, and it is evident that users are only waiting for a favorable opportunity to come more heavily into the market. Stocks are extremely low, and although this condition of affairs is all right so long as metals are easy, users are not anxious to be caught on a rapidly rising market with no stocks and a good consuming demand. So soon as the market shows signs of real stability and developing strength, so will users buy further ahead than they are doing at the present moment.

Despite good trade copper has been steadily dropping all the year, and with two cuts during the month the jobbing price is now around 14c. But for the weakness in the primary markets, it is probable that much better business would have developed but confidence in the metal has been shaken by the sagging of figures. The production of copper is going on at the same record speed, and a large amount of metal must now be held. It is certain that the pace cannot be maintained, and that if the larger producers do not stop the smaller ones must. The future of copper, unless a strong consuming call breaks in, demands such a course. Tin has been unaffected in price during the month, and remains around 31½c. Here again inquiries have been good, and a steady market would bring out a lot of business. The English market has been fluctuating owing to speculative influences, but on the whole figures have shown a firming tendency. Spelter sagged a little for one week, but soon recovered its tone, and is still marked at $5.50. Trade has been very good indeed, and with the English market in a firm state, favorable trade conditions seem likely to continue. Imported lead has weakened during the month, and is now marked at $3.65. Trade has been fair, but the English market has not been strong, and this has naturally affected the local price. Trail continues to be about 10c less.

The open market declaration by the United States Steel Corporation has caused a general readjustment of prices across the border, but it has not affected the Canadian market to any great extent. The American steel tonnage seems to have improved by the cut, but pig iron does not show signs of being greatly helped as yet. In fact, prices seem to be receding, while steel, after the first few days of cutting, is now on a much steadier basis. Canadian furnaces are reported to be still busy on fair sized orders, and are maintaining prices well. There is very little imported pig in store, and consumers will be very glad when the St. Lawrence opens.

THE A. F. A. CONVENTION.

Foundrymen and manufacturers of foundry supplies and equipment are already manifesting considerable interest in the convention which will be held in Cincinnati the week of May 17-22, and owing to the central location of the city it is estimated that the attendance will exceed that of any other meeting. It is sincerely hoped that there will be a large representation of Canadian foundrymen at this convention. President Lawrence L. Anthes, being a Canadian, should arouse a still greater interest in this convention among Canadian foundrymen.

The Cincinnati foundrymen have already organized and are making preparations for the reception and entertainment of the visitors. It has been practically decided to hold a general reception, probably at the Hotel Sinton, on Tuesday evening, which will be known as "get together night." On Thursday afternoon and evening a boat ride on the Ohio river has been planned to a Kentucky pleasure resort where a barbecue will be held.

A special meeting of the executive committee of the Foundry and Manufacturers' Supply Association was held at the Hotel Sinton, Cincinnati, for the purpose of making arrangements for the exhibit, which will be held in Music Hall. The following members were present: F. N. Perkins, president; Geo. H. Wadsworth, John Hill and E. J. Woodson, vice-presidents; J. S. McCormick, treasurer; C. E. Hoyt, secretary; Geo. R. Rayner, J. S. Smith, U. E. Kanaval and E. A. Pridmore. L. L. Anthes, president of the American Foundrymen's Association, and Dr. Richard Moldenke, secretary, met with the committee, and it was decided to charge an admission fee of 25 cents for a single attendance, and season tickets will be sold at the registration desk which will entitle visitors to attendance throughout the week at a cost of $1.

Considerable space has already been sold by the secretary, and the indications are that the number of individual exhibits will far exceed those at the Toronto convention.

The registration booth will be located in Music Hall, where the meetings of the American Foundrymen's Association, American Brass Founders' Association, and Associated Foundry Foremen will be held. The Hotel Sinton has been selected as headquarters for the members of the American Foundrymen's Association and the American Brass Founders' Assoication, while the headquarters of the Associated Foundry Foremen will be established at the Grand hotel.

DIE CASTINGS.

The H. H. Franklin Manufacturing Company of Syracuse, N.Y., has lately named the Special Machinery Manufacturing Company, Limited, of Montreal, as its sales agent for Canada in the handling of the Franklin die-castings.

The die-castings are made under pressure by a patented process. By this process the castings are turned out in a finished state. By this method it is frequently possible to cast as one piece machinery parts which if made by other methods would have to be cast in section and assembled. The process is especially adapted to the production of small, complicated parts. Every hole, slot, lug or large thread being perfectly formed at the time of casting,

The manufacturers of die-castings give a long list of mechanical contrivances in which the product is used. Some of them are: Talking machines, time recorders, soda fountain pumps, voting machines, piano players, automobile sundries, engine bearings, telephone apparatus, adding machines, vending machines and others of like sort.

Several alloys are used, the one most commonly utilized being known generally as Franklin Metal. The castings can be nickeled or brass plated, oxidized or japanned. The Franklin Metal is not intended to stand the strain when the toughness of wrought material or steel is required. Heavy work is not attempted.

Precautions to be Exercised in Treating Cast Iron*

A Paper Discussing the Properties of Cast Iron, Fracture, Shrinkage, Internal Strains, Physical Tests, Temperature of Pouring, Etc.

By SIDNEY G. SMITH

There is no branch of the art of molding that requires more care and skill than the making of cores (I do not mean plain cores), there being so many little details to watch, especially with large sand cores, that are almost inclosed in metal with very small outlets for venting. There has to be sufficient support in the cores to resist the pressure of the iron and also to be made secure in the mold with an abundance of internal ashes to relieve the generated and expanded gases until it can get clear away. If these provisions are not made a badly blown casting will be the result. The cores must be thoroughly dried, well vented, and sand refractory enough only to stand the thickness of iron that incloses them. If the sand is strong without sufficient opening material, trouble must be looked for.

Properties of Cast Iron.

Generally speaking the constituents of cast iron are as follows: Carbon in its two forms, combined, and graphite, silicon, manganese, phosphorus, sulphur, and possibly traces of other metals and metalloids. Perhaps with the exception of sulphur the other constituents are necessary for combining and uncombining the carbon, liquidizing, etc., and even sulphur may have some redeeming feature in chilled castings.

Effect of Metalloids.

The effects of the metalloids are: Combined carbon gives hardness and strength; graphitic carbon softens and toughens; silicon softens by its influence upon the carbon when that content is not in excess. It also promotes fluidity. Phosphorus also promotes fluidity, but if in excess causes brittleness. Sulphur hardens the iron, increases contraction and causes sulphur holes. Carbon and silicon are the two principal constituents that require control. The effect of different percentages of silicon in transverse and tensile strengths can be seen at a glance at Table 1 from a paper by W. G. Scott upon "Foundry Iron and Ferro-alloys."

As pure iron is useless and only exists as a curiosity, it is only in combination with other metals and metalloids that it becomes of practical use.

For many years, I think I may say for all time, we have made our mixtures by fracture, even on the pig beds where chemical analysis should commence the metal is classed generally by fracture. This method is now condemned as unreliable. But is it so unreliable?

Appearance and Analysis.

It must be admitted that competent foundrymen in the past have not gone very far astray in selecting the metal by fracture and other tests which are not chemical, and to do so with good results, a knowledge of not only the appearance of Nos. 1, 2, 3 and 4 irons is needed, but of the districts where the iron is made. These numbers, representing different grades of iron from No. 1 soft, and open-grained, to No. 4 and so on to mottled and white, should show a different analysis chiefly

Per Cent Silicon		Transverse Strength Pounds	Tensile Strength Pounds
0.20	extremely hard	2,600	20,500
0.50	very hard	2,800	24,500
1.00	hard	3,000	25,500
1.40	medium hard	3,300	26,500
1.90	medium soft	2,900	31,500
2.20	soft	2,500	30,000
2.50	very soft	2,300	29,000
3.00	extremely soft	2,000	24,500
3.50	slightly hard	1,700	22,500

Table 1.—Influence of Silicon on Transverse and Tensile Strength.

in the state of the carbons, which are influenced by the content of silicon, manganese, phosphorus, and sulphur, and these in turn are influenced by the way the furnace is working, the burden, fuel and fluxes used.

I am aware that grades can be somewhat altered in appearance, but I refer now to the ordinary way of casting on the sand pig bed, not from chill pigs, or cooling by moisture. I have yet to find an open-grained No. 1 or 2 pig that is hard iron, or a mottled or white iron that is soft.

Selection of Scrap.

In selecting scrap there may be some uncertainty unless it is known where it comes from. The writer's plan has been, first to decide what was wanted; choose the grades and scrap which will suit the work in hand, and in many cases afterwards where the work is machined follow it up. Notice how the tool takes it, and if a clean finish, go to the water test where often something may be learned, also to the test house and watch the deflection transverse and tensile strengths of the bars.

A few years of close observation plus aptitude enables a person to get the required mixture. In selecting the grades and scrap, allowance must always be made for the remelt, which will come from the cupola a little closer grained, and slightly harder than that selected, owing to the increased combined carbon which is caused by a reduced silicon and increased sulphur. If what I have said is substantially correct, I do not think it is such an impossible matter to judge and mix iron by fracture, providing it is known that the iron is suitable for any special class of work. That knowledge will only come by experience and close observation.

There is no doubt that mixing iron by analysis is the most scientific method when it is established that a given analysis will produce a mixture of iron that will be satisfactory for different classes of work. In general foundry work there are many matters to consider. A mixture of metal that would be suitable for a cylinder would be unsuitable for a large pulley, and so one may enumerate on the different kinds of work which require close and open grain, toughness and hardness, tensile and transverse strengths, also it must be remembered that different mixtures will vary in contraction, which in practice should be kept as near constant as possible.

Shrinkage and Crystallization.

Cast iron shrinks and draws during the period of solidification or crystallization. A bar 8 by 8 inches by 12 feet long will not contract so much as a bar 8 by ½ inch of the same length. There will be a difference. Why? If the two bars be broken it will be noticed that the thin bar is a closer grain than the thick one owing to the crystalline structure in quickly cooling. So quickly will the thin bar cool that the carbons will not have time to separate, hence it will show a higher combined carbon. The thick bar will take much longer to solidify. The outside of the bar will cool first and will set even when the inside is in a molten condition. That being so, as the outsides become firm

*From a paper read before the Cleveland Institution of Engineers.

and hard the due contraction is prevented from taking place on the length of the bar. The inside of the bar when broken cold will show a more open grain because the carbons have a longer time to divide. Upon close examination it is possible to find a little openness and even sponginess, owing to the crystals being attracted to the part which cools first.

Weakness in Thick Sections.

Some years ago the writer when making round-ribbed plates 9 feet in diameter in hematite iron, the web was 1 inch thick, the ribs which crossed and recrossed being rather thicker than the web. The ribs did not reach the outside diameter of the plate by some 9 inches, then tapered from that to 6 inches deep in the center, evidently all the strength was required there. What happened? From the outside diameter where the ribs did not reach were one or more cracks which went into the web some two or three inches. This was caused by the setting of the outside of the plates first, then the powerful contraction and pull coming later from the ribbed part of the plate as it cooled caused the thinner part, although set, to give way. I know it is often difficult to have uniform thickness, but it should be borne in mind that thick sections close to thin sections are often a source of weakness rather than of strength.

Iron when changing from the liquid to the solid state is said to become a mass of crystals which assume different forms regulated by the time the castings take to cool, and the temperature of the iron when poured into the mold. The lines of crystallization depend upon the direction in which the heat passes off fastest. It would be very difficult for a foundryman if he understood the law of crystallization to cause the crystals to radiate in lines that would strengthen the weak parts.

Formation of Shot Cavities.

Mr. Stead in his lecture upon iron, sulphur and phosphorus, mentioned globules of metal found in blowholes of castings with the analysis of same. I have many times seen the same thing and watched the tool jump over the places. These shot cavities are mostly found near the top of castings and seldom the bottom (I mean the top as the casting is poured). Mr. Stead explains the separation and formation of these hard shots as far as it is known.

My experience with regard to shot cavities is that they are mostly developed in iron which is rather hard. They are seldom found in a soft tough iron. The harder the iron the greater its tendency to be irritable when poured into a mold. The analysis quoted by Mr. Stead from Mr. Munnoch is as follows:

	Castings P.C.	Shot Globule P.C.
Combined carbon	0.62	2.20
Graphite carbon	2.74	Nil
Manganese	0.51	0.63
Silicon	1.63	0.70
Sulphur	0.09	0.03
Phosphorus	0.88	5.68

The analysis of the casting would indicate by no means a very hard or very soft iron, the content of phosphorus being 0.88. In the shot, that content is 5.60. What is the explanation of extra 5 per cent. nearly, of phosphorus? Silicon is down to 0.70 from 1.63, and no graphitic carbon, the total carbon being lowered from 3.36 to 2.20. This is a most important matter, and it would be a great advantage to the foundryman if the true cause of the phenomena could be discovered.

Shot cavities and hard spots in iron cause a great amount of trouble in the machine-shop, apart from unpleasant complaints to the foundry foreman.

	Light	Medium	Heavy
Silica 82.21		85.85	88.40
Alumina 9.48		8.27	6.30
Iron oxide 4.25		2.32	2.00
Lime oxide ... . ——		0.50	0.78
Lime carbonate... 0.68		0.29	——
Magnesia 0.32		0.81	0.50
Soda 0.09		0.10	——
Potash 0.05		0.03	——
Manganese ... ...——		trace	0.25

Table 2.—An American Specification for Foundry Sand.

Happily it is not of frequent occurrence. The largest of these cavities that the writer has seen would be about the size of a medium chestnut. The globule which was attached was only partly formed, about the size of a small nut, and the position of the cavity was 15 inches from the top of the casting head and about the middle of a 4-inch thickness of iron.

Soft and Hard Iron from Same Ladle.

Another phenomenon is that soft, hard, and white iron can be cast at one time from the same ladle. Mr. Cook referred to this matter in his address already quoted. He describes the varying degrees by casting a long wedge, the harder and white iron showing itself at the thin end. In the foundry, this peculiarity is an every-day observation, especially in the joint fins of castings. These fins are as white as chalk, although the iron in the thick part is soft gray. I suppose the explanation is this: when the iron is forced into a small space it rapidly sets, so rapidly that solidification has taken place before the carbons have had time to separate, and this goes to prove that graphitic carbon does not exist in metal in the molten state.

Regarding these fins, the extremities of which are quite white, and are from a soft iron mixture, there may be a query. If a sufficient quantity were gathered to make a charge for the cupola, and poured into pigs, say, 4 by 4 inches square, to what extent would the iron assume the former grain and softness? That, the original analysis would give, allowing the usual points for the remelt. In other words, will white iron after remelting remain white or under the conditions named will the iron resume in the pigs its former grain and softness? To all appearances the white iron in the fins is as brittle and hard as the ordinary furnace white iron.

Temperature.

The temperature at which a casting should be poured depends on the shape, size, thickness, the area of the runner gates, and, if a vertically cast mold, some consideration for pressure. It would be foolish in the extreme to put large gates on a mold simply to be able to rush the metal into it at a very low heat, so low it may be that the iron will scarcely leave the ladle. It would be equally foolish to put small gates on and run the iron at a white heat. It is questionable if there can be any definitely fixed temperature in general foundry work that would be of any great advantage. Somewhere between the two extremes just mentioned for runner gates and temperature would meet most classes of work. For example, a roll and a jacketed cylinder both being about the same weight may be poured in the same time, although the temperatures would be quite different. The roll which is a solid body throughout with little accumulated gases to contend with would be poured at a much lower temperature than the cylinder, and the gates are arranged accordingly. There is nothing gained by pouring the roll at a high temperature. There is a decided gain by pouring it at a low temperature, as it greatly reduces the time in feeding. In the case of the cylinder which has so many intricate cores, and from which gases generate and accumulate which must find a way of escape during the process of pouring, and which has so many corners, angles and crevices to pass, and fill, and must not fail to unite—for such the metal should be a decidedly higher temperature. What these two temperatures would be in degrees I cannot say. An experienced and observant foundryman has no great difficulty in gauging the heat of the iron to suit the work in hand. Whatever may be the difference in crystaline structure of iron

that is cast at different temperatures, the matters I have named must have first consideration.

Ferro-Alloys.

In referring to the alloys, manganese, titanium, silicon, chromium, and nickel, I wish to say their use is looked upon by some as doctoring the iron and that instead of doing that the best brands of iron should be mixed in the cupola. Granted ; but that is not the point, at least it is not my opinion. I consider the knowledge of alloys and their influence is a distinct advantage to those who have different classes of work requiring different mixtures of metal. It cannot be said that our best brands of pig could not be subject to improvement. It is continually repeated they are not so good as they used to be. If by adding ferro-alloy to the iron we can get a cleaner, stronger and more durable casting, free from honeycombs, cavities and sulphur-holes, a dense and even grain that will possess good machining qualities, iron that will give better results in physical tests, is it not experimenting in the right direction? This is apart from the fact that the alloys will often supply the element the pig may be deficient in, because the best brands of suitable iron are not always at hand.

With chrome and nickel I have had no experience, but believe such alloys are found to give great strength to motor cylinders. Manganese and titanium are closely allied in their influence ; both stiffen and render closer the iron up to 1 per cent. The advantages of steel being added to iron in the ladle and cupola need not be mentioned here, they are too well known, and are likely to be continued. I hardly need point out that care must be exercised in handling alloys.

Regarding white iron it may be interesting to note two experiments made by the late Sir Lowthian Bell.

Melting.

First experiment : A 3-foot cube mold was made and filled with white iron melted in a cupola. When broken, the edges of the fractured surfaces were white, toward the center it resembled a gray granite. The runner gate at the bottom was said to have been gray, the riser at the top was said to have been white. That was the experiment and the result. Considering that cube of iron was several tons weight the appearance of gray granite might have been expected. I have no hesitation in saying that if that block had been again remelted and poured into thickness of one and two inches the iron would have been quite white.

Second experiment : Sir Lowthian Bell wished to prove that white iron was produced when the furnace was overburdened and at a low temperature. A bar of white iron was put into the stream of slag close to the hole of a furnace running on No. 3 iron. A basin was arranged to receive the iron after its contact with the slag. When gathered and broken, it was gray iron. This iron was again remelted in a crucible to see if it would reassume the condition of white iron, but it remained gray. I think Sir Lowthian Bell proved his point that a high temperature will produce a gray iron, but I believe there is something more to be said about the white iron being converted into gray. I suggest that the white iron melted in slag containing 27 per cent. of silica would almost be sure to absorb and unite with the white iron, hence the gray iron.

Crystallization.

I wish to further add in reference to crystallization that Mallet says : "It is a law of the molecular aggregation of crystalline solids that when their particles consolidate under the influence of heat in motion, their crystals arrange and group themselves with their principal axis in lines perpendicular to the cooling or heating surfaces of the solid." E. L. Rhead in an able paper upon the same subject observes : "Since a crystal is an aggregate of small particles of the same kind, but arranged in peculiar manner, it is clear that any particle in the crystal is capable of occupying any position in the structure of which it forms a part, and that the form developed will be dependent on the peculiarities of the substance." Also, "If a fused body be cooled with sufficient rapidity no arrangement of particles can occur, and no crystals be formed." From other sources I gather that crystals in various grades of cast iron will assume different sizes and shapes.

From many years' observation of fracture and physical tests, I have come to the conclusion that with certain percentages of metalloids will come the strongest crystals. I am assuming that the crystal is formed in combination with the metalloids, and not crystals of pure iron. If the crystals were pure iron the explanation of strength might be more simple, because the metalloids only in combination would be a very weak body which would intertwine and divide the crystals. It has been proved by many tests that different percentages of metalloids give hardness, softness, toughness, transverse and tensile strength. No. 1 iron is weak and soft. White iron is hard and brittle. To strengthen the No. 1 iron we must get nearer the white, but to what point of nearness? Again, to soften and reduce the brittleness of white iron we must get nearer to No. 1 iron, but to what point of nearness? That point of nearness will be discovered when it is ascertained what percentages of the compound will produce the strongest crystals.

Analysis and Strength.

The analysis and strength of Swedish iron as given by F. M. Thomas are as follows : Special qualities of Swedish char-coal, cold blast, gray foundry pig irons have a tensile strength of 16 to 18 tons per square inch, and a transverse strength of 42 to 44 hundredweight on a 2 by 1-inch bar, 3 feet between the supports. A typical analysis would be :

Graphite carbon	2.8	per cent
Combined carbon	0.5	per cent
Silicon	0.2	per cent
Manganese	0.6	per cent
Phosphorus	0.8	per cent
Sulphur	0.03	per cent

I think this analysis is worth reflecting upon by chemists and metallurgists. If we could come within a very much lower transverse break on an average, it would be most satisfactory.

Loam Molding and Core Sand.

Chemically, various kinds of molding sand contain silica, alumina, oxide of iron, lime carbonate, lime oxide, magnesia, soda and potash. The difference between weak, medium and strong sands lies chiefly in the percentages of alumina or clay which is the binder or bond.

For light castings, for which weak sand is used, the percentage of alumina or clay must be low ; if not, the molten iron would not lie quietly in the mold, owing to the sand not being sufficiently porous, and the generated and expanded gases could not escape. Alumina or clay is practically nonporous.

For thicker and heavier castings, for which the medium sand is used, which can contain a higher percentage of alumina or clay, the irritability of the molten iron would not take place owing to the greater thickness and weight. As the castings increase in thickness and weight the sand must be more refractory and the binder stronger to resist the prolonged temperature of the iron. I may also say in neither of the qualities will the castings strip clean unless in green sand (coal dust added), and in dry sand and loam the mold is washed with blacking, of which good qualities are plumbago and blacklead.

Sand containing an excessive amount of clay will crack and shrink in baking, which is undesirable from a molding point of view.

Loam is generally understood to be either or a mixture of these different qualities of sand, being milled in a roller mill with opening and adhesive material, with water or clay wash, to make it soft or stiff consistency as may be required.

The above remarks also refer to core sand.

Table 2 is an American chemical specification for foundry sands.

Blows and Blisters.

A mold that blows is caused by confined air, and gases that are generated by the molten iron coming into contact with the sand and owing to improper provision being made, the air and gas cannot escape any other way than through the risers and runner-gates throwing the molten metal out of the mold.

A blister is often the result of a blow, especially in circular hollow castings, such as pipes that are cast horizontally. Often a blister will occur without a blow being noticed at the time of casting. The chief causes in most cases of blowing and blistering are strong sand, hard ramming, improper venting, or excess of moisture.

Discussion.

J. E. Stead : I think it must be admitted that to depend absolutely upon fracture of pig iron is not to be recommended, for as is well known No. 1 pig iron may contain anything from about 1½ to 4½ per cent. silicon. It often happens, however, that very close irons may also be very high in silicon and sulphur, and on that account the fracture is very misleading. The assistance of the analysis enables the founder to ascertain qualities which the appearance of the fracture alone does not reveal.

	(a) No. 1	(b) White
Silicon	.35	.32
Sulphur	.026	.049
Phosphorus	.02	.04
Manganese	.07	.135
Combined carbon	1.06	3.25-3.50
Graphitic carbon	2.22	
Total carbon	3.28	3.25-3.50

Table 3.—Analysis of Hematite and White Iron.

On many occasions I have been asked why No. 1 or No. 3 pig iron should give thin castings which are hard and white. The foundrymen who sent the samples to me judged entirely by fracture, but the analyses at once showed why the castings were white for they were exceedingly low in silicon and sometimes also high in manganese. Had it been known what was in the pig iron, the silicon contents could have been corrected by the addition of pig iron containing high percentages of silicon and so instead of having obtained white they would have hard gray castings.

Analyze and Inspect.

It is a mistake to assume that when recommending analysis it is to be understood that the founder is not expected to look at the fracture at all. One difficulty the founder must invariably have is to mix his iron in such proportions as to make mixtures suitable for all classes of work, but in my opinion if the melting and casting are sytematized the difficulty might, in a great measure, be overcome.

The author asks the question as to what is the reason or explanation of the 5 per cent. phosphorus in the analysis referred to by Mr. Munnoch. The globule represents approximately the eutectic of iron, phosphorus and carbon, in which some of the original cast iron is dissolved. The reason why the silicon and carbon are lower in this than they are in the normal metal is because they solidified with the first part to crystallize, leaving the residual last portion to solidify impoverished.

White and Grey Iron.

With regard to white iron and white fins I think it may be said without fear of contradiction that every kind of iron, even the very grayest, if when liquid is subdivided sufficiently and then rapidly quenched, is white in fracture when cold. Actual experiment has proved that these white particles on remelting and casting in the ordinary way give gray iron.

The author appears to think that there is some inherent difference between white and gray iron when they are in the liquid state. As a matter of fact the carbon in each case is in solution, probably as carbide or combined carbon, and by very rapid cooling of the metal it is retained in that condition. The higher the amount of silicon the more rapid must be the cooling in order to retain the carbon in the combined condition, and obtain iron with a white fracture. On the other hand many ordinary white pig irons will become gray if the period of solidification is protracted.

Test-bar Troubles.

Thos. D. Wilson : In speaking of tensile and transverse test-bars, my friend has experienced surprises in the different results obtained from bars made under uniform conditions, and getting very varying results. My experience of over forty years' foundry managing and of testing some hundreds of test-bars, is that they are a very unsatisfactory test of cast iron.

Hard Fins on Soft Castings.

Some reference is also made to the hardness of fins on soft iron castings. This is the result of the rapid abstraction of heat. You get corresponding results in all castings where chills are used or any other means of quickly abstracting the heat. I see that Mr. Smith is inclined to think that the remelting of these chilled fins would produce white iron. This has been proved in many ways not to be so, not in reference to fins but the remelting of chilled castings. Also Uehling's and other continuous pig-casting processes when the molten iron is run into chills form pigs which show a closer fracture than when remelted.

E. Adamson : It is refreshing to hear a practical foundryman asked if mixing by fracture is really unreliable. No one can deny that mixing iron by fracture has been successful in the past, and chemistry purely and simply has yet to prove itself as reliable when high-grade irons are used. It is, however, becoming more and more difficult to grade by fracture, and the competent man of 25 years ago would not be such a good man to-day because of the more numerous fractures which exist and the greater number of influences governing them. Mr. Smith has a fairly accurate impression of what governs the fracture of pig iron. I have previously given an analysis of a No. 1 West Coast hematite of Si. .35, and I have had many white irons through my hands with Si. 1.00 and over. The No. 1 iron of such low Si. could be drilled easily, but the white iron, regardless of Si. contents, could not be drilled.

Chemistry and practical experience must go hand in hand. To successfully mix iron to analysis, one of two things is necessary : (1) Having found out by practice which is the most usable irons to continue using them regardless of cost, or (2) having a knowledge of the manufacture of pig iron to know the furnace from which the iron comes and use accordingly; such knowledge, however, could not be expected of a chemist with no outside experience.

Times remelted.	G.	C.C.	Si.	P.	S.	Mn.
1	2.73	0.60	2.48	0.31	0.04	1.09
4	2.54	0.80	1.88	0.30	0.10	0.44
6	2.08	1.28	1.16	0.20	0.20	0.36

Table 4.—Composition of Remelted Iron.

Remelting and Crystallization.

With regard to certain percentages of remelts giving the strongest crystals, these will all depend upon whether the carbons are included. For example, I give two analyses in Table 3, (a) being a No. 1 hematite already mentioned, and (b) a white iron recently through my hands.

Outside of the carbons these are near enough to say they are practically the same analyses. Melt these in two crucibles side by side in the same furnace, and pour each into the same section, and it would be found that the iron (a) would still be gray, while (b) would remain white. Again use one in the place of the other for special work and the result would be absolute disaster.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shops.

The Atikokan Co. intend starting up their blast furnace at Port Arthur in the spring.

The B.C.E.R. Co.'s shops New Westminster, B.C., are very busy turning out cars for the line.

The Canadian Northern Railway are stated to be planning extensive additions to their shops in Edmonton.

The Garry Brook Co. is desirous of establishing a malleable iron foundry and machine factory at Arnprior.

Windsor civic authorities have offered a bonus to Cleveland interests to locate a gas plant machinery factory there.

The rolling mills of the Ontario Iron & Steel Co., at Welland, have been started again with a day shift of 60 men.

George H. Langwell's smelting and refining works at Montreal, were recently damaged by fire at a loss of $3,000.

New Westminster, B.C., has offered the Canadian Northern Railway a free site for the erection of shops and repair works.

The settlement of the Steel-Coal dispute is likely to bring about the establishment of the National Rolling Mills Co.'s plant in Sydney.

The scrap iron building of the Grand Trunk Rolling Mills, at Point St. Charles, was destroyed by fire recently. Loss estimated at $10,000.

A branch factory of the Robb Engineering Co., of Amherst, N.S., is to be established at Calgary, with J. F. Porter, of Winnipeg, as manager.

R. J. Wenborn, proprietor of the Nanaimo Machine Works, has moved his machinery and shop equipment into new and more commodious quarters.

An average of 80 tons of flint per day is being taken out of Richardson's mines at Bedford, all of which is being shipped to the electric smelter at Welland.

The Vancouver Pipe and Foundry Co. will erect a large foundry in the southern part of Hastings townsite, B.C. The proposed building will be 150x75 feet.

The Dominion Iron & Steel Co., Sydney, C.B., has resumed work in its rail mill after a close of some weeks. The N.T.R. is taking a great quantity of 80-lb. rails.

The Canadian Antimony Co. intend to erect a smelter and reduction plant at Lake George, N.B., and connect that place with the C.P.R. by building a 12-mile spur.

The United States Steel Corporation is again said to be contemplating locating a branch plant in Ontario, Sarnia, Port Stanley and Sandwich are looking for the industry.

The Manitoba Rolling Mills, Winnipeg, resumed operations lately after being closed down for two months. The company will erect a new building during the summer.

The Gurney Foundry have decided to make a big extension to their machine shop at West Toronto. This building will be of brick, 80x130 feet and will cost about $6,500.

Mr. Thomas, an expert, has arrived in Cobourg to superintend the building of the furnace at the new steel works there. The furnace, when completed, will cost $35,000.

The Canada Iron Corporation, Ltd., will build a new blast furnace at Midland, Ont., and has retained as engineers for the work, Frank C. Roberts & Co., of Philadelphia.

Another new industry is the Welland Stove Works, which has just been organized. Plans are ready for a factory building, and 50 hands will be employed beginning June 1.

Canada Metal Co., who have just completed a plant for special work will break ground at an early date for their brass foundry adjacent to the first building, Fraser Avenue, Toronto.

The rolling mills and horseshoe factory at Belleville, which were recently taken over by P. J. Smith and D. S. Thornton, have been running steadily since the change in ownership.

The Silliker Car Company's shops at Halifax, are working full time, and it is understood that they will shortly be compelled to put on a double shift so as to keep up with their orders.

The Amherstburg Iron Works is again running full blast with a large force of men. Messrs. Woods, the proprietors, have installed the old waterworks boiler to provide steam for their new engine.

Rhodes, Curry & Company, Amherst, N.S., are now turning out about ten box cars per day and are also at work upon passenger cars. Their men are working full hours for the first time this winter.

It is announced that the Marine and General Engineering, Sydney, C.B., which has, in common with other concerns been retarded through the financial depression, will shortly commence active operations.

The Tilbury Iron Works, owned by R. J. Clements, suffered from a bad fire recently, which caused damage to the extent of about $500. There was no insurance. A defective gas mixer was the cause.

The Butterworth foundry, Ottawa, is working overtime on rush orders for shanty heaters and shanty ranges. A bright outlook is presented for a good household range business by this firm towards spring.

The warehouse and shops of the Stuart Machinery Co., Winnipeg, were badly damaged by fire recently. The estimated damage to the building and contents is placed at $25,000 fully covered by insurance.

Indications point to a speedy commencement of work at the steel works, Cobourg. The machinery has now arrived and is being placed in position. An 80-foot crane is in operation and used in placing the machinery.

The Beach Foundry Co., Winchester, Ont., have ordered a new engine for their establishment which will be placed in position as soon as it arrives. It is expected that the foundry will resume operations in a few days.

St. Clair Bros. are moving their machinery into the new factory which they have just completed at Galt. The machine shop is of concrete construction, 50x100 feet. The forging shop is connected with the machine shop and is much larger than the one formerly occupied by the company.

Goldie & McCulloch Company, Galt, is suing the town of Uxbridge. The firm claims possession of machinery valued at $2,600, furnished by them to Palmer Piano Company. The town is mortgagee of the piano company, which assigned last September.

The Grand Trunk Railway has received an order from the Montreal and Southern Counties Railway for six electric cars to be built in the G.T.R. shops at Point St. Charles, and delivered in sixty days. The cars are wanted for service on Victoria bridge.

Announcement has been made that the Page-Hersey Co., has let the contract to the Berlin Construction Co., Berlin, Conn., for the erection of large mills at Welland for the manufacture of all sizes of water and gas pipe. The work of construction will begin at Welland at an early date.

Improvements to the Winnipeg shops are planned by the Canadian Northern, and on the arrival of spring, work will commence on several additions to the works at Fort Rouge. A carpenter shop, costing $25,000, will be erected and smaller additions to the present buildings will also be made.

A new industry known as the Welland Tin Plate & Sheet Company, is being promoted. A two-mill plant, tin plate, polished sheet, tern plate, Canada plate, and steel sheet of every description, will be manufactured. The plant will have a capacity to manufacture 100,000 boxes or 5,000 tons.

The brass foundry of William Keating, 237 Landsdowne, Ave., Toronto, was destroyed by fire recently, loss $15,000. The loss is principally to the stock of brass goods, plumbers' supplies, etc., which was a large one, and to the machinery. The stock is valued by Mr. Keating at $7,000 and the machinery at about $8,000.

It is understood that the Collingwood Shipbuilding Company has given up the idea of leasing the government dry dock at Kingston and establishing a repair shop in connection therewith. There is a possibility, however, that the Kingston Locomotive Works Company may secure the dock and establish necessary shops.

The Manitoba Iron Works are planning an addition to their buildings at Winnipeg, at an initial cost of over $150,000. T. R. Deacon, manager of the company, states that when the addition is completed the capacity of the work will be at least 20,000 tons of steel a year, enabling the construction of the largest bridge spans required.

A big manufacturing plant for the purpose of turning out locomotives and lumber and logging engines will probably locate in Vancouver within a short time, if plans now under way are completed. Seattle capitalists have had representatives there for several days, who are perfecting an option on ten acres of ground in the East End, on which to erect buildings and install the necessary machinery.

The Canadian Webber Engine Co., with a capitalization of $300,000, having all the patent rights of the American Webber Engine Co., of Kansas City, and employing a minimum of 100 hands will open up the old Dyment foundry at Barrie and manufacture gas producers and gas engines. Their output will be sold throughout the whole Dominion. Mr. Dyment will be one of the largest shareholders and president of the company.

F. L. Leighton, managing director of the Vancouver Engineering Works, saying that by June 1, his company will be manufacturing steel castings, the first to be made in Canada west of the great lakes. The plant for doing this work will cost $100,000. What is known as the converter process of making steel castings will be installed. Electric cranes will be used, in all the operations and this department will be carried on by electricity. The plant will be of the most modern deecription.

Somerville Limited, Toronto, who have recently completed one of the finest and most perfectly equipped brass plants on the continent, are already finding it too small to meet the requirements of their rapidly growing business, and have taken out a building permit for a large extension to their foundry. They are also extending and refitting their show rooms and offices on Richmond street, where the company will greatly add to their already extensive display of plumbing fixtures and appliances.

A meeting of the creditors of the Reid Foundry and Machine Company, Ingersoll, was held a few days ago. It will be remembered that this company assigned for the benefit of its creditors recently. At the meeting about seventy-five were present, snd, after hearing the report of the assignee, Walter Mills and W. F. Johnston, Ingersoll, and Mr. Marshall, of Hamilton, were appointed inspectors. A proposition was advanced for the reorganization of the company, and it is expected that operations will be resumed at the plant in a very short time.

A new iron industry is to be started in Toronto shortly, though under what name it will operate is not as yet known. At a recent meeting of the Board of Control the statement was made that the company, which has been formed had secured options on some factory sites, and the company's representatives stated their intention of building immediately, and asked that they be allowed to build branch lines connecting their buildings with the Canadian Pacific and the Grand Trunk. As the company was already preparing to build the board granted the request.

The Huntsville Engine Works Co. which has been running for a year past under a partnership arrangement, has been changed into a joint stock company. The President and General Manager is John Youngson who has been the principal owner under the former partnership. John Whiteside is Vice-President, and G. F. Elliot, who came recently from Hamilton, is Secretary-Treasurer. The directors are Messrs. Youngson, Hutchison and Readman, the latter two being the chief associates with Mr. Youngson since the present business was established.

A smelter is to be built near Nanaimo, B.C., to treat tin and other ores. The smelter is to be built by the Pacific Tin Mining & Smelting Company, a Canadian concern, which was incorporated Jan. 14, 1909. The company proposes to commence operations at once. The company has secured the services of a Swansea engineer to superintend the new smelter, Mr. F. M. Perkins, a metallurgical engineer, formerly of the Magdalena smelter of Mexico, and also of the Mexican Smelting & Refining Company. Mr. Perkins is to be managing director of the new concern.

A number of London men have, it is understood, formed a company to establish machine

works in the east end of that city and their plans will be made public shortly. A site has been selected along the G.T.R., and when the concern is started in operation it will give employment to a goodly number of hands. The promoters will, of course, expect to share in the city council's proposition to lay aside $100,000 for the purchase of free sites for manufactories, provided that proposition gets the approval of the Legislature, which, in view of the strong opposition which has developed, is none too certain.

Fire recently destroyed the works of the new Burrell-Johnson Iron Company at Yarmouth, N.S. The fire started in the oil room, which was situated near the machine shop. The fire also damaged the four-storey stone warehouse and other buildings on the wharf, filled with finished stoves and costly patterns of machinery, etc. The buildings entirely destroyed were the machine shop, engine and boiler house, stove-fitting shop, pattern shop, draughting rooms and offices. The boiler shop across the street was badly damaged, as was also the brick foundry adjoining to the north. In the machine shop was a large quantity of machinery ready for delivery, all of which was destroyed. By the loss of the patterns the company will be greatly handicapped in completing their contracts. As a result of the fire 150 men are thrown out of employment, and nearly all of them lost their effects. The property loss is estimated at $125,000, on which there was only $10,000 insurance.

The rail mill of the Dominion Iron and Steel plant at Sydney is turning out at present an 85 pound rail order for the C.P.R. During the past two months an exceptionally high average in the quality of steel manufactured by the plant has been maintained, 98 per cent. of the finished material being passed by the inspectors. This record is said to be unequalled in any of the big plants across the border. Repair men are at work in the different departments of the plant getting the machinery in first-class condition for the big rush that is expected this summer. The staff at the plant is being increased as rapidly as possible and in a short time the force will have reached its full complement. Following the meeting of the Steel directors in Montreal, a boom is expected in construction at the plant. About two years ago foundations were put in for an extra battery of coke ovens and it is practically certain that construction work will commence on the ovens as soon as the weather conditions will permit. To "put in" a battery of coke ovens will require the services of upwards eight hundred men, the majority of whom must be skilled men, and it will consume practically all the summer before the work is finished. Other additions are also spoken of in connection with the works.

Municipal Undertakings.

A new main sewer will be constructed at Sarnia.

A waterworks system will be construsted at Burlington.

Montreal is considering establishing a filtration plant.

Exeter, Ont., is thinking of constructing a waterworks system.

Hamilton is buying land for its west end sewage disposal works.

Winnipeg's proposed new sewerage system is estimated to cost $7,000,000.

Wetaskiwin, Alta., will instal a waterworks and sewerage system this year.

Tenders are asked for supplies of cement and sewer pipe required by Brantford for 1909.

Kingston may extend its waterworks mains to all parts of the city, at a cost of $35,000.

Sydney, C.B., will spend over $90,000 in sewers, water extension, bridges, fire station, etc.

Peterboro's water commissioners advocate installing a new waterworks plant, to cost $120,000.

A by-law will be submitted shortly to the ratepayers of Thorold to raise $15,000 for waterworks.

Verdun's $50,000 water supply system is being rapidly pushed and is expected to be finished by June.

Fort Erie ratepayers will vote on a by-law to authorize the raising of $50,000 for waterworks purposes.

Estevan, Sask., ratepayers will probably vote on a by-law to raise $30,000 for fire protection purposes.

Meaford ratepayers have passed a by-law authorizing the instalation of a waterworks filtering basin.

Point Grey, a suburb of Vancouver, will have to be drained by trunk sewers running through Vancouver.

Simcoe, Ont., ratepayers have passed a by-law authorizing the instalation of a waterworks system.

The Hamilton sewers committee will procure more land for the proposed west end sewage disposal works.

A by-law will probably be submitted to the Pembroke, Ont., ratepayers to spend about $125,000 for a water system.

The Roberts Filtration Co., of Philadelphia, Pa., has been awarded the contract for the instalation of a filtration plant at Edmonton, at cost of $16,500.

The Gartshore-Thomson Company received the contract for supplying the iron castings required by the Hamilton sewers department, at $1.95 a hundred pounds.

A. Mercer, Hamilton, was given the contract at $2,165 of laying an iron pipe down the side of the mountain at Hamilton to connect the mountain and city sewer systems.

Tenders are asked for materials for Saskatoon's waterworks and sewerage works as follows: Cast iron pipe and specials, 280 tons; fire hydrants, gate valves, etc.; sewer pipe, 20,000 feet; pumping machines.

Dominion, C.B., ratepayers authorized the town council to borrow $20,000 for the instalation of a permanent water supply. The water will be supplied by the town of Glace Bay from their standpipe at Cadegan's brook.

Mr. Barlow, Montreal's city surveyor, stands firmly by the recommendations he has made to the Road Committee in regard to the placing of orders for the machinery needed for the department's new shops at Point St. Charles.

The general scheme for the reorganization of the civic light and power department, at Kamloops, which has been laid before the city council, involves an expenditure of $16,500. This includes the purchase of a compound direct engine, with a capacity of 150 h.p., costing $9,000; a 120 k.w. dynamo, indirect, $3,200; 150 h.p. boiler at $2,100, new wiring, $2,200, and contingencies, $1,000. This equipment will provide abundance of power.

Railway Construction.

An electric railway is proposed to be built from Medicine Hat to Calgary.

The Canadian Pacific Railway will construct a branch line from St. Mary's to Stratford. The distance is 23 miles.

The Peterborough Radial Railway Company contemplates extending its line from Clear Lake to a point in Stony Lake in Peterborough County.

The Niagara Peninsular Railway Co. will apply for permission to build a branch line of electric railway from Port Colborne through Welland.

In addition to the Weyburn line, which the C.P.R. will construct this season, the company will lay a line from Lethbridge to connect the Macleod branch with the Calgary and Edmonton line, a little north of High River station.

The Flathead Railway Bill has been reported favorably to the B.C. House and there is every prospect of its being passed. The proposed route of the new line is from a point on the eastern British Columbia railway at or near the Town of Corbin, to the international boundary line, a distance of nearly fifty miles.

The Victoria & Barkley Sound Railway intend to build from Victoria to a point on Barkley Sound, in the neighborhood of Sarita river, by way of Otter Point and San Juan, with branch lines not exceeding twelve miles in length from any points on the main line to points adjacent to it.

The New York Central Railroad will this year buy 101,000 tons of steel rails. The Algoma Steel Co., Sault Ste. Marie, Ont., will supply 5,400 tons, presumably for betterment use on the Michigan Central road in Ontario, especially in connection with the tunnel under the Detroit River at Windsor.

The C.P.R.'s program of railway construction this year east of Fort William will include a branch line from Coldwater Junction to Peterboro, which will be part of the scheme for a short rail route between Montreal and Georgian Bay ports. It is anticipated also that during the coming season forty additional miles will be added to the double tracking of the C.P.R. between Toronto and Montreal.

The C.P.R. is preparing plans for improvements to its property at Sherbrooke, which will entail an expenditure of close on $100,000. They some time ago purchased a property close to their present terminus there, for which they paid $29,500. It is the intention of the company to build a handsome new station on this property, and to turn the present station over for use as a freight shed. In addition to this a new roundhouse will be built, and the shops and sheds increased.

Electrical Notes.

The United Heat, Light and Power Co., Goderich, has obtained a charter.

The British Columbia Telephone Company will install a system at Cumberland.

The Maple Leaf Milling Co., Brandon, may put in an entirely new power plant.

The Canada Automatic Machine Telephone Co., will be operating in Brantford by May 1.

The Brandon Board of Trade suggests getting power for manufacturing purposes from Winnipeg.

Shelburne, Ont., is now illuminated by electric light, the power being supplied from Horning's Mills.

Portage la Prairie council has approved the plan for a power and lighting plant and a by-law will be introduced.

Grimsby, Ont., is about to take over the electric lighting system from the company which has heretofore operated it.

Beamsville, Ont., is about to take over the electric lighting system from the company which has operated it heretofore.

A by-law to issue $10,000 debentures for an electric light plant will be at once submitted to the ratepayers of Listowel.

The Manitoba Legislature will vote upon the matter of expending $25,000 for a new telephone building at Portage la Prairie.

The Kentville, N.S., Electric Light & Power Co., will install another small generator in their lighting plant in the future.

Vancouver's city electrician has completed specifications upon which tenders will shortly be called for a police signal-patrol system.

It is understood that the Hydro-Electric engineers have placed the requirements of Windsor Walkerville and Sandwich at 2,500 horse-power.

Tenders for Toronto's municipal electrical distribution plant have been advertised in a number of Canadian and United States technical journals.

The work of putting in a new unit of ten thousand horse power at the Vancouver power house of the B.C. Electric Railway Company is progressing.

A by-law granting a franchise to F. Laidlev for the installation of an electric light and gas plant at Swift Current, Sask., has received its second reading.

The Acadia Telephone Co., Moncton, N.B., are applying for incorporation to construct and operate a telephone system in Kent and Northumberland counties.

J. R. Booth is building a power house at the Chaudiere, on the site of the first sawmill burned there fifty years ago. This building is also for a boxwood factory.

Montreal will fight the electric supply companies for the control of the streets, by obtaining legislation prohibiting corporations erecting poles without permission.

Peterboro' city council has granted the Peterboro Radial Ry. Co. an extension of time to build the electric railway's extensions in that city. The plans entail an outlay of $400,000.

Electrical Engineer Aitken stated recently that the specifications for the municipal electrical distribution plant were finished on Saturday, and forwarded to Alexander Dow, Detroit, the consulting engineer.

The by-law to raise $15,000 for the purpose of completing the expenditure undertaken in the construction of the Hydro-Electric power plant at South Falls, has been approved by the ratepayers of Gravenhurst.

Application will be made for the incorporation of the Kapitchouan Railway Company, for the construction of an electric railway from Lake Kapitchouan to Montreal with branch lines of about twelve miles in length.

The Saskatoon Electric Supply Co., are preparing for what promises to be the busiest year in the history of this enterprising and progressive firm, by installing a very heavy stock of new goods, notably dynamos and motors.

Two carloads of plant, consisting of engines, boilers, steam drills, derricks and other machinery, have arrived at Grand Falls, N.B., and are now being set up for the beginning of the operations of the Grand Falls Power Company.

The Grand Falls Power Co., Grand Falls, N.B., have let the contract for the first unit in an 80,000 h.p. hydro-electric plant. The first unit is to be a 800 k.w. generator, the contract being secured by Kilmer, Pullen & Burnham, Toronto.

Engineer Sifton, London, says that city should erect its own plant. It would cost not more than $235,000. He has also stated he could duplicate the London Electric Plant for $275,000, for which the company ask $501,000.

Kamloops, B.C., will have an improved lighting service in the course of two or three

months and the expense involved in the improvements to the present plant will be about $7,000. It is hoped then to have twice as much power as was had during the winter.

J. S. Armstrong, Rothesay, N.B., has given notice that a bill will be introduced at the approaching session of the N.B. Legislature to incorporate the St. John Power Company with power to carry on a general lighting, heating and power business in any part of New Brunswick.

The electric lighting plant of the Provincial Hospital, at St. John, practically destroyed by a recent fire, has been entirely rebuilt by the Vaughan Electric Company and is now about in running order again. The job has been one of the largest ever undertaken by a St. John electrical firm.

The Calgary Power & Transmission Company have engaged Cecil B. Smith, consulting engineer, Toronto, to report on their power proposition at Horseshoe Falls on the Bow. Mr. Smith states that this fall alone will produce at least 8,000 horse power.

Tenders will be taken shortly by Smith, Kerry & Chace, Toronto, for the construction at Orangeville of the power house for the Dufferin Light & Power Company. The power house will contain three 150 k.w. hydraulic units with step-transformers to a transmission voltage of 22,000 volts.

The general scheme for the reorganization of the Kamloops civic light and power department involves an expenditure of $16,500. This includes the purchase of a compound direct engine with a capacity of 150 K.W., costing $9,000, a 120 K.W. dynamo indirect $3,200, 150 h.p. boiler at $2,100, new wiring $2,200, contingencies $1,000.

The Toronto Board of Control of Toronto passed the specifications and forms of tender for three-core cable for the city's electric power distribution plant. The specifications for the plant and engines will be ready in six weeks, and it is hoped to start work on the underground construction in a few weeks' time.

J. C. Kennedy, engineer-in-charge of the Slave Lake Power Co., Vancouver, recently visited Okanagan for the purpose of going over the site of the Coteau Power Co., and to verify the plans of their engineer, A. E. Ashcroft, with whom he agrees that arrangements may safely be made for the development of 5,000 horse-power required to operate a system of tramways in this district.

The Montreal Electric Light Company are proceeding with the erection of their distribution system in the city of Montreal and for immediate needs have closed a contract with the Saraguay Electric & Water Company for the supply of power in bulk. They expect to start construction work early in the spring on a 10,000 h.p. steam plant. This steam plant will ultimately be used as a reserve for their water powers when developed.

With the intention of harnessing the water power of Eel River, near the boundary of York and Carleton counties on the St. John river, N.B., George P. Olts, of Meductic, has applied to the N.B. Legislature for the incorporation of the Meductic-Eel River Electrical Power Company. The company's object is to erect and maintain a dam across Eel River, near the highway bridge, to generate electric current there and supply power and light to the neighboring country.

Contracts have been awarded by the Street Railway Company, as follows: Federal Electric Company, Montreal, Que., aluminium, contract price $4,500. The nearest competitor was the Northwest Electric Company, of Edmonton, whose price was $50 lower. The Northwest Electric Company will furnish the overhead specials for $1,947.90. Wm. Stuart & Company will supply the wooden poles needed for $3,400. Copper bonds will be supplied by the Canadian General Electric Company, Peterborough, Ont., for $5,050.

The bill to incorporate the Eastern Ontario County Electric Belt Line Company, capitalized at $1,000,000, is now before the Ontario Provincial Government. The company proposes to built an electric line from Lancaster township, running along the St. Lawrence to Cornwall, thence to Brockville, thence northwesterly through to Dundas and Lanark to Darling township, passing through Athens, Lanark, Perth, and connecting with the Lanark Counties Electric Railway Company, and from Morrisburg through Dundas, Russell and Carleton.

Tenders will be received up to Thursday, April 15th, 1909, for the manufacture and delivery at Winnipeg of two testing transformers, viz.: One 30 k.w. at 80,000 volts and one 200 k.w. at 200,000 volts, also for control equipment therefor. Copies of the instructions to bidders, specifications and forms of tender may be obtained at the power engineer's office, Carnegie Library building, Winnipeg, Manitoba. These specifications may also be seen at the office of Smith, Kerry & Chace, Confederation Life Building, Toronto, Ontario. M. Peterson, secretary, office of the Board of Control, Winnipeg, Man.

City Engineer Bell has completed all the plans for St. Thomas ordered to be prepared by Chief Engineer Sotham, of the Hydro Electric Commission. There are six plans altogether. One shows the grounds and location of the L. H. & P. plant on a small scale; another the engine room on a larger scale; a third, the city lighting circuit, showing all arc lights and gas lamps; fourth, the power circuit, with all users and amount of horse power; fifth, the incandescent or alternating light circuit, amount used and size of transformers; sixth, the telegraph and telephone line, also the street railway line.

The style of tower to be used for carrying the Hydro-Electric high tension cable from Niagara Falls to the various transmission stations has been finally approved and the actual work of construction will be pushed forward with all speed. Recently a test was made of two styles of tower, one designed by the engineers of the Hydro-Electric Commission and the other designed by Cecil B. Smith for the McGuigan Construction Company. The Commission's tower gave best satisfaction and it was selected as the standard tower for use on the transmission line. Apart from some small difference in the character of the wire-carrying arms the principal advantage the tower selected has over the McGuigan tower is in the fact that the supports are constructed in such a way that a farmer can drive a loaded wagon between them while in the McGuigan tower the cross supports prevent this.

In a recent statement Frederic Nicholls, of the Canadian General Electric Co., Peterborough, is quoted as follows: "This company has secured more new business during the past two months than during the preceding six months, and we have more enquiries on our books than we have had since 1906, and are, therefore, looking to the future with confidence." This is of special interest to Peterborough, their shops there having suffered with other industries from the conditions of the past year. The company secured the contract let by the Hydro-Electric Commission for the equipment of twelve stations on the transmission line. The commencement of this work will mean a renewal of the activities of the works.

Brantford city council has adopted a by-law ratifying the agreement with the Western Counties Power Company now operating here as a subsidiary of the Cataract Power Company. This company in 1906 was given a 25-years' franchise for commercial and domestic lighting at a maxsimum rate of nine cents per kilowatt. Its street lighting contract with the city, however, at a rate of $55 per year, expired last September, and has continued until the present without any specific agreement. Under the new agreement the company gets a five years' contract for street lighting, charging the city $48 per light per year for street lighting, and in addition agrees to reduce its rates to 7.65 cents per kilowatt for commercial and domestic lighting. On street lighting this is a saving of $8,750. The rates for commercial and domestic lighting are reduced 7 per cent., which will mean a taving to the citizens of $2,100 per year, or $10,500 in five years, making a total saving in street and private lighting of $19,250 in five years. While the contract is for five years only the city can renew it for 10, 15 and 20 years, on the present terms or better rates if conditions will permit at the end of five year periods. As a further safeguard the agreement calls for the company to furnish Brantford with light and power for all purposes 10 per cent. cheaper than the price received by any municipality using Hydro-Electric commission power, due allowance being made for the differences in the distance of transmission, and provided also that such municipalities are not getting rates below cost. This means that rates are 10 per cent. better than the Hydro Electric Commission could do here.

Structural Steel Notes.

The estimated total cost of the proposed Holland river bridge is $15,400.

Plans have been prepared for the new Smith street bridge, Peterboro. It will cost $28,000.

The Petrolea, Ont., council have passed a by-law to erect a bridge at Black Creek at a cost of $5,500.

The residents of Ottawa South will present a petition for the construction of a new bridge at Bank street.

There is a movement on foot at Kingston for the construction of a subway under the tracks of the Grand Trunk Railway.

The enlargement of the Saskatchewan bridge at Edmonton, will be brought before the Dominion Government this session.

It is estimated that $100,000 will be spent in repairing bridges throughout New Brunswick which were damaged by the recent freshet.

It is expected that a steel bridge will be erected next fall, at Lindsay, to take the place of the present Wellington street structure.

The C.P.R. intend to construct a 3,000-ft. bridge over the South Saskatchewan River for an extension of their Moose Jaw-Lacombe line.

The Windsor Board of Works are negotiating with the Michigan Central Railroad for the construction of a new bridge over their tracks in that city.

The construction of the $600,000 steel bridge at New Westminster, to replace the present frame bridge across the north arm to Lulu Island, has been begun.

A deputation from the Ottawa city council waited upon the Hon G. P. Graham to ask for an appropriation for a bridge over the canal at Mutchmor street.

The Western Bridge & Equipment Co., Chatham, has received the contract for a new steel bridge in Harwich township, the materials going forward to-day.

Engineer Kelly, of the G.T.R., was recently in London, and stated that plans are under way for the erection of a new station and for considerable improvement.

The Alberta Provincial Government are completing this spring a new steel bridge of two spans with three cement piers, over the Red Deer river ar Red Deer town.

The William P. McNeill Co. will add to their crew of employes, and the erection of the steel for the new spans of the Fredericton Highway Bridge will be proceeded with rapidly.

The Hunter Bridge & Boiler Company have been awarded by the Bruce County Council the contract for the construction of the Stirton bridge at $13,300 for complete bridge, steel and cement work.

Plans are being prepared at the N.B. Provincial Public Works Department for new steel bridges at Chipman, Queen's County, Fredericton Junction, Sunbury county and Buctouche, Kent county.

The estimates recently presented to the Sydney, C.B., City Council include items of $3,500 for a new bridge at Wentworth Creek and Bentinck street, and $8,000 for a new bridge at Whitney avenue.

The Provincial Government of Alberta will this summer start a new steel bridge crossing Red Deer river, some eight miles due east of Red Deer town at the crossing locally known as Brenner's or Ericson's.

The Saugeen Council let the contract for the erection of Stewart's Bridge, near Port Elgin. The steel work will be done by the Hunter Bridge and Boiler Company, Kincardine, the contract price being $1,500.

In answer to a question by R. L. Borden, the Minister of Railways & Canals, stated that it was expected that plans and specifications for the rebuilding of the Quebec bridge would be completed this year and tenders taken.

Plans for the proposed new Prairie Siding bridge have been made by Engineer Jas. A. Pell, St. Thomas. The plans call for a bridge of 200 foot swing, and the cost is estimated at $31,551 for a bridge with concrete approaches and plank floor on the swing.

It was stated at the head offices of the Grand Trunk Pacific Railway Company that the company was willing to undertake the building of the Quebec Bridge, and that it would agree to complete the structure to the general satisfaction within the period of three years.

Notice is given at Ottawa that tenders will be receive at the office of the commissioners of the Transcontinental railway, until April 8, for the construction and erection of a steel and concrete bridge, and approach spans over the Red river, between Winnipeg and St. Boniface.

The Montreal city authorities are preparing to make a big fight against the demand of the Canadian Pacific Railway that a new iron bridge should be constructed to replace the present wooden structure which crosses the railway tracks on St. Catherine street east.

The Canadian Bridge Works, Walkerville, have been awarded the government contract for the construction of 3,000 steel towers in connection with the Ontario hydro-electric commission's plan for bringing Niagara power to Windsor over government owned cables. A public test of one of the towers was given in the yards of the works. The tower, which is 65 feet in height bore all the strains put upon it

Planing Mill News.

Odleifson & Thornsteinson have started a saw mill at Gimli.

A sawmill will be erected at Sturgeon Falls, Ont., by Oscar Rusk.

The Albion Brick Co., Vancouver, will build a saw and planing mill.

A joint stock company will erect a veneer mill at Mansonville, Que.

The Carnegie Milling Company are erecting a sawmill at Port Perry, Ont.

The Dawson Lumber Company's mills at Yarmouth, N.S., have resumed operations.

C. Jobin & Company, St. Augustine, Que., have been incorporated to operate sawmills.

A shingle mill will be built at Esquimalt, by H. Bacus, Seattle, who has already selected the site.

J. S. Emerson, Vancouver, is building a planing mill and sawmill at Eburne, on the Fraser River.

An addition will be built to the Arrowhead lumber mills at Kamloops, B.C., at a cost of $20,000.

The Davidson-Ward Lumber Co., are erecting a 20-machine shingle mill at Loughborough Inlet, B.C.

Alex. Kippen, proprietor of the Perth planing mill, started the plant running again a few days ago.

The saw mills at St. Croix, Que., owned by C. Auger were recently destroyed by fire at a loss of $10,000.

C. A. McGillivray, Bellingham, Wash., has purchased a site at Vancouver, for the erection of a large sawmill.

The Michigan Pacific Lumber Co. are stated to be planning the erection of a large mill at Harriston, 30 miles east of Vancouver.

George Othmer & Sons, West Derry, are building a new sawmill at Buckingham, Que., to replace the one destroyed by fire a year ago.

Flewin & Sons, Vancouver, have been incorporated with a capital stock of $50,000 to erect and operate sawmills, build steamboats and barges, etc.

The Powell Lumber and Door Co., capitalized at $50,000, has been granted a charter to take over the lumber business of the Rathbun Co., in Toronto.

All the machinery is on the ground for the new lumber mill of the Fischer Lumber Co., on the line of the Transcontinental Railway near Good Lake, Ont.

The Edinboro' Timber Co., Vancouver, capital $200,000, has been granted a British Columbia charter to manufacture lumber, run sawmills, make sashes and doors.

The Converce & Brown Shingle Co. have completed arrangements for the construction and operation of a shingle mill at Bazan Bay, just south of Sydney, B.C.

Pennsylvania and Chicago capitalists have been inspecting 117 square miles of timber on Moresby Island, B.C., owned by Wallace, McMillan & Murray, Queen Charlotte. A sawmill will be erected.

The Canadian Pacific Sulphite Pulp Company, which have a mill at Swanson Bay, have been awarded the contract by the B.C. Provincial Government for $3,500,000 feet of spruce lumber, which will be used for street improvements.

One hundred and forty thousand acres of timber land were disposed of last month by an English syndicate to Vancouver capitalists for a figure in the vicinity of $800,000. The plans are for the erection of pulpwood and sawmills on the property situated on the east coast of Vancouver Island, one hundred miles north of Vancouver.

The old sawmill which has been running at Whitechurch in the county of Bruce since 1881 has just been purchased by a man in Calgary, and is now being shipped away to the West. Where there were formerly a large number of sawmills in operation in the counties of Huron and Bruce there are now scarcely any, and many express the opinion that woodworking factories will have to follow in their wake.

H. J. Crowe, president of the Newfoundland Pine & Pulp Company, says that a big publishing house in London has already expended $5,000,000 in the purchase of timber lands and the erecting of pulp mills in Newfoundland. The Reed English paper manufacturing concern has expended almost an equal amount. A large mill has been erected at Point Leamington, which has already turned out over 2,000,000 feet of lumber. The Badger mill has also turned out over 1,000,000 feet of good pine.

Building Operations.

The C.P.R. will build a grain elevator at Vancouver.

C. A. Ahrens will build a new and larger shoe factory at Berlin.

The Tent and Mattress Co., Saskatoon, are putting up a new warehouse.

The B.C. Soap Works, Victoria, contemplate large additions to their factory.

The Gerhard Heintzman Piano Co. are erecting a six-storey warehouse at Toronto.

A new pulp mill will be erected at East Angus, Que., in the spring at a cost of $250,000.

The Copp-Clark Company have bought a site in Toronto and will build a new warehouse and bindery.

Bentley & Marsh, makers of sporting goods, Niagara Falls, are erecting a new and larger factory.

The Toronto Show Case Company are preparing plans for the erection of a large factory in that city.

The Canada Cycle & Motor Company will erect a 4-storey building at Toronto, at a cost of about $50,000.

Construction will shortly commence upon a large new factory for the Oxford Knitting Co., at Woodstock, Ont.

The Canadian Industrial Company, Vancouver, will erect a large paper and pulp mill at a site on the Powell river.

The Vancouver Milling & Grain Co., are rebuilding the mill recently burned at Vancouver. The new mill will cost $40,000.

Pratt & Lambert, varnish manufacturers, Buffalo, have purchased a site at Bridgeburg, Ont., where they will build a Canadian factory this summer.

R. Bowman is getting out plans for a new concrete warehouse at Victoria, which will cost $30,000. It will be five storeys in height, with electric elevators.

Samuel Brown, Winnipeg, has been awarded the contract for the erection of the new freight sheds for the C.N.R. at Saskatoon. Approximate cost, $20,000.

J. H. Griffin, general inspector and traffic agent of the Great Northern Railway, states that an elevator will be erected in Brandon early next season.

The Victoria Creamery Co. are about to take out at Victoria, a permit for their new building on Broad St., which, with machinery and land, will amount to $35,000.

The American Column Co., Battle Creek, Mich., will build a one-storey factory building at Niagara Falls for their Canadian business. The cost is estimated at $25,000.

An additional $50,000 will be required to complete the Calgary city hall. The extra amount will be used for the raising of a tower, installing an elevator, and equipping a laboratory.

Weatherstone & Sons, manufacturers of door mats, etc., Brantford, have completed the foundation for a new factory, which was found necessary owing to their business having outgrown the present premises.

The trustees of the Toronto General Hospital are considering the appointment of an expert to pass upon the plans for the new hospital. The plans submitted call for expenditures respectively of $1,350,000 and $1,210,000.

Henry Disston & Sons, saw makers, Philadelphia and Toronto, have bought for $50,000 a four-acre block of land in Toronto, on which they will erect a new $80,000 factory in the spring, to employ 300 or 400 men.

The Canada Chemical & Wood Distilling Company, Chilliwack, B.C., capitalized at $20,000, are applying for incorporation. Arrangements are now being made for the erection of a building and the installation of machinery.

The Western Canada Wood Pulp & Paper Co. are said to have acquired the entire pulp limits, foreshore rights and water privileges from the Quatsino Power & Pulp Co., and will at once erect a large mill on Marble Bay, Quatsino Sound, B.C.

Forty-three new elevators will be built in Alberta, during the current year. The Alberta Pacific Elevator Co. will build twenty-five, the Alberta Grain and Elevator Company, eight, and private firms ten. The majority will be in the southern part of the province, although a few are as far north as Strathcona.

Among the buildings to go up this year in Toronto are a new fire hall and police station at East Toronto; fire hall on Perth Avenue, and an addition to the main pumping station. Then there is the General Hospital and the additions to Western and Isolation hospitals, some university buildings, and a technical school, several warehouses and many dwellings.

The Frost Wire Fence Company, Hamilton, will make an important addition to its plant within the near future. The firm is going into the manufacture of its own wire and will erect a wire mill for that purpose. The proposed new building will cover about an acre of ground and with equipment will cost in the neighborhood of $50,000.

General Manufacturing News.

The B.C. Soap and Paint Works, Victoria, are contemplating putting an addition to their factory.

A $35,000 hydraulic placer plant will be erected on Ruby Creek, Atlin County, B.C., by Boston and Seattle interests.

The Heaton Acetylene Co., Ltd., formerly of Hampton, N.B., manufacturers of acetylene generators, have located in Amherst.

Robertson Brothers, Toronto, candy manufacturers, will erect a five-storey addition to their factory and boiler house, at a cost of $40,000.

The plant of the Canadian Asbestos Co., Lachine, Que., was destroyed by fire recently. Estimated loss, $40,000, fully covered by insurance.

The Packard Electric Co.'s automobile works at St. Catharines, which were closed down some time ago owing to trade depression, are starting up again.

Wortman & Ward, London, Ont., manufacturers of washing machines, pumps, etc., contemplate the erection of a factory at Estevan, Sask., at a cost of $75,000.

The Philip Carey Co., 112 Bay St., Toronto, manufacturers of steam pipe and boiler coverings are contemplating the erection of a plant in Hamilton or Welland during the coming summer.

A million dollar wheat elevator is proposed to be erected on Deadman's Island, near Vancouver, by J. W. Weart, who has interested Vancouver, Winnipeg and San Francisco capital in his scheme.

The Keystone Engineering Co., Toronto, are contemplating locating at Wiarton. They state if satisfactory arrangements can be made they will employ from 150 to 500 men and pay $100,000 annually in wages.

Jess F. Hinck, secretary of the Farmers' Friend Scale Company, Minneapolis, Minn., has been in St. John for some days and is organizing a company to manufacture farm scales for which his company holds patents.

Samuel Shimer & Sons, Milton, Pa., manufacturers of cutter heads, have established a branch Canadian factory at Galt, Ont. They have purchased the building formerly occupied by St. Clair Bros., and expect to commence operation at once.

The E. B. Eddy Co., Hull, is erecting a new pump with a capacity of 3,500,000 imperial gallons every 24 hours. The new pump, with one already in operation, will afford a means of supplying six million gallons of water a day for washing pulp and feeding a smoke consumer.

The Canadian Antimony Co., of Lake George, York Co., N.B., intend re-opening their antimony mine and build a smelter at Lake George and branch railway to Harvey Station on the C.P.R. Ore was once mined there in paying quantities. The company askx exemption from royalties for twenty years.

The property of the Canada Radiator Company at Lachine has been sold by auction to the Asbestos Shingle, Slate and Sheeting Company, of Ambler, Penn., for $63,000. The area of the property is eight acres. The purchasers will at once erect a plant of their own to carry on their manufacturing operations in Canada. The company is also engaged in mining operations at Thetford.

The plant of the Montreal Paper Co., at Portneuf, Que., was damaged recently to the extent of $60,000, by the collapse of a large front wall of over 60 feet in length, and 30 feet high, which had been undermined by the overflow of water in the channel being excavated for the operation of a new turbine. All the machinery fell into the canal. The mill will be stopped for at least four months.

At the recent annual meeting of the Woodstock, Ont., Board of Trade, the secretary read a communication from the Russell Harvesting Machine Company, in which a plan was submitted for the erection of a large factory in that city. The citizens are asked to take up $25,000 of stock, and the company wants free light, water and taxes for ten years, or a free site. The company was recently organized to manufacture grain shockers.

The Acadia Cold Storage Co., Halifax, proposes to erect a plant there that will cost $300,000. The building will be five storeys, and it will have a frontage on three streets, and near the terminals where the ocean-going steamers stock. The building will be constructed of reinforced concrete, faced with buff brick, manufactured by the Mayhew Brick Co., of England. The outside walls and partitions will be insulated with granulated cork, manufactured by the Armstrong Cork Co., Montreal. The mechanical refrigerating plant will be installed by the Lindey British Refrigerating Co., of Canada. The company will install its own electrical plant, furnishing power and light, and the building will be fitted throughout with its own telephone system. Two large electric elevators will be installed, also a spiral chute running from the top to the bottom of the building. There is only one chute of this description east of San Francisco, and it is in one of the New York plants, it being a modern invention. The plant will be a modern one, and the capacity will be very large.

New Companies.

The Holden Co., Montreal; capital, $45,000; to manufacture railway apparatus. Incorporators, N. J. Holden, A. L. Deguire, L. L. Johnston, Montreal.

Smith Hardware Co., Montreal; capital, $20,000; to deal in hardware and cutlery. Incorporators, D. G. Smith, A. R. Hall and S. W. Jacobs, Montreal.

Montreal Wire-Bound Box Co., Montreal; capital, $100,000; to operate saw-mills. Incorporators, A. J. Brown, R. C. McMichael, R. O. McMurtry, Montreal.

H. W. Petrie, of Montreal; capital, $40,000; to manufacture machines and machinery supplies. Incorporators, W. Laurie, T. P. Altimas, M. A. Phelan, Montreal.

Diamonds & Gold, Ltd., Toronto; capital, $2,000,000; to treat ores, metals and minerals. Incorporators, W. D. Earngey, J. B. Hall, Toronto, and W. D. Hook, Ingersoll.

The Ling Asbestos Co., East Broughton, Que., capital, $200,000; to mine and manufacture asbestos. Incorporators, J. W. Cook, A. R. McMaster, A. A. Magee, Montreal.

The Kent Co., Montreal, capital, $50,000; to manufacture ice-making and refrigerating machinery. Incorporators, W. G. Kent, G. Darling, A. W. P. Buchanan, Montreal.

H. L. Bowers, Ltd., Port Hope; capital, $40,000; to manufacture building, foundry and sanitary supplies. Incorporators, H. T. Bush, A. E. Pipher, H. L. Bowers, Port Hope.

Epstein's Press Syndicate, Montreal; capital, $20,000; to do general printing, bookbinding and stereotyping business. Incorporators, L. Angevine, R. Cerash, C. J. Hirt, Montreal.

Canadian Calculators, Ottawa; capital, $20,000; to make computing and calculating machines for all purposes. Incorporators, F. J. Nicolas, G. F. Thompson and R. G. Code, Ottawa.

Rondeau Gas and Oil Co., Kingsville, Ont., capital, $100,000; to produce and refine natural gas and petroleum. Incorporators, S. L. McKay, B. Jasperson, Kingsville; L. G. Neely, St. Mary's, Ohio.

The Metallic Packing Co., Montreal; capital, $20,000; to manufacture and deal in electrical, mechanical and hydraulic machinery. Incorporators E. A. Barnard, C. L. Austin and A. B. Johnston, Montreal.

Whipple Horse Collar Co., Hamilton; capital, $100,000; to manufacture horse collars and saddlery hardware. Incorporators, J. D. Whipple, Hamilton and C. F. Scharmann and E. M. Browne, Omaha City, Neb.

Empire Fence Export Co., Walkerville; capital, $10,000; to manufacture wire, wire fencing and products of wire and iron, as well as machinery. Incorporators, M. Church, Detroit; J. W. Coatsworth, R. P. Hall, Walkerville.

The Belden Sheaf and Hay Loader Co., Palmerston, Ont.; capital, $150,000; to manufacture machines and implements for harvesting grain or hay. Incorporators, W. L. Holmes, Brussels; Geo. Howe, Palmerston, and W. R. Belden, Township of Grey.

Gas Items.

A gas plant proposition is talked of by the Lindsay Board of Trade.

The Acadia Gas Engine Co.'s factory at Bridgewater, N.S., is again working full time.

The B.C. Electric Co. contemplate erecting a large storeroom at the Gas Works, Victoria, to cost about $8,000.

The Calgary City Commissioners are considering the matter of assisting the Calgary Natural Gas Company to the extent of $10,000.

C. E. Dettman, Waynesburg, Pa., will start boring for oil and gas in the neigbborhood of Peterboro' in a short time. This intelligence was given to the farmers from whom a lease has been secured of their property. It is mainly an experiment, although some are of the opinion that a find may be made.

James Fleming, proprietor of the Phoenix Foundry, St. John, who started manufacturing gasolene engines a couple of years ago, reports a growing demand for them and they have a very large number under way or finished and ready for shipment. The firm state that they have had more orders lately than they could fill. They find this branch of their business a most important one, giving employment to many hands and giving promise of expanding from year to year.

Trade Notes.

Wm. H. White has started to manufacture bungs, taps and spiles at Lachine, Que.

Frederick B. Stevens, Detroit, dealer in foundry supplies, is opening a warehouse in Toronto.

Peiler and MacKenzie, Montreal, have moved from 17 St. John street to suite 104, 52 St. James street.

The Manitoba Iron Works, Winnipeg, have secured the contract for all the transmission material for the Elk Lumber Co.'s new mill at Fernie.

The A. R. Williams Machinery Co. have securthe agency of the Alamo Manufacturing Co., Hillsdale, Mich., manufacturers of gas, gasoline and alcohol engines.

The Dominion Foundry Supply Co., 20 Pearl St., Toronto, are installing a No. 7 Whiting cupola in the Ontario Malleable Iron Co.'s plant, Oshawa, Ont.

The switchboard and panels for the new Y. M.C.A. building, Ottawa, are being supplied by the Hill Electric Switch & Mfg. Co., 1560 St. Lawrence St., Montreal.

Kellogg & Co., machinery merchants, have opened up an office at 196 King St. West, Toronto, and will handle metal and wood working machinery, power equipments and special machinery.

The Northern Electric and Manufacturing Co., Iberville, Que., have been awarded the contract for supplying and installing a western electric alternator, exciter and switchboard equipment for that town.

The Northern Electric & Manufacturing Co., have been awarded the contract for a Western Electric 260 k.w., 2,200-volt, 60-cycle, polyphase alternator and switchboard for the town of Macleod, Alberta.

The Schaake Machine Works, New Westminster, has completed its first consignment of twenty Johnston shingle machines which were ordered by the Davidson Ward Lumber Company for their mill at Loughborough Inlet.

The B. Greening Wire Co., Limited, Hamilton and Montreal, are installing electric welding machinery in their works for the more economical welding of the iron frames for their wire door mats, wire guards, tellers' cages, etc., and for the wire chain fittings and the welding of wire generally.

Jones & Glassco, 334 Notre Dame St., Montreal, report an order for twelve chain drives from The Wire & Cable Co. Mr. Hathaway while in England, investigated the application of chain drive and the orders are a result of his investigations. The J. R. Booth Lumber Co. placed an order for four 60 horse power Renold drives.

The following recent orders are reported by the Smart-Turner Machine Co., Hamilton: pumps from Technical School, Hamilton; City Bath House, Toronto; Collingwood Shipbuilding Co., Collingwood; steel tumbling barrel from Canada Screw Co., Hamilton; and two independent jet condensers from Doty Engine Works, Goderich.

The town of Edmonton, Alta., have recently ordered from the Robb Engineering Company, Amherst, two 600 H.P. Robb-Armstrong engines of the vertical enclosed high speed type for direct connection to electrical generators. Orders have also been received from the city of Calgary for one 750 k.w. vertical enclosed high speed type, three crank compound for direct connection to 500 k.w. electrical generator; from McLeod, Alta., two 120 h.p. Robb-Mumford internally fired boilers, and from Saskatoon, Sask., two 250 Robb-Mumford water tube boilers.

H. W. Petrie, of Montreal, Limited, have been incorporated to take over the business of H. W. Petrie, Limited, in Montreal, and Eastern Canada. This change is made with the view of benefitting the customers of the firm in the east who will now deal wholly with H. W. Petrie, of Montreal, Limited. Mr. Petrie, of H. W. Petrie, Limited, is the president of the new company, A. W. Rovan, vice-president and manager, T. P. Altimas, secretary-treasurer, and the entire staff of the old company has been retained.

A new corporation bearing the title The Cincinnati Bickford Tool Co., has been formed to acquire the business of the Bickford Drill and Tool Co. and of the Cincinnati Machine Tool Co. The capiatal stock is to consist of $350,000 of common and $150,000 of preferred stock. The new company is to build at once an entirely new plant at Oakley, the new manufacturing suburb of Cincinnati. August H. Tuechter, president of the Cincinnati Machine Tool Co. will be president of the new company. The other officers are Sherman C. Schaver, vice-president and general-manager; W. H. Shafer, secretary; G. P. Gradoff, treasurer, and H. M. Norris, Mechan. Eng.

Large Industry for Toronto.

A few months ago Canadian Machinery announced that the Standard Sanitary Mfg. Co., Pittsburg, were looking for a Canadian site. They have decided upon Toronto and will employ about 600 hands. This company is one of the largest manufacturers in America of bath tubs and all kinds of porcelain ware.

Welland, Ontario.

The City of Welland has a live Board of Trade who keep that city before the public. A booklet recently issued from the office of J. D. Boyne, Secy. Board of Trade, Welland, tells of the railway facilities, available power, etc. Two representatives of the Welland Board of Trade attended the National Tariff Convention held in Indianapolis in January, at which 1500 manufacturers were in attendance.

Cleveland Industrial Exposition.

Cleveland's Industrial Exposition, which will be held June 7th to 19th, promises to be unique in the history of home-product expositions in the diversity of manufactures shown. Among the exhibitions will be machinery, hardware, transportation, paints, oils, builders' supplies and similar sundries, the other to illumination and finely finished articles such as furniture, clothing, leather, printed matter, and numberless specialties and novelties.

Handsome Calendar.

The Allis-Chalmers-Bullock, Montreal, have issued a handsome hanger. Above a calendar is an interesting picture, "The First Engineers." This picture was designed for the Allis-Chalmers-Bullock Co., the original being painted by Arthur H. Hider, a well-known Canadian artist. It shows beavers at work and the theme is very appropriate as the Allis-Chalmers-Bullock Co. are also hydraulic engineers. The calendar is for twelve months dating from March 1909.

Time-Recorder Companies Amalgamate.

The International Time Recording Co., of Canada, and the Canadian Time Recording Co., both of Toronto, have amalgamated under the name of the International Time Recording Co. This company is now capitalized at $40,000 and the head office for Canada will be 19 Alice St., Toronto.

All kinds of time recorders will be manufactured in Canada so that customers may be supplied with either the domestic or imported articles. The following officers of the new company have been elected: Pres., H. W. Balfley, and M. D. Cranston, sec. and treas.

C.P.R. Shops for the West.

The conference of Canadian Pacific Railway officials on the question of train service in the West this summer was held in Winnipeg recently. The superintendent discussed improvements to be undertaken throughout the season. It is stated that the largest project under discussion by the railway officials are large and modernly equipped car building shops, which will form the nucleus of a plant that will ultimately turn out finished locomotives built from British Columbia iron and steel. The shops will be built on the line at Westminster Junction, about twenty miles from Vancouver. Operations will likely be started at once, so that freight cars will be ready for the western movement of grain next fall.

Contract for Lock Machinery.

The William Hamilton Co., Peterborough, have received a contract from the Railway and Canals Dept. of the Dominion Government for the supply of lock machinery for seventy-four locks.

It includes the supplying of all the operating machinery, anchorage fittings and pivots for twenty-four locks made up of the following: Two at Trenton, three at Glen Miller, one at Frankfort, five at Glen Ross, one at Raney Falls, one at Campbellford, three at Middle Falls, one at Healey's Falls, one at Hastings, one at Rosedale, one at Lindsay, three at Holland's Landing, and one at Newmarket. The contract amounts to about $100,000 with extras.

Railroad Development at Cochrane.

The Temiscaming and Northern Ontario Railway Commission have called for tenders for the following works:—

1. Engine house and machine shop at Cochrane. 2. Locomotive foreman's office and petty stores building at Cochrane. 3. Heating plant for Cochrane roundhouse and machine shop. 4. One 75 ft. turntable complete at Cochrane. 5. Coal shed and trestle at Cochrane. 6. Culvert near Mileage 22¼. 7. 4 ft. arch culvert near Mileage 50¾. 8. 20 ft. 1 beam span near Mileage 62¼. 9. 20 ft. re-inforced concrete arch culvert near Mileage 222¼. 10. One 8 ft. re-enforced concrete arch culvert near Mileage 221. 11. One 11 ft. re-enforced concrete arch culvert near Mileage 218¾.

Canadian Machine Tool Markets

VANCOUVER.

At a meeting of the C.P.R. superintendents held in Winnipeg, recently, the subject of new shops for British Columbia was discussed. If the plan goes through new car shops will be erected at Westminster Junction, a point 20 miles from Vancouver on the main line. It seems a feasible proposition for lumber from here is shipped to the car manufactories in Eastern Canada. Not only cars but locomotives are talked of, but these locomotives will be mostly for the lumber and logging industry. Many of these are used in this province, with the prospect of a good demand for years to come, since with the logging of areas close to the water, more power will be needed the further back timber is located.

General conditions are very encouraging. The lumber mills, both on the coast and in the interior, are starting up one after another, though in the territory east of the Cascades there are still a number of idle plants. Logs are going up in price, and a rise in the price of lumber is bound to come, for with the raw material at $9 and $10, rough lumber cannot be profitably sold at $12 and $13. An indication of the business in sight is shown by the large orders held by the Fraser River Lumber Company, at Fraser Mills on the Fraser river. These aggregate twelve million feet, over half of which is to be supplied to the G.T.P., the other firms in the contracts being the Rhodes Curry Company, of Amherst, N.S., the Ottawa Car Company, and dealers in the territory west of Regina.

WINNIPEG.

E. E. Sheppard, the manager in Winnipeg, for the Dominion Bridge Co., has been notified that this company intend expending $100,000 in increasing the output of their plant here. The present output is about four hundred tons per month. With the proposed extension this output will be about twelve hundred tons per month. The company, when the new plant is installed, will be able to carry about four thousand tons of raw material in stock. They are at present supplying the steel to the new union depot, and Nova Scotia bank, now under construction.

There is a decidedly hopeful outlook though trade generally is rather quiet at the present time. In some parts of the west, however, trade is much more brisk. There are prospects for some good business in power machinery and supplies. The cities appear to be the largest buyers of power equipments and many are planning the instalation of lighting plants during the coming summer.

TORONTO.

From the number of inquiries, one would judge that business in the machine, tool and foundry trades is entering a period of steady, substantial prosperity. The government trade returns and railroad receipts show increases over the corresponding period last year and there is a cheerful tone among the dealers and manufacturers, and there is every assurance of larger business in the coming months.

The foundry supply houses report an improvement in orders. There are prospects of a number of new foundries being erected and requiring complete equipment. The Standard Sanitary Mfg. Co., Pittsburg, has decided to erect a foundry and shops in Toronto for the manufacture of all kinds of sanitary ware.

MONTREAL.

There have been no developments during the past month that would point to an increased activity in the machine tool market, nor its allied lines, machinists' supplies and tool steel. In the former there are still small outbursts in some quarters that have the effect of making some one house very busy for the time being and, of course, this house reports an increase in the demand. These flashes in the pan may or may not be forerunners of permanent improvement. This remains to be determined.

If the market were qualified by the amount of tools on which prices have been figured it could be said that it is rapidly regaining normal strength, but unfortunately orders are placed for only a comparatively small amount of the tools on inquiry.

This time of the year is the best time for woodworking tools and the movement in these lines is quite brisk.

The tool steel situation is just steady and castings are moving very slowly

CATALOGUES.

DRILL SOCKETS—Price list of "Use Em-Up" drill sockets from American Specialty Co., 1440 Monadnock Bldg., Chicago.

TWIN GAS HEATER—Pamphlet from L. S. Starrett Co., Athol, Mass., describing double tube gas heaters for tempering small tubes, melting babbit, etc., in the machine shop.

BLACKSMITH TOOLS—Catalogue 78 B, from Buffalo Forge Co., Buffalo, N.Y., of hand power and electric forges, stationary and portable in various types, tuyere irons, blacksmith's drills, etc.

TAPS AND DIES From A. B. Jardine & Co., Hespeler, Ont., describing tube expanders, axle cutters, taps and dies, bolt threading and nut tapping machines, hand drilling machines, tire benders, etc.

SMALL TOOLS—Catalogue 16, from Standard Tool Co., Cleveland, O., 302 pages describing drills, reamers, taps, chucks, cutters, etc. Tables of standard screw threads, decimal equivalents, etc., are included, making it a very useful volume

FRICTION CLUTCHES—From the Hill Clutch Co., Cleveland, Ohio, a booklet containing a reprint of a paper read before the annual meeting of the American Society of Mechanical Engineers, "Tests of Friction Clutches for Power Transmission."

BORING MACHINES—From Niles, Bement, Pond Co., 111 Broadway, New York, a catalogue of deep hole drilling and rifling machine built at the Pratt & Whitney Works, Hartford, Conn. These include machines for drill and gun barrel drilling, and gun barrel grinders

STEAM ENGINES—Catalogue from J. T. Schell, Alexandria, giving a full description of a new line of automatic engines being built for the Canadian market. They are known as the "Auto-Climax" vertical high speed engines. The catalogue will be sent on receipt of address

WIRE SCREENING—From the B. Greening Wire Co., Hamilton, 161 pages, illustrated, gives a brief history of the company and describes the heavy hard steel wire screening, wire cloth for locomotives, mining screens, threshing machines, tanning mills, etc., brass and copper wire cloth, perforated sheet, brass, zinc and steel. This is the first catalogue of a series of illustrated catalogues describing the products of the B. Greening Co. Tables of hard wire screening, decimals of wire and weight of finished article are given. Tables of mesh and weight of wire cloth are included from ¼ of an inch to 90 mesh together with the gauge of wire and the decimal size of opening. Copies of this valuable catalogue will be sent to readers of Canadian Machinery on request by sending the address and mentioning this paper. The other catalogue of the series will be mailed at an early date.

FORGINGS

We are now in our new shop and are ready for all kinds of forgings—light and heavy.

Railway Tools, Ice Tools, Hammers, Engine Cranks, etc.

We also manufacture Cement and Concrete Machinery.

A Man Who Can Earn $72,000 a Year

in a big establishment must know pretty nearly all that is worth while about "Salesmanship." Hugh Chalmers, of Detroit, is the man who climbed the $72,000 ladder. He knows how to "hire, manage and supervise men," and when he talks, it is in a racy style.

His views—snappy, bright and terse—appear in the April number of Busy Man's Magaziue. The article is thus written by one who knows—one, who at 29 years of age, was vice-president and general manager of a plant employing 5,000 persons, and directed a selling force of 500 men.

Business men—young men especially—should read this article. It is inspirational. It will incite them to greater things, assist them to realize what constitutes true salesmanship, and practice the basic principles on which it rests.

Capitalized Himself At $1,000,000

annually was what Chalmers did when working as a salesman, and he declares that "Salesmanship is nothing more or less than making the other fellow feel as you do about what you have to sell."

There is no greater art in the commercial world to-day than Salesmanship. You can learn a lot about it about progressive business systems and methods—by reading Busy Man's Magazine each month. It is a publication full of ginger, alive with personal precept, direct in daily application

It reproduces the latest and best contributions on business, industry, commerce and politics, from the current magazines of the world, and has much bright, original Canadian matter as well. Annually, it is a big $2 worth; monthly, it is worth a great deal more than the price of a single copy—which is 20c.

Flat and Flat Twisted High Speed Drills with

Common Standard Taper Shanks

Everyone knows that the flat and flat twisted high speed drills are good. There have been two good reasons why they were not used more, viz.: they did not run true and it was necessary to buy expensive special chucks to drive them. These objections have been overcome in the "Collis." The shank is a *common standard taper,* giving a true running drill and no special chucks are required.

We will furnish these drills with the shank flatted to fit the "USE-EM-UP" Drill Socket at no extra cost. They can then be used in either a standard socket or the "USE-EM-UP." By so doing all trouble from twisted tangs or broken shanks is eliminated, and at the same time all the advantages of the taper shank drive are retained.

MILLED DRILLS SUPERSEDED ! !

J. Beardshaw & Son
LIMITED

Baltic Steel Works

Sheffield

USE THE BEST !

Save Time!
Save Money!

All expensive milling is avoided. The natural fibre of the bar has not been cut into.

Increased Economy.
Increased Efficiency.

Improved High Speed Twisted Drills,

Made from Beardshaw's Celebrated "H.V." Profile Tool Steel.

The Most Economical High Speed Steel.

Use Beardshaw's High Speed Steel for Deep Cuts.
Made in ordinary and profile sections which give an average all-round saving to the users in purchased weight alone of 50%.

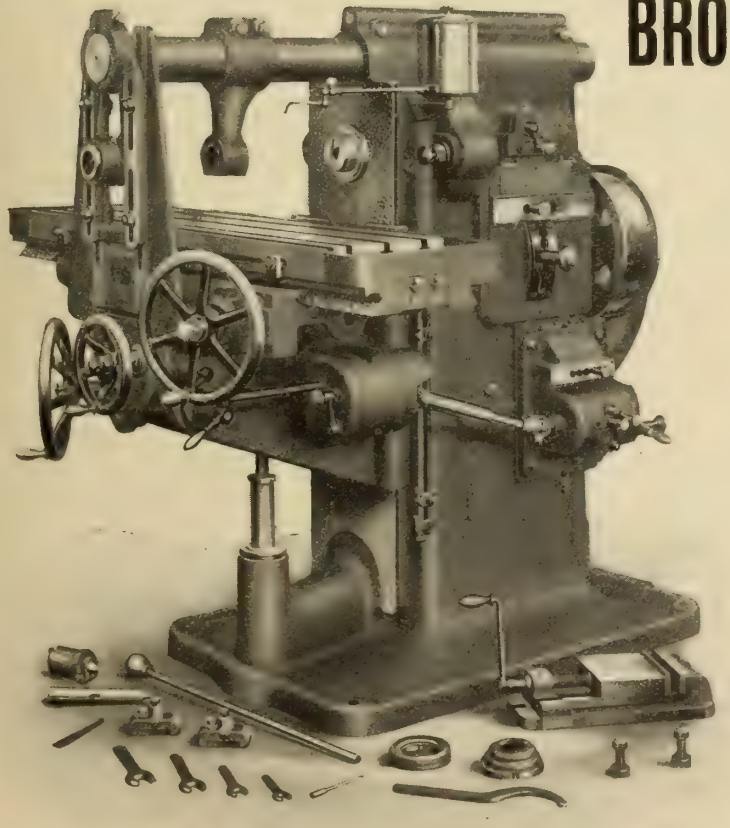
Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.



BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.

With the Constant Speed Drive Milling Machine you have the Advantage of Ample Power.

The growing use of High Speed Steels requires of milling machines increased power, especially in large machines, and those factors which are necessary to develop power are realized to the fullest extent in this type of machine. The constant speed drive permits the use of counter-shaft and machine pulleys, of large equal diameter, taking a wide belt and running at a high constant speed. This gives large belt contact and high belt velocity, the two requisites of power.

Milling Machine Circular sent to any address.

MANUFACTURERS AND MANUFACTURERS' AGENTS.

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate - $2.50 for twenty words or less, 10c a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

DUPLICATING DEVICES.

IF interested in a Duplicating Machine for getting out circular letters, reports, price-lists, etc., or for printing various office forms, write for booklet and samples of work. The "POLYGRAPH" is the newest, latest and best, and sells for a lower price than the others. Is unexcelled by any similar device on the market. F. W. Tenney, Canadian Sales Agent, 123 Bay St., Room 116 Stair Bldg., Toronto, Canada.

GASOLENE ENGINE CASTINGS.

MARINE gasolene engine castings, with blue print and full instructions, etc.; 2½, 4, 6 h.p.; also complete finished outfits at $65 up; catalogue, Krug & Crosby, Hamilton. [10tf]

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

ADDING TYPEWRITERS write, add or subtract in one operation. Elliott Fisher, Limited, 129 Bay Street, Toronto.

THE RELIABLE LIGHT will light your store 100% better than gas, electricity or acetylene. 600 candle power light costs 1 cent per hour to operate. Thousands in use. A safe, reliable, pure white light of intense brilliancy. Write for booklet M. The Rice, Knight Mfg. Co., Limited, 40 Lombard Street, Toronto. (1)

NOTICE!!—Users of Pitner Gasoline Lamps are warned against being induced to purchase parts of other makes of lamps to be used on the Pitner. The most vital part of any lamp is its generator and the Pitner Generator has been granted a patent in Canada, the United States and other countries, on the principle of its improved method of generating gasoline vapour. Supplies and parts for the Pitner Lamps can be received by return mail by applying to our representatives or direct to THE PITNER LIGHTING CO., Limited, 36-38 Lombard St., Toronto, Ont. (tf)

BUSINESS CHANCES.

PATENT NOTICE—The owners of Canadian Patents Nos. 95125, 95126, 96650 and 102647, for improved processes for working silica glass and making articles out of fused silica, and for an improved furnace for working silica, are desirous of finding Canadian manufacturers who will take a license under their patents. The processes are being satisfactorily carried out in Great Britain and a considerable number of articles are being made and sold. Applications for licenses may be addressed either to THE THERMAL SYNDICATE, Ltd, of Neptune Bank, Wallsend-on-Tyne, England, or to OWEN N. EVANS, Solicitor of Patents and Expert, Merchants' Bank Building, Montreal, Canada. [4]

ARTICLES FOR SALE.

ELLIOTT-FISHER Standard Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513 No. 83 Craig St. W., Montreal, 129 Bay St. Toronto.

Factory for Sale

Large factory on Lachine Canal, near the city; about 8,000 square feet of floor and 20,000 square feet of ground, with water power. Close to G. T. R., C. P. R. and boats. Apply to L. E. Godin of McAvoy, Lemieux, Dupre & Godin, 4 St. Lawrence Boulevard, Montreal. 4-09

MACHINERY FOR SALE.

MACHINERY FOR SALE—1 2nd-hand 5½ h.p. vertical boiler and engine, cast iron base supporting same, all in A1 condition; 1 11 h.p. gas engine, 2nd hand, fitted with magneto, and in first-class condition; 25 2 h.p. new horizontal gasoline pumping and power engines combined, capacity 25 barrels per hour, elevated 100 ft.; also 5 h.p. new gasoline vertical power engines, suitable for boat or launch; 1 24"x24"x7" iron planer, 2nd hand, including chuck. Address, J. D. Anderson, Machinist and Engineer, Box 203, Windsor, Ont. (4)

PERIODICAL DEPT.

THE BUSY MAN'S MAGAZINE is the most popular periodical of its kind. Why? Because each issue contains a strong list of original articles of interest to every Canadian. It also reproduces the most timely, instructive and interesting articles appearing in the other magazines and periodicals of the month. The cream of the world's periodical press is too valuable to overlook. BUSY MAN'S is on sale at all news-stands. Better still, send $2 for one year's subscription. Mail it to day. The Busy Man's Magazine, Toronto.

OIL ENGINE FOR SALE.

NINE Horse Power New Campbell Oil Engine, Electric Lighting type. Cheap. Most economical engine for small plant. Jones & Glassco. Montreal. (4)

FACTORIES FOR SALE.

IN the growing town of Welland, Foundry, Machine Shop and Carpenter Shop, with engine, boiler and line shafting; blacksmith shop, boiler shop, pattern and other storehouses. Welland has cheap electric power, natural gas, sewers, fine railways and water transportation on Welland Canal. Apply M. Beatty & Sons, Welland, Ont.

VALUABLE Manufacturing premises in the town of Galt—Building is of stone, three storeys, equipped with boiler, heating and lighting pipes. Immediate possession. Apply to C. R. H. Warnock, Galt, Ont.

Three Appointments to be Made

Professors of Civil, Mechanical and Electrical Engineering

The Government of Nova Scotia will appoint men to above three chairs in its Technical College during June or July. Applicants must have college degree and also practical experience.

Address: The Director, Department of Technical Education, Halifax, N.S. (5)

Think—Then Act

By A. B. LEVER

THERE are a great many people who think about advertising who never get beyond the thinking stage.

They are like some men who fall deeply in love, but being afraid to "pop the question," die bachelors.

What is wanted with a great many business men who think is decision.

Faint heart never won fair lady, and faint hearted business men do not make successful business men.

Good intentions count no more in advertising than good intentions in religious life.

There must be decision, plus action.

Think about advertising by all means. Good advertising can't be done without good thinking, but mere thinking never accomplishes anything.

Every day you waste in thinking is an opportunity lost for getting a new customer.

Opportunities lost to-day cannot be gathered up to-morrow.

Think, decide, then plan for a good advertising campaign, and judiciously use the mediums which directly reach the people to whom you want to sell.

Butterfield & Co.

ROCK ISLAND QUEBEC

New Standard

Old Standard

A New Standard

The "Stantool"

SHORT TAPER SHANK WITH HEAVY TANG

Modern methods of drilling demand a stronger construction of shank and tang than the old standard. The "Stantool" shank meets this condition. It has much greater strength, offers a positive drive and overcomes the breakage which has heretofore been a serious difficulty.

"Stantool" Sockets and Sleeves

fit the new standard shank and are made to fit the taper spindle of all makes of drill presses.

THE STANDARD TOOL CO.

Cleveland, Ohio **94 Reade St., New York**

Use the **Geometric Self-Opening Screw Cutting Die Heads** as a stepping stone to maximum output with minimum expense in thread cutting. We make them in sizes suitable for cutting, from the smallest screw up to a 4½ inch bar.

As the dies are opened automatically at the end of the cut, 50% of the time consumed in backing out solid dies is saved, which also does away with the stripping and marring of threads usually experienced in the use of solid dies.

How You Can Do It!

A manufacturer of a certain article sat down to figure out why he wasn't getting rich. His product was excellent in quality and there was an active demand for it. But many people who needed it considered the price was too high and contented themselves with an inferior substitute that cost less.

In the midst of his reverie a friend entered, to whom he told his troubles. Can't you reduce cost by getting more efficient machinery?" said the friend. "I don't know—the machinery is pretty good," said the manufacturer. "Well," said the friend, "I'll tell you what to do. Call up the Bawden Machine & Tool Co. and ask them to send you an expert machinist. Let him look over your machinery and output; tell him what your cost limit is, having your competitors in view, and it's ten to one he can design you some machinery that will cut down your manufacturing cost to the figure you name. Bawden's did that for me, anyhow! Their address is:

Don't Take Chances

on poor Facings—think of results! We are manufacturing a Facing that never fails to give satisfactory results, refining it by our own special process from

GENUINE
CEYLON PLUMBAGO

This facing of ours is an impalpable powder, almost entirely free from "flake," the latter, though very useful as a lubricant, is undesirable in a Facing. It requires no more time to apply to the mold than inferior Facing and it saves fully 100% in the cost of cleaning and chipping castings. We are also making a special

Stove Plate Plumbago

containing all the elements necessary to leave a beautiful color and finish to the casting; it does not wash or run before the iron or burn under the gate, and the sand peels off easily.

In stove plate work, our Stove Plate Plumbago is used in conjunction with our specially prepared

Charcoal Return Facing

which makes a good impression on the face of the mold, prevents the heavier facing from sticking to the pattern and assists in peeling the sand from the casting.

The Hamilton Facing Mill Co.

Limited

Hamilton : Canada

Everything for the Foundry, from a Dust Bag to a Cupola.

"The oldest and most reliable Foundry Supply House in Canada."

Save the Cents—the Dollars will take care of themselves

Is your core maker using Plumbago as a core wash? Our **Eureka Blacking** is better and will save the Plumbago, also about 75% to you of the cost of the Plumbago so used.

Our **Galvarim Riddles** (metal rim and adjustable bottom) will cut your Riddle bill in two.

Instead of scraping that casting with the blow hole, fill it with our **Detroit Iron Filler**—saves the labor of producing a new casting and loss in shrinkage of iron.

Other Canadian foundries are doing what we recommend above, and are gratified with the results. The cents so saved will mean a great many dollars to you in a year's time.

Write us if you wish free samples or other information.

The Campaign of 1909

When a political campaign document is constructed it must be carefully constructed or else it is liable to be punched full of holes.

The error is discovered too late.

It is much the same way in the foundry business; the error in use of poor materials is only discovered when it is too late for correction.

If you are making machinery castings, you ought not to keep house without **STEVENS' PURE PLUMBAGO.** It is the pure quill. It goes farther in actual use, and produces a clean, smooth face.

If you are using a wet blacking on molds or as a core wash, **STEVENS' CARBON BLACKING** will give you pocket-book satisfaction.

If you want to fill a hole in a casting, otherwise good, **STEVENS' STOPPER** will stop it so you cannot find it; a fine powder mixed with water, easily applied, and costs much less than the many substitutes.

KING KORE KOMPOUND—one part compound to thirty or forty parts of sand, and no odor and no trouble.

I manufacture Foundry Facings, Foundry Supplies, Buffing Compositions and Platers' Supplies. They all bear the stamp of quality.

EXPORT WAREHOUSE
Windsor, Ont.

Do You Want to Lower Your Foundry Costs?

Lower Foundry Costs mean increased profits and this is what you want. We can help you increase your profits:—

In the Core Room by supplying you with KANTBEBEAT DRY CORE COMPOUND. Used 30 or 40 to 1, instead of 10 or 12 to 1 (like flour). Does not swell or blow (like flour) and cores do NOT crack. KANTBEBEAT will not absorb moisture and, as the cores practically clean themselves out, there is a big saving here. There are NO offensive odors. A barrel sent on approval, if it doesn't SAVE YOU MONEY, send back what's left at our expense—no charge. We trust your sense of fairness.

In the Foundry by supplying you with our CEYLON PLUMBAGO and DOMINION SILVER LEAD, which leave the castings bright and clean, saving money in your fettling room. We also supply WHITEHEAD BROS. CO. MOLDING SANDS. There are none better produced and the best is cheapest in the end. OUR SEA COAL FACING is ground from the famous Youghiogheny Valley Coal.

In Your Equipment by supplying you with WHITING CUPOLAS, Cranes, Tumblers, Turntables, Air Hoists, etc., all of which are of the best design, simple and durable—therefore economical.

In Your Heats by supplying you with OUTERBRIDGE SILICON ALLOY, which softens and strengthens the iron, insuring perfect harmony between foundry and machine shop.

There are many other ways in which we can be of assistance, so let's get together and talk over your foundry requirements. We can furnish YOU with anything and everything you need and, as WE ARE THE ONLY FOUNDRY SUPPLY HOUSE IN CANADA HAVING TWO WAREHOUSES, we are in the best position to give prompt shipments from the large stocks always on hand. For the same reason OUR PRICES ARE CLOSEST and it will be to your advantage to get our quotations before ordering. Immediate attention given to all inquiries; we clean our slate before we close.

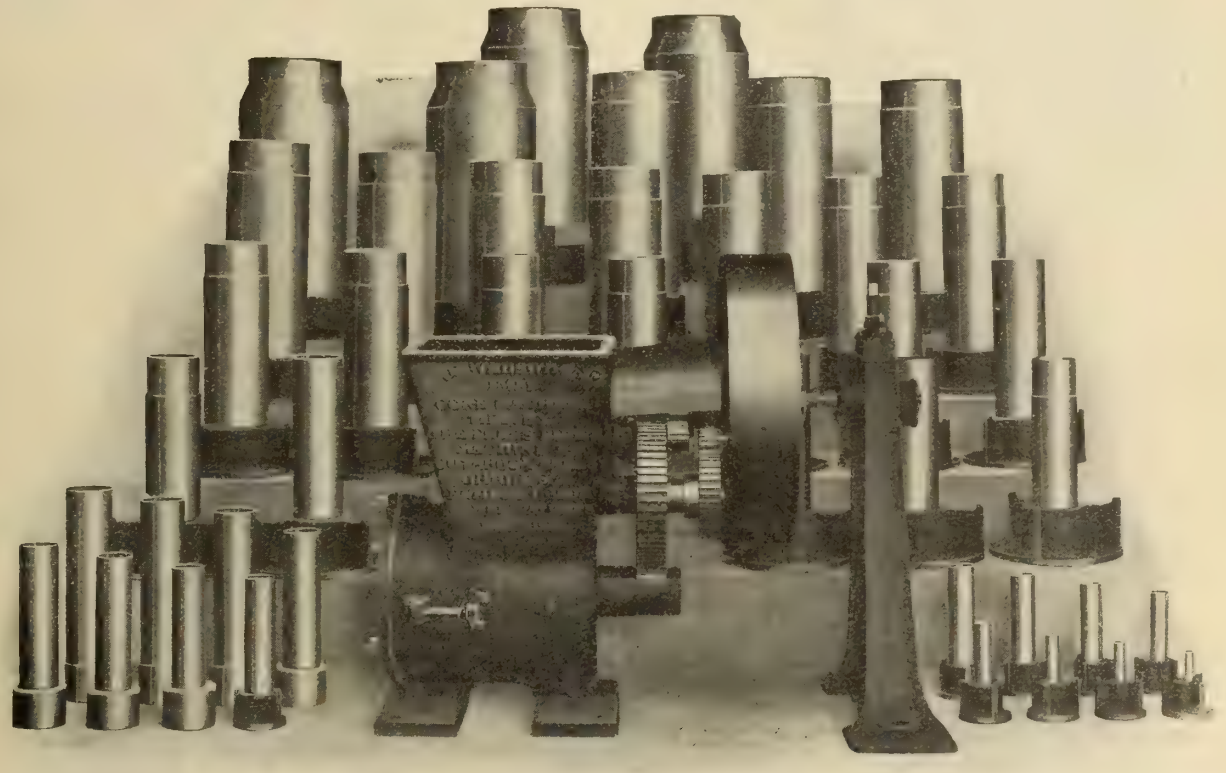
THE WADSWORTH
IMPROVED CORE MACHINES

The only Core Machine manufacturers in the world manufacturing a complete line of Core Making Machinery—5 separate and distinct Core Making Machines, Portable Core Ovens to bake the cores in after making. Core Cutting Off and Coning Machines and manufacturers of a Standard Core Print.



The only Core Machine manufactured that can make a Rodded Core. Any size rod can be used. Hand or Power driven, makes round Cores from ⅜ in. to 7 in. Also irregular shapes. 40 sizes of Cores, all made on one machine.

We are Core Machine Specialists

Compare your time with that of THE WADSWORTH Machine.

One 6″ Core, 24″ long, by hand power in 12 seconds.
One 7″ Core, 5′ 3″ long, by hand power in 80 seconds.

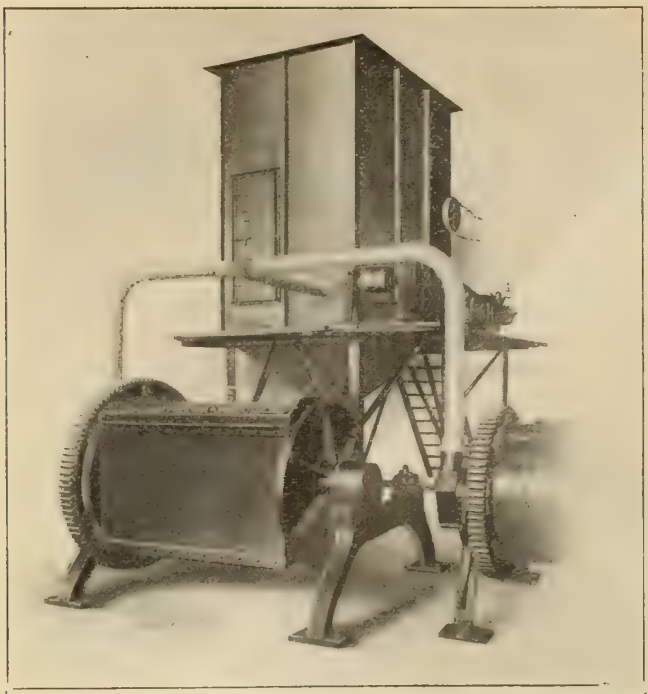
The great strength and accuracy of cores, together with the wide range of shapes possible, make them a valuable foundry investment.

Write for prices and descriptive catalogue.

The FALLS RIVER & MACHINE COMPANY
Cuyahoga Falls, Ohio, U.S.A.

SOLE CANADIAN AGENTS:

THE HAMILTON FACING MILL CO., LTD., Hamilton, Ont., and Montreal, Que.



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent **Dust Arrester.** Your mill room should be just as free from dust as the best equipped machine shop.

Have you a model plant? Why not be in the lead? You are not using flint to kindle your fires, nor candles to light your plant, nor a two-wheeled cart to deliver your castings. Modern improvements are working to the front every day, and if we want to be abreast with the times, we must follow suit.

Apply this same logic to your foundry cleaning room. The old impression that a scratch shop must be similar to a hurricane on a desert, is fast fading away. Sly Mills will work wonders in your cleaning room. Castings tumbled by the exhaust process will present a clean, polished surface, and give your foundry prestige in that your work will be the best. In order to have clean castings, the dirt must be drawn away from the mills as fast as it is scratched from the castings. This dust pulled by an exhaust fan to our Dust Arrester will settle your cleaning problem. Your mill room will be free from dust, your men can do better work, your castings will be cleaned in one-half the time, and the dirt and grit will not fly about your plant to injure your machinery, and go beyond your plant to become a public nuisance. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

Built in 12 sizes. Holding from 400 to 2,200 pounds of sand. Shipped on ten days' trial.

Danic Sand Blasts are Worthy of Investigation

Some of the Reasons:

(1) Any pressure up to 100 pounds available, giving most satisfactory results in every line of work.
(2) The flow of sand is under perfect control and is free and uniform at all times.
(3) There are no special or costly parts to break or get out of order.
(4) They are economical in cost and efficient in operation.

LET US TELL YOU THE REST.

FOUNDRYMAN!

The past year marked the introduction of our Foundry Supply Department and although a new line with us, we feel gratified at the large amount of business secured during the year 1908, and we thank you for your very generous patronage and hope to have a continuance of the same during the present year.

In order to give greater attention to our growing Foundry trade and to take the best means of presenting the many advantages of our specialties and productions, we have divided the ground into three territories which will be covered by our representatives as follows:

Eastern Territory - Mr. Albert U. Coté
WesternTerritory - Mr. T. Essery
Montreal Territory - Mr. G. F. Cowper

When in doubt specify Hyde quality.

Pattern Making

By James Ritchey

Instructor in Wood Working, Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

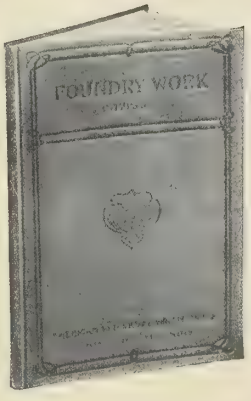
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

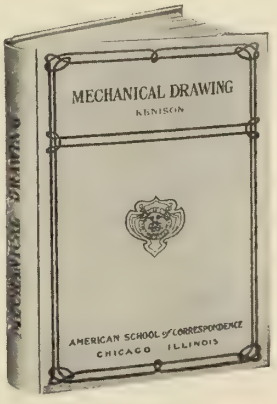
Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

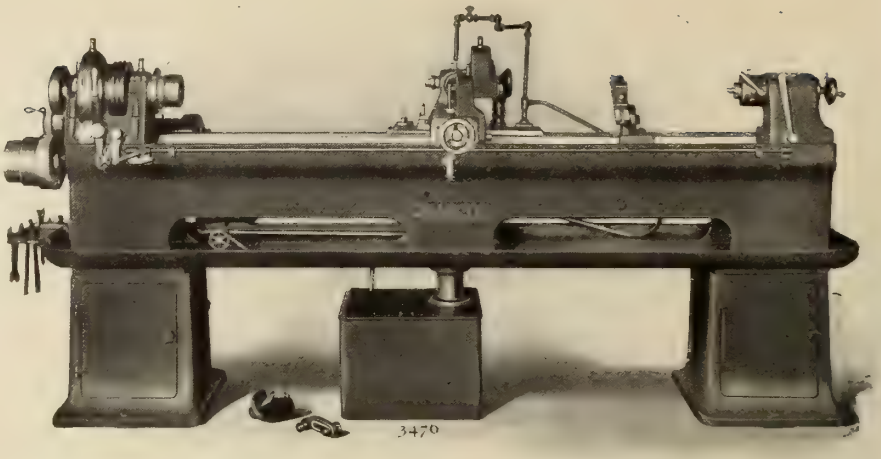
MILLING THREADS

is the modern way ensuring greatest accuracy as well as increased output.

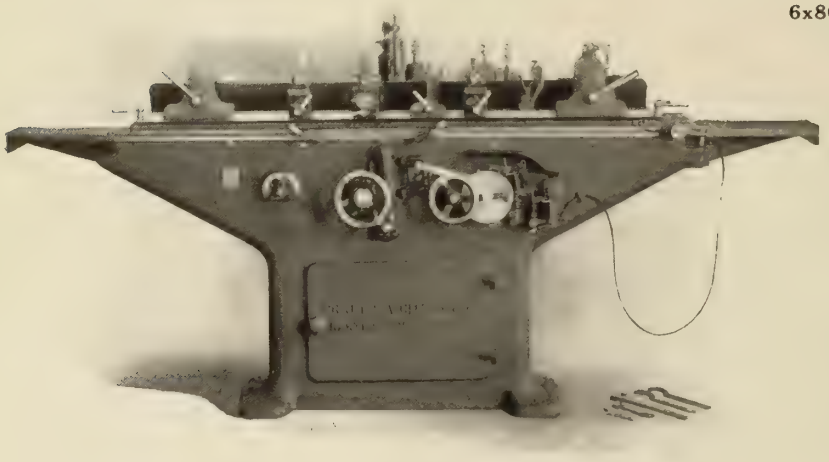
Soft or hard spots in the stock are not torn or chipped.

For screws, spiral gears, worms, flexible shafts, etc., the lathe cannot compete in accuracy, finish or output.

Write for Catalog "Thread Milling Machines."



6x80 Inch P. & W. Thread Milling Machine—Built in 6 sizes.



The 5x48 P. & W. Automatic Sizing Grinder.

AUTOMATIC GRINDING TO WITHIN .0001 INCH

Removing the last thousandth, usually the most expensive part of a grinding operation, is done on the P. & W. Automatic Sizing Grinder at practically no cost.

The heavy coarse feed is automatically changed to a fine feed and work is quickly ground with a fine finish to exact size without calipering.

Machine measures faster and more accurately than any man can do it.

Wear of emery wheel has no effect whatever.

Write for Illustrated Circular.

THE OPEN TURRET

Solid backing for tools as well as a solid seat.

30% heavier than any turret lathe of its size.

Cross sliding turret with a broad base and narrow guide.

Stationary head stock, most practical and convenient for either belt or motor drive.

Positive turret binder.

Adjustable "S" Nut Wrench

is an extremely useful tool for working in confined corners and other places where a monkey wrench would be useless.

We also manufacture an adjustable "S" wrench for pipe work.
In both the nut and pipe wrenches, the operating nut is so placed as to make the wrench easily operated by the hand which holds it. The sliding jaw is provided with a full bearing on the frame when open to its widest capacity. The operating nut is steel and the sliding jaw a steel drop forging. All parts are interchangeable and are thoroughly hardened and tempered.

THE CELEBRATED

Dreadnought Milling File

A substitute for files which is revolutionizing file work

A great cost reducer.

A simple and radical improvement on the ordinary style of Hand Files.

It cuts from 300 to 500% faster than an ordinary file.

It is self cleaning.

It can be sharpened four times.

It cuts equally well all metals, also wood and marble.

Its cutting edge outlasts from five to ten ordinary files.

Although practically a rasp, it leaves the surface smooth.

N.B.—The Dreadnought is adaptable to every job in which ordinary files can be used, expediting the work and doing it better, and for numerous jobs usually milled in machines.

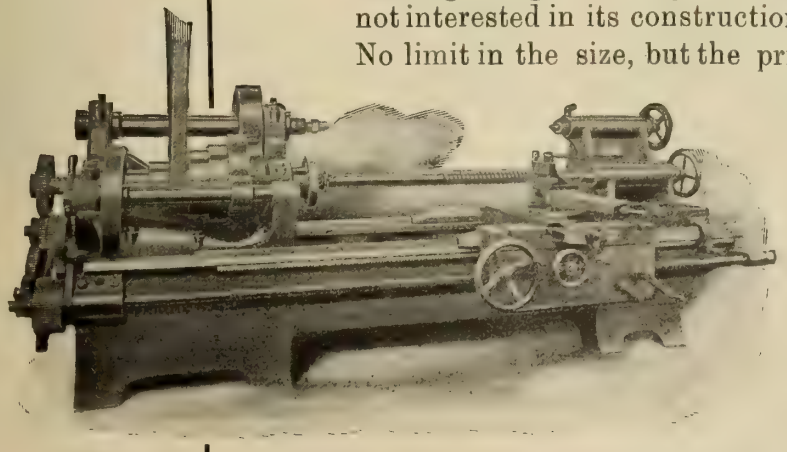
As far as your big Lathe goes—it will go no further than big work.

McCabe's "2-in-1" Lathe will go as far as you like—big or small. You always have a Lathe "loose" while one is working.

The chief business of McCabe's "2-in-1" Lathe is work, but if it has a working range twice greater than an ordinary style Lathe, are you not interested in its construction?

No limit in the size, but the price is away under the high figure you'd pay for other big Lathes.



Our convictions—in fact our intimate knowledge of the worth of this machine—tempt us to a more lengthy explanation—in the form of a book.

Write for it.

One refitted 24" traverse head.
One refitted 16" Smith & Mills.
One refitted 15" traverse head.
One new 7" Rhodes, hand or power.

MILLING MACHINES

One new No. 2 plain Cincinnati.
One refitted No. 2 plain Cincinnati
One refitted No. 3 F.E. Reed.
Two new No. 2 Fox, hand feed.
One refitted No. 1½ American hand feed.

BOLT AND PIPE MACHINES

One new 2" bolt cutter with Galt culver automatic head.
Two refitted 2" bolt cutters.
One refitted 1" Acme bolt cutter.
One rebuilt 2¼"-5" Curtis hand or power pipe machine.
One new 1"-4" McDougall pipe machine.
One refitted ¼"-2" Apex hand or power pipe machine.
One refitted ¼"-2" Jarecki hand or power pipe machine.
One nearly new ¼"-2" Borden hand pipe machine.

POWER PRESSES

Four new No. 21 power presses.
One new No. 20 power press.
Five new No. 19 power presses.
One new No. 18 power press.
One refitted Bliss stamping press.
One refitted London stamping press.
One refitted No. 4 punching press.
One refitted No. 2 Stiles & Parker
One refitted No. 2 Fowlers patent.

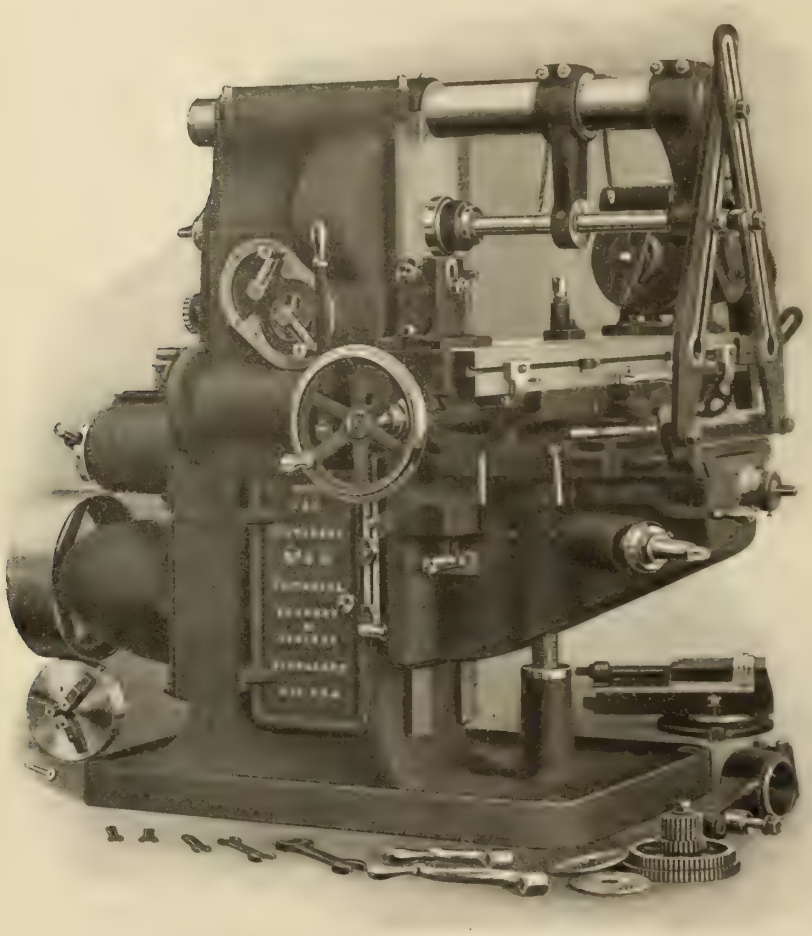
GRINDERS

One new cutter and reamer grinder with die chaser attachment.
One refitted No. 10 electric grinder.
One new No. 5 Prescott grinder.
One new No. 3 Prescott grinder.
Twenty new pedestal grinders.
Thirty new bench grinders.
One new No. 2 water tool grinder.
One refitted 2 wheel water tool grinder.

MISCELLANEOUS

One refitted 36" Gould & Eberhardt gear cutter.
One 87" plate bending rolls.
One No. 2 Newton cold saw.
One 18" Bremer punch and shear.
One No. 14 armor plate lever punch.
One 16" Globe tumbling barrel.
Two 2" cutting off machines.
One 5¼"x18" Bell steam hammer.
One No. 25 Bradley helve hammer.

H. W. PETRIE, Ltd., Toronto, Montreal, Vancouver



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

CINCINNATI

Verticals

HIGH POWER

Their unusual rigidity enables them to finish, at fast feeds, product of unexcelled accuracy. The pieces shown are 12″ x 36″—finished surface 2″ wide, gray iron.

FIRST METHOD

Cutter 12⅝″ dia. takes roughing cut, then feed is reversed and finishing cut .010″ deep is taken at 20″ feed. Two pieces laid together show less than (.00025″) one-quarter thousandth inch "out" in their length.

SECOND METHOD

A cutter 4″ diameter finishes the same pieces, using cross and table feeds alternately, at 20″ per minute. When laid together they show less than (.001″) one thousandth inch "out" anywhere on their surface.

This is everyday commercial milling. A less rigid machine could not possibly produce this accuracy nor do the work this fast.

36-inch Swing Engine Lathe (Triple Geared)

TOOL BUYERS! CONSIDER THIS FACT:

that the tool which costs least in the first place quite often turns out to be by far the most expensive in the long run. The great outstanding characteristic of

New Haven Tools

is their capacity for giving long, continuous and perfectly satisfactory service. New Haven Lathes, Planers and Slotters are warranted to embody every improvement which really adds to practical efficiency, but are minus any experimental features the practical utility of which has not been satisfactorily demonstrated. New Haven Lathes are made in 18 in., 21 in., 24 in., 28 in., 32 in., 36 in., 42 in., 50 in. and 60 in. swing, in even lengths to 36 ft., and the planers in 24 in., 28 in., 34 in., 40 in., 50 in. and 60 in. square, to plane from 6 ft. to 20 ft. : : : : : : : : : :

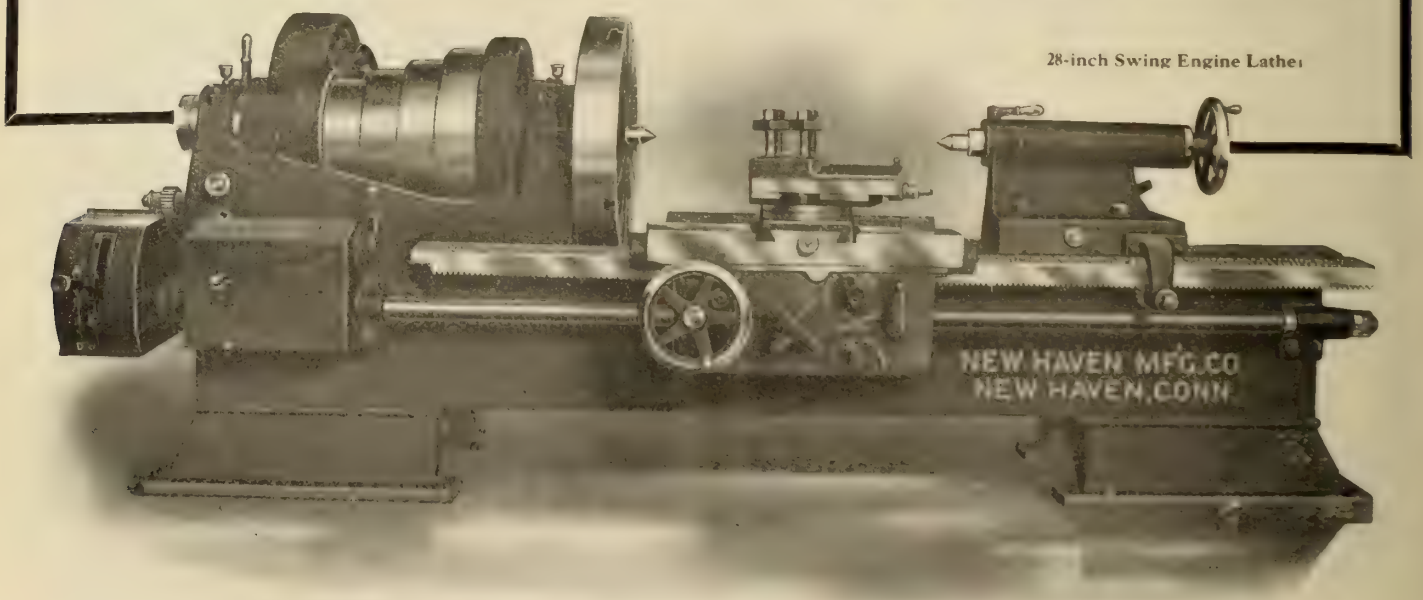
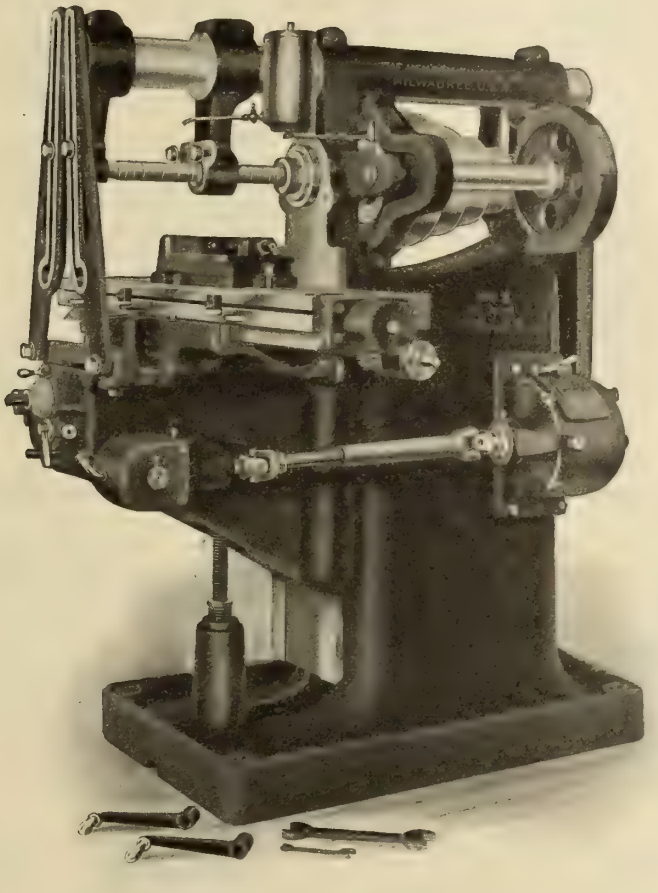
28-inch Swing Engine Lathe



KEMPSMITH MILLING MACHINES

are safe against careless or ignorant handling, and are built to withstand continuous rough usage and strain through effort for maximum production.



There is no weak, limiting point in the entire operating mechanism. In severe practice, and under prolonged exhaustive tests, the breaking point in sudden emergency has time and again proved to be an external taper pin—nothing easier to renew.

One lever controls all feeds. Table has positive trips.

One gear box provides all feed changes, any one obtainable while machine is operating under heavy cut. Impossible to throw in conflicting combination. It is full proof.

The whole operative machine is reliable and safe. This is of first importance in severe manufacturing, as well as in shops where milling machines may not as yet be fully understood.

BLOUNT'S NEW IMPROVED

Wet Tool Grinder

The Vertical Centrifugal Pump is of snail shell design, and the propeller is so loosely fitted that it does not touch the case at its nearest point. A sleeve cap covers the pump-case, loosely encircling the shaft, and extending to a point above the water line, which prevents leakage without the use of packing. The main bearings being long and self-oiling, the machine may be run constantly, thus saving all loss of time in stopping and starting. The hood is so perfectly placed that it prevents water from reaching the main bearings or flying upon the floor. Many other exclusive features. : : : : :

Derrer Oval Taper Drill Sockets

Give an Absolute Perfect Positive Drive

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others :

From one-third to one-half shorter.
No tangs to twist off.
No set screws or keys.
Positively no slipping or binding.
All our work interchangeable.
Absolutely true running drills.
Drill breakage reduced to a minimum.
Drill accounts reduced 25 to 50 per cent.
25 to 50 per cent. more work through your drill presses.
Chuck and socket account reduced 75 to 90 per cent.
A drill chuck or socket that is practically indestructible.
Gives an absolute perfect positive drive.

How Do You Figure Labor Cost?

Here is a clock system that automatically figures the labor cost on every operation of every job.

When the operator is given a piece of work a card is given him with the nature of the job written in the proper place. This card he then stamps on the clock and the exact time of commencement is recorded down to the decimal fraction of an hour.

When the work is completed the operator again stamps his card on the clock. The difference between the first stamping and the second indicates the exact amount of elapsed time taken by the operator to perform that particular piece of work.

By this simple system the elapsed time on several jobs performed by one operator may be shown on one ticket in card or bound booklet form as shown in the cut below.

The Canadian Appraisal Co.,
Montreal, Que.

Dear Sirs:-

We feel that in justice to you we should advise you that your appraisal was of invaluable assistance to us in adjusting the loss through the fire that took place on Dec. 24th. last and entirely destroyed our factory and plant.

Your figures were accepted without hesitation by the insurance adjustors and we were complimented upon the way in which we were able to prove the values of our buildings and machinery.

We could hardly write you a letter expressing too strongly our views on the matter of the necessity of an appraisal, and our recent experience has convinced us that we should in the future always have an up-to-date independent valuation of all our fixed assets, and we consider the fee paid you was one of the wisest outlays we ever made.

This letter is unsolicited and we would be glad to have you use us as a reference.

Yours truly,
THE SANDERSON-HAROLD CO. LTD

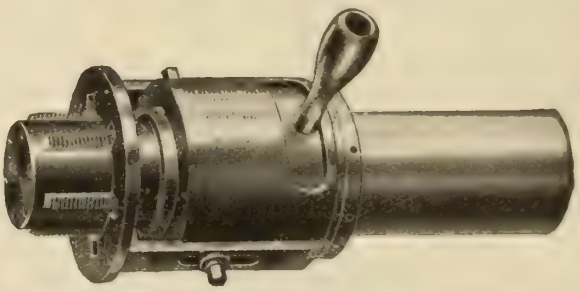
Double the Output in the Same Time



This is what the GEOMETRIC COLLAPSING PIPE TAPS give.

This is made possible from the fact that there is no backing out after the thread is cut, as the chasers are instantly collapsed when the desired depth of thread is tapped, and the tap is run out without touching the thread, which insures a very nice class of work.

These tools can be used on the drill press, screw machine, turret or engine lathe carriage.

Send samples or blue prints of your tapping and let us estimate on a suitable equipment of taps to cover your requirements.

The Process of the Destructive Distillation of Wood

New Plant at Donald, Ont., of Wood Products Co.—The Process of Manufacture, Buildings and Power Equipment—Instalation of Warren Gas Engine and Producer Gas Plant, using Charcoal Braise as Fuel.

The new plant recently completed at Donald, Ont., for the destructive distillation of wood, possesses some unique features of building construction, power plant and equipment that make it of general interest.

Donald is a small town on the G.T.R., north of Lindsay in Haliburton county, consisting of the cottages, store, hotel and works of the Wood Products Co. Fig. 1 is a general view of the works and Fig. 2 shows the general layout. In this plant a log of wood is transformed into block charcoal, wood alcohol, acetate of lime and tar, for strange as it may seem, these products are all contained in any good log of hardwood. The separating of them involves great expense, intricate mechanical equipment and a wealth of skilled labor.

The primary purpose of the factory is the production of charcoal. The raw material used is hardwood. The wood is obtained in the large limits around Donald and several camps of wood choppers are kept employed continuously, the plant requiring about 50 cords daily.

The wood is piled in the yards as shown in Fig. 1. From there it is taken to the oven house shown in Fig. 2, and it is here that the process begins. The cord wood is loaded in 24 cars, each holding two cords, and three of these cars are rolled into each oven. In these ovens, the temperature is kept constant at about 750 degrees F. This intense heat necessary to bring about this temperature is generated beneath the level of the ground, and under firebrick arches, the fuel consisting of mill refuse and wood gas. The cars are run into the ovens, the doors are hermetically sealed and the baking process begins. After being subjected to this heat for about eight hours, the gases begin to form and the wood undergoes a distinct chemical change.

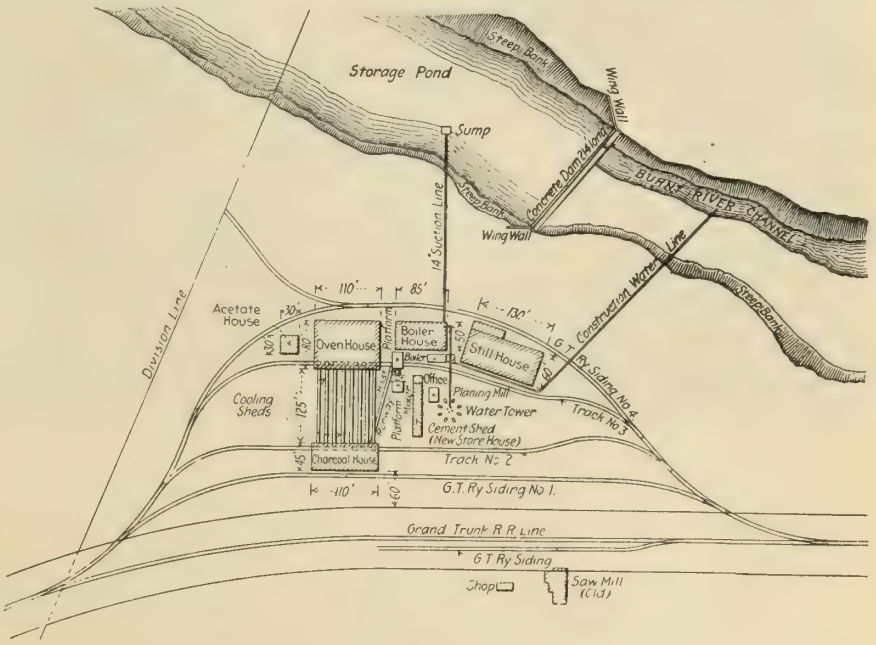

Fig. 2.—General Layout of the Wood Distillation Plant.

The gases pass out through copper pipes into copper condensers. A liquid is formed consisting of pyroligneous acid and tar, whitish in color with streaks of brown indicating the presence of tar. This liquid is run into tanks and the non-condensible vapor, known as wood gas, is conveyed to the oven fire through long pipes, where it is used as fuel

The liquid consisting of alcohol, tar and acid is pumped to the Still House. In this building the process of refining is carried on. The pyroligneous acid is freed from the tar which is stored in a tank and used as fuel. The pyroligneous acid is now carried through an arrangement of machinery to the "Lime Lee" still, where, in contact with lime, the acid of the liquid is neutralized and a compound, acetate of lime is formed. This forms the basis of smokeless powder and has a wide market.

When the remaining liquid leaves the lime lee, it is still a combination of alcohol, oil, water and a few impurities,

Fig. 1.—General View of Works, Showing Dam in the Foreground.

the alcohol being about 15 per cent. strong. It is then run through the 80 per cent. still where its strength is brought up to almost absolute purity The alcohol, when taken from the tanks, is placed in large barrels, lined with glue to preserve the contents. The alcohol purified, is used in the manufacture of fine shellacs and gums. The series of copper tanks and stills are shown in Fig. 7.

Returning to the acetate of lime, it is taken from the tanks to the drying rooms above the ovens and the heat of the ovens is used making a very economical arrangement. There are 10 000 lbs. acetate produced each day and placed in bags for shipment.

After roasting twenty-four hours the cars are drawn by a vertical electric windlass arrangement to a second air tight compartment where it is left another twenty-four hours. This is repeated in a third air-tight enclosure for another twenty-four hour period. The cars of charcoal are then left in the yard for a day when it is screened and loaded automatically in box cars for shipment.

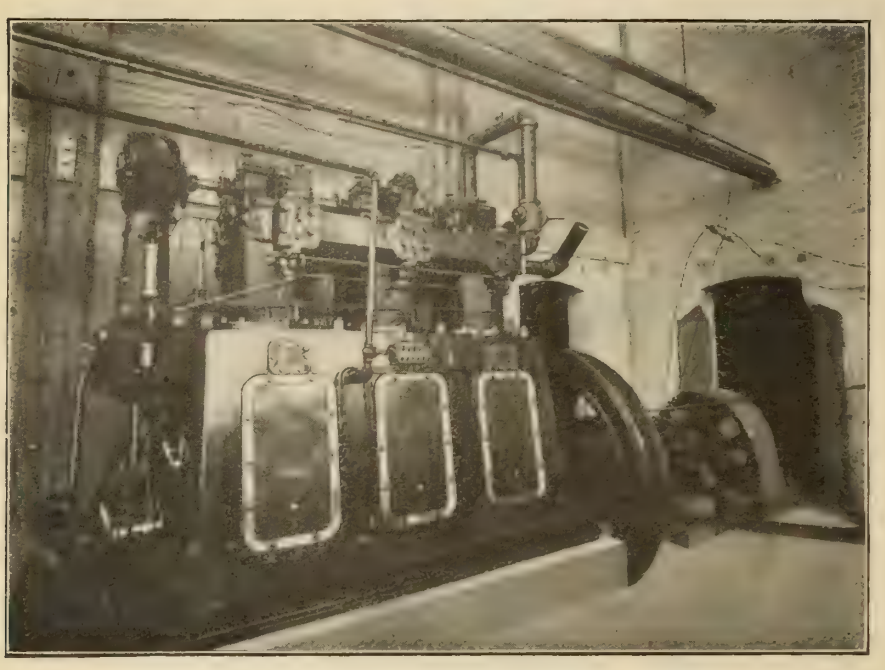

Fig. 4.—Warren Gas Engine Direct Connected to Generator.

The Power Plant.

One of the economical points in regard to gas producer plants is the quality of fuel which may be used to generate gas. The Warren plant installed in the works of The Wood Products Co. by W. H. Oliver & Co., Toronto, is unique in this respect. The waste charcoal that would otherwise be a loss is turned into power, the generated gas driving a three cylinder 125 h.p. engine, direct connected to a Canadian General Electric generator and belt connected to a John Inglis triple acting pump.

The layout of the engine room is shown in Fig. 3. The equipment consists of the three cylinder 125 H.P. Warren gas engine and C. G. E. generator. John Inglis 1,500 gallon pump, 1,000 gallon Blake pump, 18x10x20 and 70 R.P.M., supplied by R. H. Buchanan, Montreal, motor for running small Rand air compressor. A gasolene engine is also connected to the air compressor countershaft so that air pressure may be secured to start the engine. A one panel C. G. E. switchboard contains the necessary switches, D. C. voltmeter and D. C. ammeter.

A concrete dam 214 ft. long has been

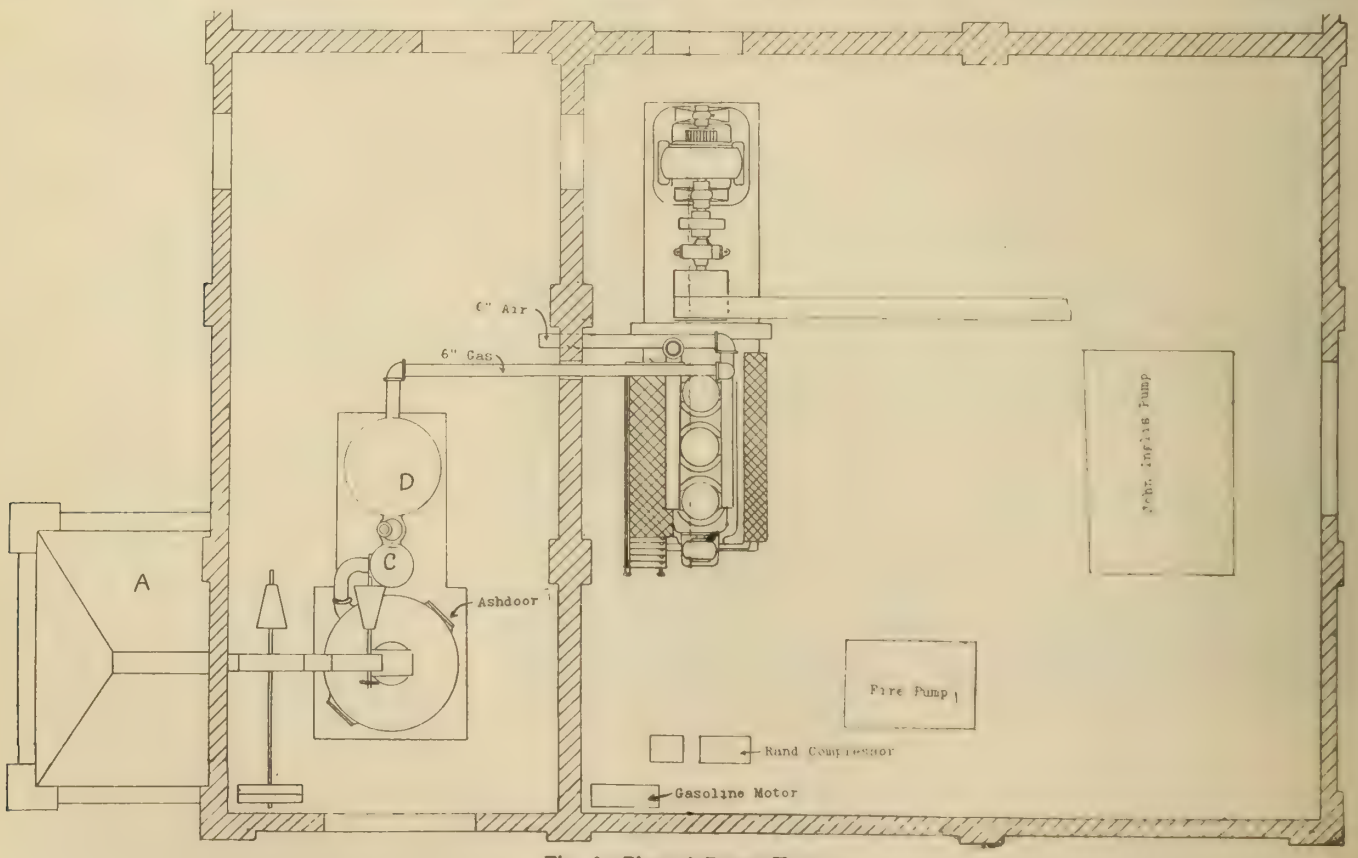

Fig. 3.—Plan of Power House.

built across the Burnt River to ensure a water supply throughout the year. This dam is shown in the foreground of Fig. 1. This view shows also a 50,000 gallon water tower which is 93 ft. high, both stand and tank being constructed of concrete.

A pan shown at B, fig 4 contains water and generates steam. When the gas is produced it is led through C, fig 3, where there is a spray of water. This economizer contains a number of baffle plates and the sprayed water drips from one to the other. The air is regulated by means of a damper in the bottom of C. The steam and air mix in the producer, go up through the fire, down an independent passage in economizer C, through a purge valve into D which contains coke and water which is sprayed in from the top. The top of D, for about two feet is filled with excelsior which removes the tar from the gas. A tar extractor is placed in the gas pipe between the producer and engine to remove any tar not taken out by the excelsior.

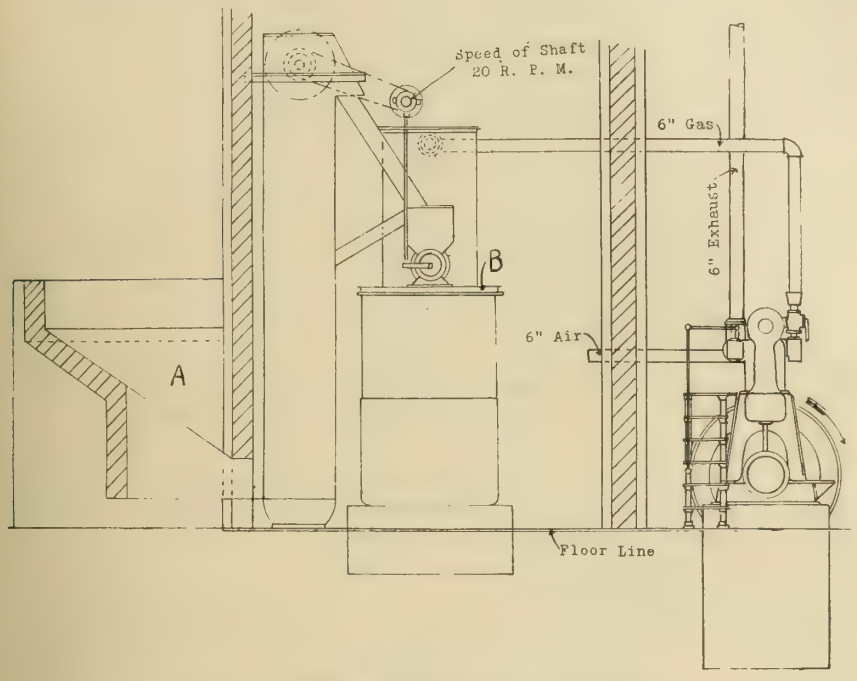

Fig. 5.—Elevation Showing Pipe Connections.

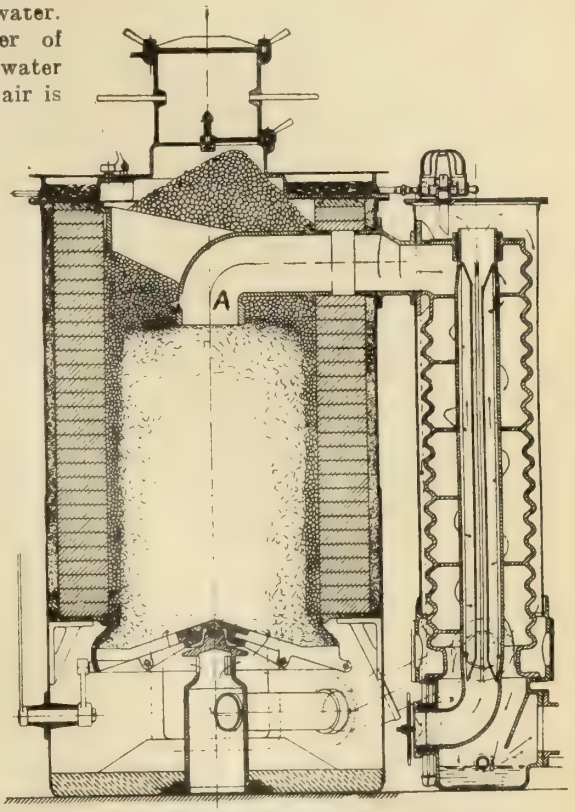

Fig. 6.—Section of Warren Producer.

The Boiler Room.

The boiler house is 52x90 ft., one story high, with a monitor roof. A battery of four 150 H.P. boilers, supplied by John Inglis, supplies the steam required for the plant. The fuel is the soft and refuse hard wood from the neighboring limits, also large quantities of marsh gas and wood tar driven off from the retorts during the destructive distillation process.

The tar is pumped from the still house and blown in under the boilers by a steam jet. All water is condensed, collected and used in the boiler again.

The boilers are located in the north end of the boiler house, large wood storage space is in front of the boilers and large openings are provided in the boiler house walls to pass the wood through. These openings are closed with rolling steel shutters.

The Gas Producer.

At the side of the boiler-room is the power and producer gas room. The charcoal braise, the fuel used in the producer, is stored in a reinforced concrete bin at the side of the producer gas room, showed at A in Fig. 3. The producer is suction type.

The charcoal is fed automatically into the producer. The feed is regulated and if a greater amount than is required it is returned to the storage bin.

The Engine.

Fig. 4 gives a good view of the engine direct-connected to the generator. The engine and plant was made by Struthers Wells Co., Warren, Pa., and installed by their Canadian agents, W. H. Oliver & Co. The engine is a three cylinder one. On account of the continuous process in a wood products plant the engine must run without any stops. A valve may be removed and

Fig. 4.—Interior View of Still House.

replaced in one cylinder while the other two carry on the work.

The cylinder of the engine is designed to prevent any water leaking into the explosion chamber, yet it permits expansion of the inner wall without throwing any stress on the casting.

The cylinder wall of the engine is lubricated by a Warren force feed system. The main bearings and cam shaft bearings are ring oiling. The wrist pin bearing is lubricated through the medium of a tube, fitted with a ball check valve. The tube on the downward stroke of the piston enters the oil receptacle and the oil is forced to the wrist pin bearing. The bearing is of ample size and adjustable.

The crankcase forms the outer wall of the water jacket at the lower portion of the cylinder, thus providing effectual cooling for the cylinder at the lowest portion of the stroke.

The point of ignition can be varied while the engine is operating. The method of governing and the construction of the valve cages, the location of the cam set on the top of the cylinder, where it is readily accessible, are features of up-to-date practice in gas engine design.

The whole plant including instalation of power equipment, and construction was carried on under the supervision of William H. Oliver, C.E., Toronto, with J. M. Wilson, C.E., as assistant. Pitt & Co., Niagara Falls, had the contract for the concrete work.

The officers of the company are: J. A. Kammern, President; R. A. Oliver, after whom the town is named, Secretary-Treasurer, and W H. Oliver, General Manager. James Montgomery is Superintendent.

The Method of Cutting Parallel-Depth Bevel Gears

Gears of Parallel-depth are now being used for Machine Tools with Good results. Method of Laying Them Out and Method of Cutting Them.

A type of bevel gears with parallel depth and many advantages, is being used by the London Machine Tool Co., Hamilton. They are giving good results and in a test were speed up to 700 r.p.m. These gears are laid off from the front on small end of the tooth. With this design there is a small slippage but it is so very small that it can be neglected. This method is a money-saver where bevel gears are to be cut.

The making of bevel gears with parallel depth is not new but is not very widely used, nor is it very well known. Two writers in the American Machinist of recent date have explained very fully the method of laying out and cutting gears with parallel depth teeth and the following description of these methods is taken from their article.

By this plan of producing bevel gears, special cutters are not needed; ordinary stock cutters used for spur gears answer every purpose, and produce far better results. Besides, not needing special cutters, the length of the tooth is not limited, as almost any length of tooth within reasonable limits, can be cut. The teeth of the pair of gears match perfectly without the necessity of filing or rounding off on top, as required by the old method, as the cutter leaves them in proper shape. Also, there is absolutely no guessing about the matter; everything is determined beforehand and the gear is produced without any cut and try, and with the positive certainty that it will be right when finished.

In using this plan the number of teeth are calculated on the inner or smaller pitch circle, or having a required number of teeth, the pitch diameter is calculated for the inner pitch circle, selecting a pitch that will be of suitable strength for the work to be done, always bearing in mind that the teeth of bevel gears produced by this plan will be several times as strong as those made by the usual method because the tooth grows thicker towards the larger diameter. Thus a finer pitch should be selected than would be for a spur gear to transmit the same power in order to make a better proportioned gear.

Laying Out the Gears.

Having determined the pitch and number of teeth for both wheel and pinion, lay out the pitch and circle of the wheel A, Fig. 1. Draw the line B and at right angles thereto lines C and D; on the line C draw the pitch circle E; draw the line F through the centre of E; then through the intersection of F and D, and G, H and I draw pitch—cone lines J and K. Then the angles L and M will be the proper setting for the dividing head, and also, be the angles to turn the gear blanks for the tops of the teeth. The diameter is plus one part of pitch above the pitch line as at O O and P P. Now draw the back-cone lines R and S. Twice the distance of R, in inches, will be the pitch diameter of a spur gear, the number of teeth of which should be used to select the proper cutter for the wheel; twice the distance S in inches, will be the pitch diameter of a spur gear, the number of teeth of which should be used to select the proper cutter for the pinion.

It will also be noted that the top and bottom of the teeth are parallel with the pitch line as in a spur gear. This angle is also the correct setting of the dividing head when cutting the gear, the bottom angle is the same as the angle of the pitch cone. The teeth can be produced by two cuts, and will give good results on pitches up to, say, 6-pitch. It is better in cutting coarser pitches to first cut the teeth through straight on the centre; then set over sidewise, first for one side of the teeth, then for the other side, and finish the teeth with three cuts. The proper amount to set over sidewise is always just one-half the thickness of the cutter at the pitch line, each side of the centre, because the contact or working

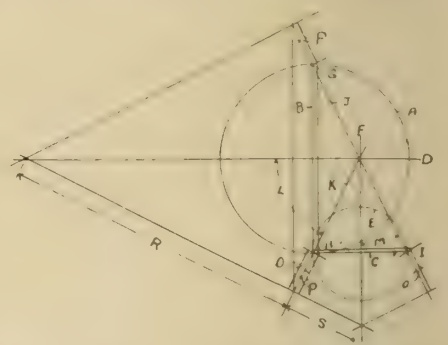

Fig. 1.—Layout of a Set of Parallel-Depth Bevel Gears.

surfaces of the teeth of bevel gears must converge at the point where the axes of the shafts meet—excepting skew bevels—and by setting over sidewise one-half the thickness of the cutter at pitch line, the side of the cutter at the pitch line is brought over the centre line of the gear, and, of course, will cut the side of the tooth so that if it were continued it would meet the point where the axes of the shaft meet; but it is not necessary that the line of the tops and bottoms of the teeth meet at the same point. In other words, the gears are two cones whose contact surfaces are the pitch line, or pitch cones; the teeth are formed partly above this surface and partly below it. It is not necessary in a practical working gear that the tops and bottoms of the teeth converge at the vertex of the cone, but may be made parallel to the pitch line at O O and P P, Fig. 1. But the sides of the teeth must meet at the vertex as at M M Fig. 2.

Having set over one-half the thickness

of the cutter, rotate the gear until the cutter will just come into the cut at the inner circle without touching either side, ccarry the cutter through, then set over in the opposite direction one-half the thickness of the cutter as before,

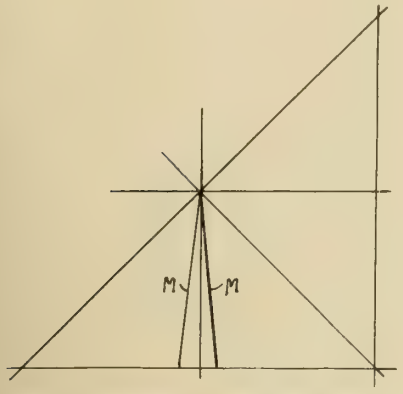

Fig. 2.—Diagram of Sides of Teeth.

turn the gear back until the cutter will come into cut as for the other side and carry the cut through on this side of the tooth, thus finishing one tooth space. Now, without changing the setting, cut the rest of the teeth around the gear, then set back to the setting for the first side of the tooth and go around the gear again, cutting the other side of the teeth; this will complete the gear with two cuts to each tooth, and if the work has been carefully done, the gears will be finished, and require no refiling or doctoring of any kind. They may be put into service at once.

The lathe work on the blanks needs to be good, machine work; being careful that the face angles are correct, as this is the only angle of importance. This face angle will also check the setting of the dividing head on the milling machine, as the cutter should just touch across the face, as in cutting spur gears. Or, assuming that the dividing head is

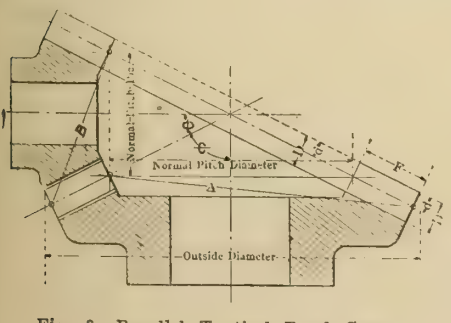

Fig. 3.—Parallel Toothed Bevel Gears.

set to the correct angle, this will check the correctness of the lathe work. This ability to check lathe work against milling work, and milling-machine work against lathe work, insures against making any mistakes in cutting an improperly turned blank. There is no good reason for any mistake or failure to produce by this method any bevel gear wanted, positively and accurately from start to finish; all the work is predetermined with the some certainty as the production of spur gears. S. K. Allen describes a pair of these gears which ran very smoothly. The real difference between these gears and the usual bevel gear consist in two things: 1, the normal pitch diameter is located at the inner end of the teeth instead of at the outer; 2, the centre angle, face angle and the cutting angle are identical. This gives a tooth of standard height at all places (whence the name "parallel tooth gears") and a very strong tooth, for, as the thickness of the teeth on the pitch line is standard at the normal pitch diameter and the height is standard at all places, it follows that the thickness is greater than standard at all places outside of the normal pitch diameter; hence there is a thick strong tooth. Referring to Fig. 3, the normal pitch diameter is the starting point when laying out these gears. It is equal to the pitch diameter of a spur gear of the same number of teeth and pitch; D and d are the same as a spur gear with standard teeth of the same pitch.

Cutting the Gear.

To cut use the same cutter as for spur gear of diameter A, or A x P equals the number of teeth in a spur gear of diameter A. Select a cutter suitable for a spur gear with the number of teeth thus found. The cutter for the pinion must be selected by the same method from dimension B. The angle may be found the same as for any bevel gear; namely,

$$\text{Tang. } O = \frac{\text{teeth in gear}}{\text{teeth in pinion}}$$

The pinion angle O = 90 deg.—O when the shafts are at right angles.

O D =(normal P D) + (2 F sin. O) + (2 D cos. O) for the gear. The pinion outside diameter may be found by the same formula by substituting the pinion angle O.

To cut the gears on any universal milling machine it is necessary to cut three times around the gear, as follows: 1st cut, place the cutter on centre and cut straight through the gear at the given angle; 2nd cut, move the table toward the spindle one-half the thickness of a standard tooth, then roll the gear away from the spindle one-fourth as many holes as are used altogether to space between teeth and cut through; 3rd cut, move the table away from the spindle the full thickness of a standard tooth, then roll the gear toward the spindle one-half as many holes as are used altogether and cut through. This finishes the gears complete, ready for use.

PERSONAL NOTES.

John M. Wilson, C.E., of the engineering firm of W. H. Oliver & Co., Toronto, was married on April 22 to Miss Luta A. Welch, daughter of Ald. Welch, Toronto. Mr. and Mrs. Wilson are spending their honeymoon in New Orleans and Pas Christian on the Gulf of Mexico. Mr. Wilson is a graduate of the S.P.S., Toronto, and has been associated with W. H. Oliver & Co. for some time.

The Dominion Rifle Association has recently made a very popular selection in appointing Lt.-Col. Bertram to command

LIEUT.-COL. BERTRAM.

the Canadian Bislev team this season. Colonel Bertram has been very active for many years in Canadian military affairs and very well deserves the honor of such an appointment. He is very well and favorably known to the iron and steel trades in Canada owing to his active connection and membership in the John Bertram & Sons Co., Dundas, Ont., machine tool manufacturers.

The board of management for the Canadian Government railways which includes the Intercolonial Railway, and the Prince Edward Island Railway Systems, consists of M. J. Butler, deputy minister and chief engineer of the Department of Railways and Canals, as chairman of the board, D. Pottinger, the present general manager; E. Tiffin, now general traffic manager, and F. P. Brady, of Montreal.

The Electric Furnace in the Iron and Steel Industries

The Results of Experiments Carried on at Niagara Falls, Canada, by the American Furnace Co., Showing the Possibilities of the Electric Furnace.

By T. ROWLANDS*

The induction furnace has opened a field for electric furnace work in the iron and steel industries, which heretofore has been little exploited. This field comprises the melting of metals, such as iron, steel or brass for casting purposes, and the induction furnace offers great advantages in this field. A great advantage of the induction furnaces for work of this character is the absolute control of the quality of the metal from which the castings are made. The construction of the furnace is such that no impurities are introduced into the metal during the melting process, and, therefore, by charging the furnace with metal of a known analysis, it is reasonably sure that castings will be obtained of a predetermined composition. A consideration of the construction of the furnace will make evident the reasons for these statements.

In Fig. 1 are shown plan and sectional views of a Kjellin induction furnace, as installed at a demonstration plant built by the American Electric Furnace Co., of 45 Wall Street, New York, at Niagara Falls, Ont. This company, which controls the Kjellin, Colby and other induction furnace patents erected a demonstration plant at Niagara Falls, Ont., equipping it with a 10 to 20 kilowatt laboratory type, a 40-60-kilowatt experimental type, and o 100 to 150-kilowatt small commercial type steel furnace. In addition to the furnaces, there are suitable casting arrangements, such as ladles, ingot molds, etc.

The induction furnace is in effect a transformer, in which the bath of metal to be melted forms the secondary. The metal being operated on is in a circular trough or annular crucible as shown. A laminated core on which is wound a coil of wire forming the primary is placed concentric with the circular trough. A laminated yoke connects the two extremities of the core passing over behind and below the trough, as shown. Alternating current being led into the primary coil, a current is induced in the metal in the trough This current has the effect of heating the metal, and there

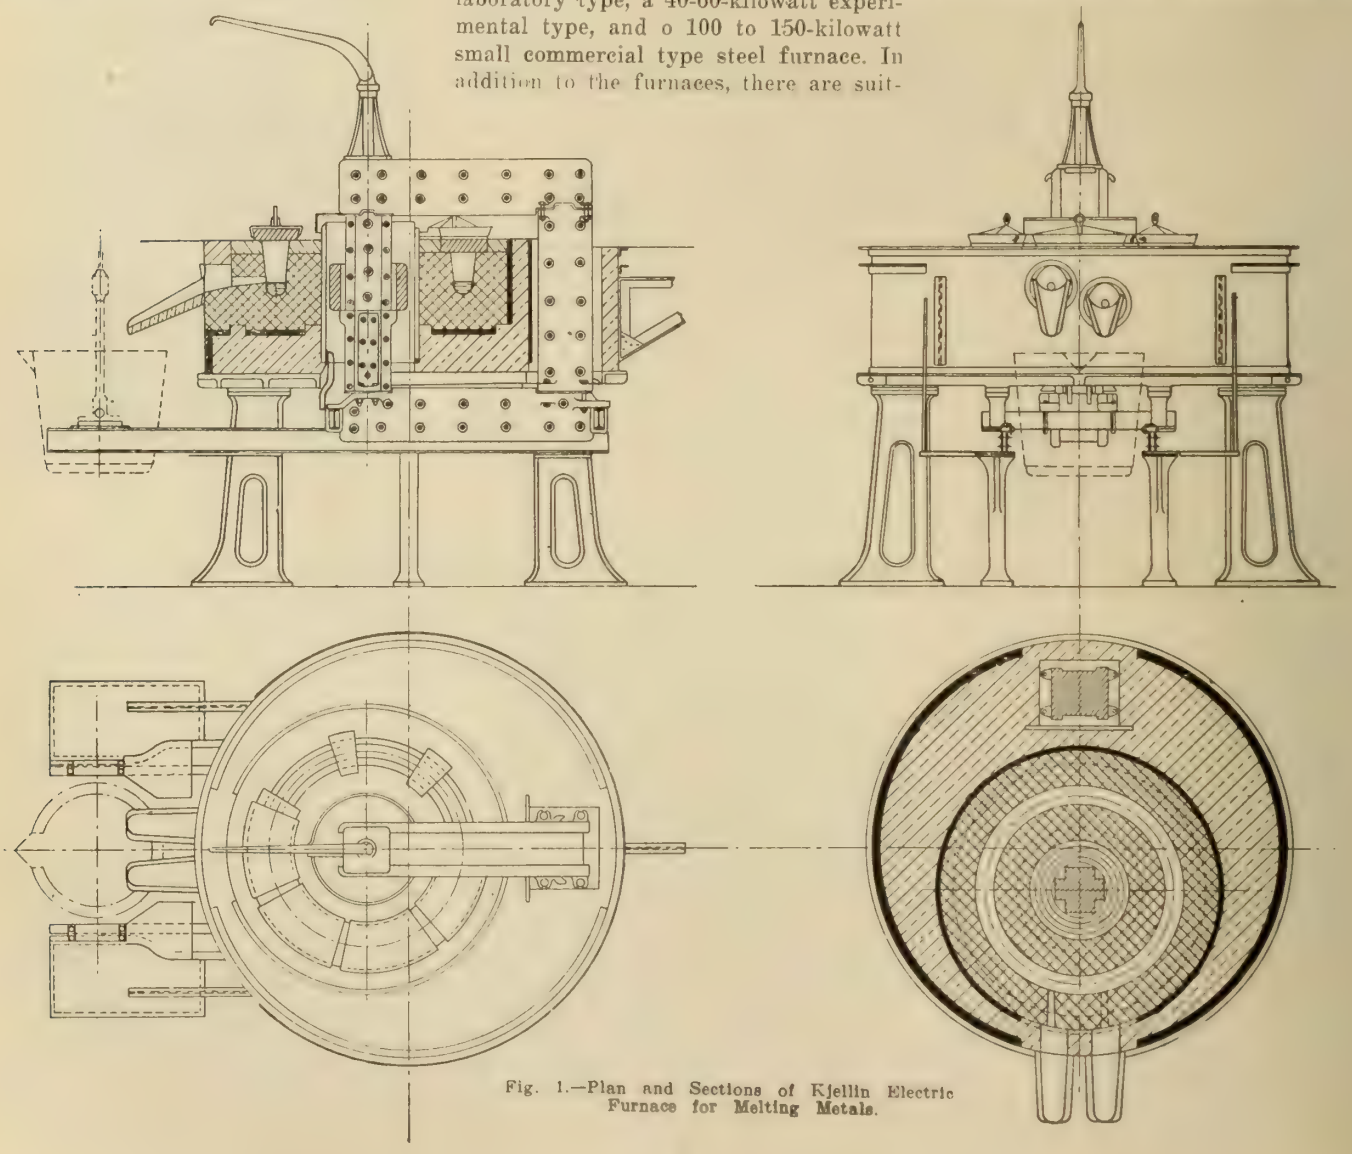

Fig. 1.—Plan and Sections of Kjellin Electric Furnace for Melting Metals.

* Manager American Electric Furnace Co., Niagara Falls, Canada.

being no escape for the heat, the metal is rapidly fused and soon attains a liquid condition. The lining of the trough is magnesite or dolomite, although any suitable refractory could be used, if it were desired to undertake a refining action in the furnace. For purposes of melting, however, and for accurate control of the quality of the metal, an absolutely neutral lining is essential. At the Niagara Falls plant, magnesite, which is of course basic, is used.

The Niagara Falls instalation uses, in connection with the 150-kilowatt furnace, a transformer which steps the line voltage obtained from the Canadian Niagara Power Co., down to a normal potential of 525 volts. In series with the transformer are an induction regulator and a 5-point contact connected to taps from the primary coil of the transformer, by which the voltage of the secondary of the transformer may be varied from 475 to 600 volts. The secondary of the transformer is connected to the induction furnace, and by varying the voltage in the primary of the latter, a greater or less current can be obtained to meet the varying demands, according to the condition of the bath in the furnace. The current obtained from the power company is on the 3-phase system and a synchronous motor is connected up to one of the legs of the circuit, in order to raise the power factor of the system. With the synchronous motor in operation the power factor has been raised to over 80 when using the induction regulator. With the motor not running the power factor runs along between 60 and 70 per cent. The curve, shown in Fig. 4, is on a run when regulator was cut out.

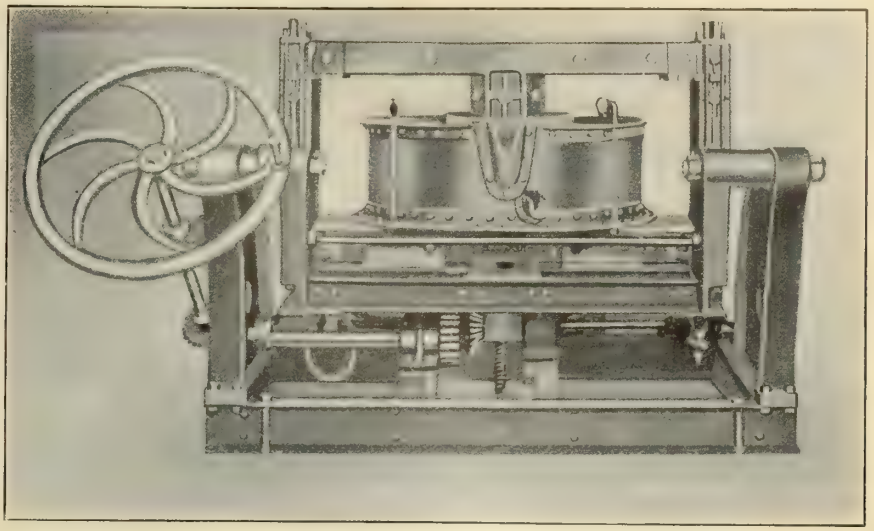

Fig. 3.—Five-Ton Kjellin Electric Furnace at Niagara Falls.

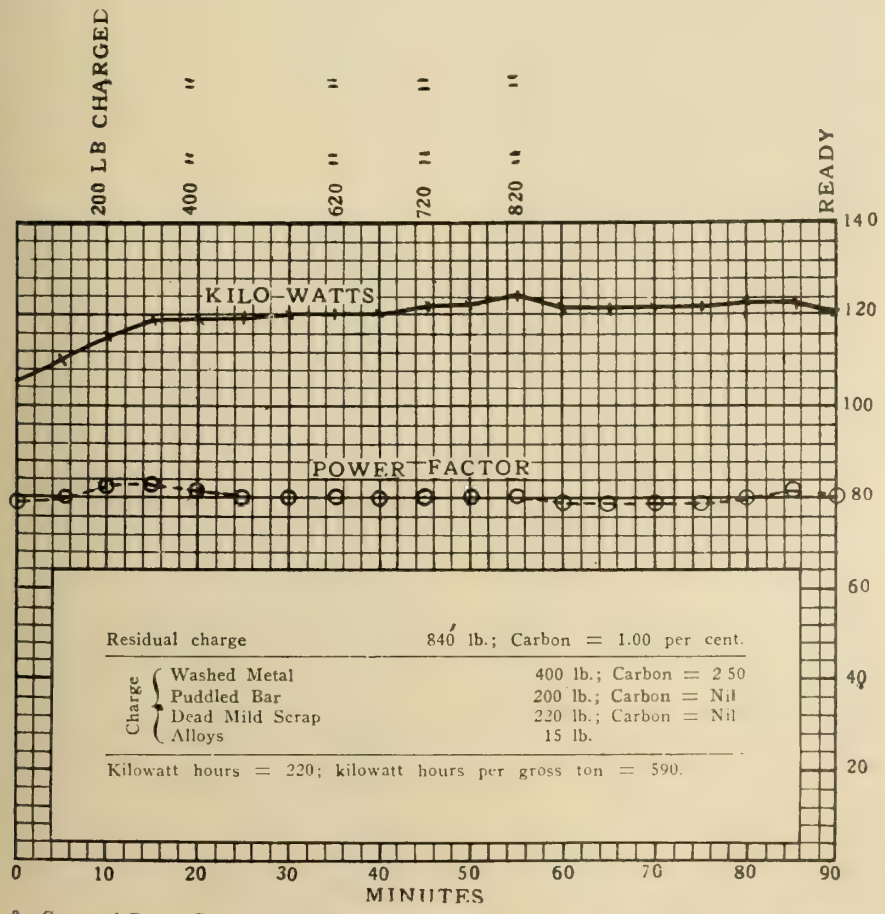

Fig. 2.—Curve of Power Consumption and Power Factor of a run of the Kjellin Furnace at Niagara Falls.

of the furnace that, as the trough containing the metal is covered, there can be little oxidation of the metal in the bath. A little lime is introduced with the metal, in order to form a protecting slag, and to keep the metal from contact with such air as may be in the trough. It is also evident that as there are no impurities to be introduced from carbon or other electrodes and that inasmuch as the lining is neutral, the quality of the molten metal must remain practically the same as the original charge. It is this fact which gives the induction furnace its wide openings for the manufacture of castings, and enables it to conform to the most rigid specifications. If a casting is required containing a certain percentage of silicon, and not over a certain percentage of phosphorus and sulphur these specifications can easily be met by charging the furnace with pig iron containing the required, or less than the required, percentage of silicon and phosphorus and sulphur, which are within the limits of the specifications. Inasmuch as no phosphorus or sulphur can be introduced during the process of melting, and as the silicon content can be brought up to the required point by the addition of the proper quantity of ferro-silicon, either in the ladle or the furnace itself, there is no difficulty in making castings of the required analysis. The same remarks apply with equal or greater force to brass melting. At Niagara Falls there has been produced several tons of high silicon steel from the magnesite lining by making ferro-silicon additions to the ladle. The iron was practically carbonless. Great care must, however, be taken to attain these results.

In melting brass by the induction furnace the melting trough may be luted

down, excluding all air and reducing the chance for oxidation of zinc to a minimum, and the temperature is under perfect control, by means of variation in the current in the primary coil.

In steel melting, the Kjellin-Colby furnace is only intended for melting high-grade steels, such as are usually produced in the crucible. It is not intended to compete with the open-hearth or Bessemer process, inasmuch as no refining is attempted, and the quality of the finished steel depends entirely on the material charged. When carrying out demonstrations at Niagara Falls, it has been the practice to use muck bar, washed metal and Swedish white iron. Other metals have been used in connection with special demonstrations, as old rails, boiler plate scrap etc., and in still other cases, alloy steels have been made and cast into ingots and green sand molds. In operating the furnace, the process is of the continuous character. About two-thirds of the bath is drawn off at each cast and the raw material charged into the molten metal remaining in the furnace.

In drying out a new lining, which is made from magnesite two rings of cast iron of high quality are used. These are gradually brought up to their melting point, a suitable pyrometer being used to enable the temperature to be governed accurately. The time consumed ranges from 60 to 70 hours.

As instances of the performance of the furnace, where the residual bath was about 850 pounds, 910 pounds were charged and melted in 68 minutes and poured in 1 hour and 30 minutes. The power consumption was equivalent to 440 kilowatt-hours per gross ton. In another case, in which low carbon steel was melted, the charge was 1,000 pounds and the power consumption was 560 kilowatt-hours per gross ton.

Another advantage offered by the electric furnace in melting metal for casting purposes is the fact that it is unnecessary to entirely drain the furnace at the end of the day's run. If the last cast does not require all the metal which has been charged to the furnace it is entirely feasible to allow it to remain in the crucible until the next day, merely leaving enough current in the furnace to prevent the metal from freezing.

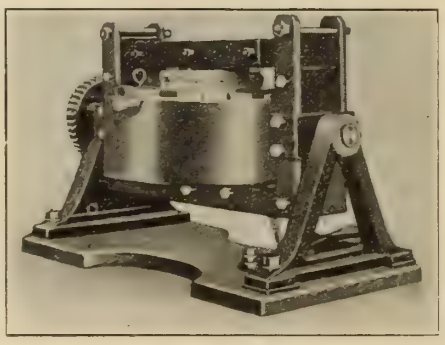

Fig. 4.—Laboratory Type Kjellin Furnace for Universities.

As to the cost of melting in the electric furnace, it naturally depends upon the price at which electric current can be obtained. At Niagara Falls one man can look after the small furnace installed without any assistance. The number of men about the plant depends on the equipment, but for furnaces where ingots only are cast, and adequate arrangements are made for handling the metal, two men and one boy per turn should be amply sufficient for all requirements. The lining of the furnace lasts from four to eight weeks, according to the size of the furnace and the quality of the material melted.

The following table illustrates the enormous saving in the reduction of steel:

Basing the power consumption at about 750 kilowatt-hours per ton, the cost of melting would be at a charge for current of one-half cent per kilowatt-hour:

750 kilowatt-hours at 0.5	$3.75
Lining, per ton	1.00
Total	$4.75

According to high authority, the life of a crucible is about seven rounds, sometimes more, but generally less, and coal used per ton of steel, about 2,650

2,650 pounds	$ 3.00
Crucible upkeep	8.00
Total	$11.00

The wastage with this process does not amount to over 2 per cent. The illustration Fig. 2, is a typical curve of power consumption and power factor of a test run in a furnace at Niagara Falls. The various steps in the process are clearly shown, together with the total energy consumption and the time of each operation. The lower curve shows the power factor, which, it will be noted, dropped as the charge was reduced to a liquid. As the factors entering into the current consumption are all given in the curves the cost of operating a furnace of this type can be estimated wherever the cost of energy is known.

In another test the furnace started with a residual bath of about 850 pounds and the voltage on the primary was 580 volts. The requisite metal was then charged, comprising 450 pounds of muck bar and 450 pounds of washed metal. The voltage on the primary was lowered to 475 volts after the charge was completely melted, which required about 68 minutes. The slag was then removed, extra care being taken, as an alloy had to be added to the ladle to produce a special steel, the time consumed being 10 minutes, after which the voltage was again raised and ferro-manganese and ferro-silicon added. From the time of starting to add the alloys until the first cast, 450 pounds, was made, 12 minutes elapsed. There was an interval of 3 minutes between the first and second casts, to permit of adjustment of the electrical apparatus, when no current was on, and then current was on for 7 minutes while preparing the ladle for the second cast.

The regular spring meeting of this association will be held at Milwaukee, Wis., on May 25 and 26. The headquarters will be at the Plankington, Wis.

Monel Metal: A Natural Alloy of Nickel and Copper

A Brief Description of the Properties of this Metal—Interesting as to its Possibilities in the Future of Engineering—Results of Tests.

By W. E. D. WILKES, B.Sc.

At a meeting of the Mining Section of the Canadian Society of Civil Engineers, held in the society's lecture room, Montreal, on Thursday evening April 1, the first authorized announcement, to any body of engineers, was made concerning the development of a new alloy, known as monel metal.

In introducing the subject Dr. J. B. Porter spoke briefly on the general properties of the metal, calling attention to the possibilities of its use. He was followed by Dr. A. Stansfield, who read a paper on the metallurgy of the metal, explaining the process of reduction from the ores and the results of chemical analysis made on samples obtained from the producers. The second paper, dealing with the physical properties and results of tests, was read by Prof. E Brown, of the Canadian Copper Company, who exhibited test samples showing the condition of cast, rolled, annealed and unannealed pieces at the point of fracture, etc.

This metal was first "discovered" nearly four years ago by the Canadian

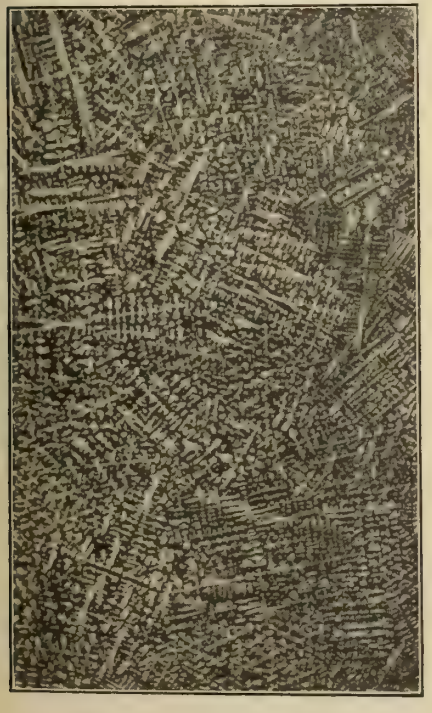

Fig. 1.—Cast Metal 15 Diams.

Copper Company's metallurgists while endeavoring to avoid the necessity of separating the nickel from the copper as found in the ores of their Sudbury mines. They found that the alloy obtained by reducing these metals to-

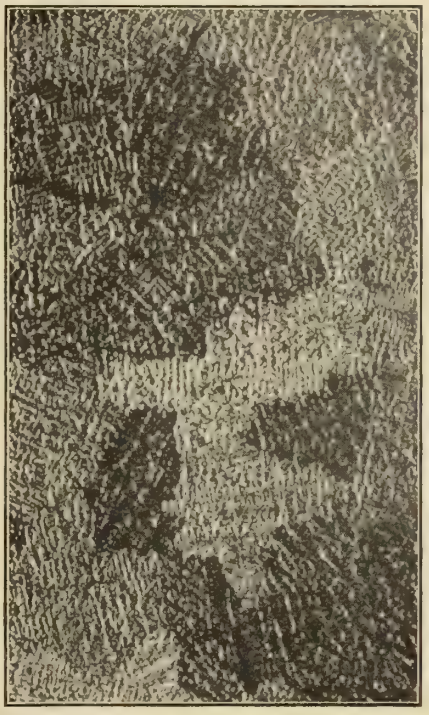

Fig. 2.—Light and Dark Parts Show Size of Crystalline Grains.

gether, merely removing the iron, sulphur and gangue matter from the ore, possessed many valuable properties, having the strength of steel with greater ductility, and the freedom from corrosion of nickel itself.

Monel metal, which was named after Mr. Ambrose Monell, president of the International Nickel Co., is a combination of nickel and copper in proportions, very approximately as they occur in the ores. These proportions are 68 to 72 per cent. nickel to 25 to 29 per cent. copper. The alloy also contains a little iron, about 2 per cent., and slight traces of sulphur and carbon. The melting point of the metal is approximately 1350 deg. C.; the specific gravity of the cast metal is from 8.86 to 8.87, while that of the rolled is 8.94 to 8.95. It is easily rolled at temperatures of from 900 degrees to 1,200 degrees C. and can be finished hard or soft similar to sheet copper.

In appearance the metal is a silver-white and is easily polished to a high finish and this finish will remain almost indefinitely. Its non-corrodibility, has been demonstrated by a 56-day test with 40 degrees sulphuric acid, which produced no loss whatever. This test was made with specimens of rolled metal which had been coated with oxide by merely heating.

Easily Drawn or Cast.

The metal may be as easily drawn and cast as it is rolled and among the possible uses of the hot-rolled, appear such as roofing, ventilators, smoke stacks ship plates, etc., the cold rolled sheets being used in making hospital equipment, watch cases knives, forks, spoons, etc.

For castings which are subject to severe strain or shock, it is admirably suited, as has been demonstrated by its use in making propeller wheels, cast solid hub and arms. One of these, weighing about three and a half tons, was

Fig. 3.—75 Diams. Rolled, Etched Light. National Disk Sharpener.

found to be slightly warped when cool, due to the fact that enough information had not, at that time, been gained re-

garding the shrinkage of the castings. The extreme ductility of the casting was shown by squeezing the blades to the proper angle and pitch without in any way injuring the metal. The metal's non-corrodibility makes it suitable to marine work and there is no doubt a large future ahead of it in this branch of engineering.

When drawn into wire or rolled into bars it is adaptable to valve-stems, shafts, piston rods, resistance wire, rustless screens screws, rivets, etc. When made into bolts it is better than steel for the reason that on a bolt of Monel metal the threads are very much less liable to strip. Monel bolts, half-inch diameter, are 30 to 35 per cent. stronger than steel bolts of the same size.

The accompanying table shows the comparative results of tests on Monel metal, steel and copper.

Figures in pounds per square inch.	Monel Castings. Grade C	Monel Castings. Grade D	Carbon Steel Castings. Hard	Carbon Steel Castings. Medium	Carbon Steel Castings. Soft	Monel Metal Rolled	Monel Metal Rolled; Annealed and Cold Drawn	Carbon Steel Forgings. Annealed	Carbon Steel Forgings. Oil Tempered	Nickel Steel Forgings Annealed	Nickel Steel Forgings Oil Tempered	Monel Rolled Plate	Soft Steel Plate	Copper Plate
Tensile strength.....	70,000	85,000	85,000	70,000	60,000	100,000	110,000	80,000	90,000	80,000	95,000	90,000	60,000	34,000
Elastic limit.....	27,000	40,000	38,250	31,000	27,000	50,000	80,000	40,000	55,000	50,000	65,000	45,000	30,000	18,000
Elongation in 2 inches..	30%	25%	15	18	22	30	25	22	20	25	21	30	35	52
Reduction of area.....	35%	25	20	25	30%	50	50	35	45	45	50	60	35	57

These results show Monel metal to possess a greater tensile strength (about 25 per cent.) than high-grade rolled steel, with a greater elastic limit (about 50 per cent.) and ductility. Besides these qualities, must be remembered the quality of withstanding corrosion, a very important property. Tests on wires drawn down from the rolled metal show them to be soft and pliable as well as very strong. In a compression test on a piece of the rolled metal one-half inch diameter and 1.895 inches long, the surface began to scale slightly at 77,500 pounds and buckled at 95,000. The test piece exhibited showed clearly the ductility, the piece being compressed to one-half its original length without giving signs of any cracks.

The accompanying illustrations are exact size reproductions of micro-photographs of the cross section of pieces of cast and rolled Monel metal. Fig. 1 and 2 are of the same cross-section, but in Fig. 1 the light is directly on the section while in Fig. 2 the illumination is at an angle. The light and dark patches show the size of the crystalline grains. Figs. 1 and 2 are magnified 15 diameters. Fig. 3 is a micro-photograph of the cross section of a rolled specimen magnified 75 diameters and etched lightly.

In working the metal in a lathe or similar machine it gives as satisfactory results as does mild steel without chattering. As the metal draws perfectly into a smooth tube it is very well adapted to use in condensers and flash boilers such as are used on automobiles and in motor boats. Experiments and tests are now underway to determine the physical constants of the metal, its electrical qualities and the effect produced by varying amounts of iron, silicon, carbon copper, etc.

MACLEAN CO.'S NEW MONTREAL OFFICES.

The Montreal offices of The MacLean Publishing Company, which for several years have been located at 232 McGill Street have during the past month been removed to the handsome office structure erected by the Eastern Townships Bank. The new building is one of the finest in Montreal, standing ten storeys high. It occupies a commanding position at the corner of Victoria Square and St. James Street.

The new offices of The MacLean Publishing Company have been specially fitted up for their convenience with every degree of comfort and facility for the transaction of business. The ceilings are high while there is an abundance of floor space for the members of the large staff, the business and editorial rooms being separate yet within easy reach of each other. There is a special elevator accommodation, three high speed traction elevators being installed. This is the only installation of its kind in Montreal, a feature of which is the rapidity and ease with which they can be operated. The cars can be reversed at top speed without any noticeable discomfort to the passengers.

Each floor of the magnificent new building has its own vaults. There are mail chutes, electric light, telephones, electric bells and other modern features on every floor, which make the new premises of The MacLean Publishing Company, which are within a few yards of the late offices, ideal and central from every standpoint.

SEMI-ANNUAL MEETING OF A.S.M.E.

The American Society of Mechanical Engineers will hold its spring meeting at the Willard Hotel, Washington, D.C., May 4-7. Sessions will be held at which papers on the conveying of materials, gas power engineering, steam turbines, the specific volume of saturated steam, oil well pumping and various other subjects will be read and discussed.

During the convention President Taft will hold a reception for the members at the White House. The War Department will give a special exhibition drill of the U.S. troops at Fort Myer, to which the members and guests will be invited. Excursions will also be made to the museums, city pumping station, city electric plant, etc.

The papers to be presented are as follows: A Unique Belt Conveyor, Ellis C. Soper; Automatic Feeders for Handling Material in Bulk, C. Kemble Baldwin; A New Transmission Dynamometer, Prof. Wm. H. Kenerson; Polishing Metals for Examination with the Microscope, A. Kingsbury; Home making in the arid regions; Marine Producer Gas Power, C. L. Straub; An Operating System for a Small Producer Gas Power Plant, C. W. Obert; A Method of Improving the Efficiency of Gas Engines, T. E. Butterfield; Offsetting Cylinders in Single-Acting Engines, Prof. T. M. Phetteplace; Small Steam Turbines, Geo. A. Orrok; Oil Well Tests, Edmund M. Ivens; Safety Valve Discussion; Specific Volume of Saturated Steam, Prof. C. H. Peabody; Some Properties of Steam, Prof. R. C. H. Heck, and A New Departure in Flexible Staybolts, H. V. Willie.

If the conditions are favorable there will be an ascension of a dirigible balloon and an aeroplane during the convention. In that event the Secretary of War, Mr. J. M. Dickinson, proposes to invite the members and guests

J. A. Kilpatrick, St. Thomas, who is now manager of the Canada Iron Corporation has, with others, acquired the large car wheel works of the Geo. H Thatcher & Co., Albany, N. Y., and is president of the new company.

The Interesting Manufacture of Seamless Steel Tubing*

Description of Processes for Drawing of Seamless Tubes from Solid Steel Billets and from Plates, Illustrating Shelby Steel Tube Manufacture.

Of all the important special branches of the steel industry, the manufacture of seamless steel tubes is perhaps the youngest; and of all young industries, it is probably the one with the most promising future. While the Bessemer process of making steel is about half a century old, the present modes of making seamless steel tubes in the United States date back less than half a generation.

Looking into the early days of the tube industry, the most simple and obvious methods of manufacture were naturally followed first, and "lap-welded" tube was the result—a flat strip of metal of suitable thickness being bent into tube shape until its longitudinal edges lapped, these being afterward soldered or welded together. Welding was first done under a trip-hammer, or sometimes by hand.

In 1825 machinery was invented for butt-welding by means of a chain-bench placed in front of a furnace, the heated tube being carried through a die or bell by means of an advancing chain and tongs, driven by suitable power. This process, with steady modifications and improvements, is esentially the one in use to-day for all butt-welded steel pipe.

Seamless Processes.

The possibility of producing a homogeneous and ductile steel in large quantities is a comparatively recent achievement, and to it is due the remarkable development and success of the seamless steel tube industry in America and abroad. The early efforts of experimenters who aimed at seamless tubes in steel show the influences of the old methods followed for the ductile metals, brass and copper.

In breaking away from the old methods of making brass and copper tubes, the expected steps of departure are seen. What seems to be the first attempt to make seamless tubes appears in 1837, under the English patent of Hanson. This provides a thick, short cylinder of cast-steel, which is raised to a very high temperature and placed into a matrix, and then by means of a hydraulic ram the metal is squeezed through a small orifice around a punch, a seamless tube being the result.

Sometimes solid bars of steel were drilled from end to end to make a tube-

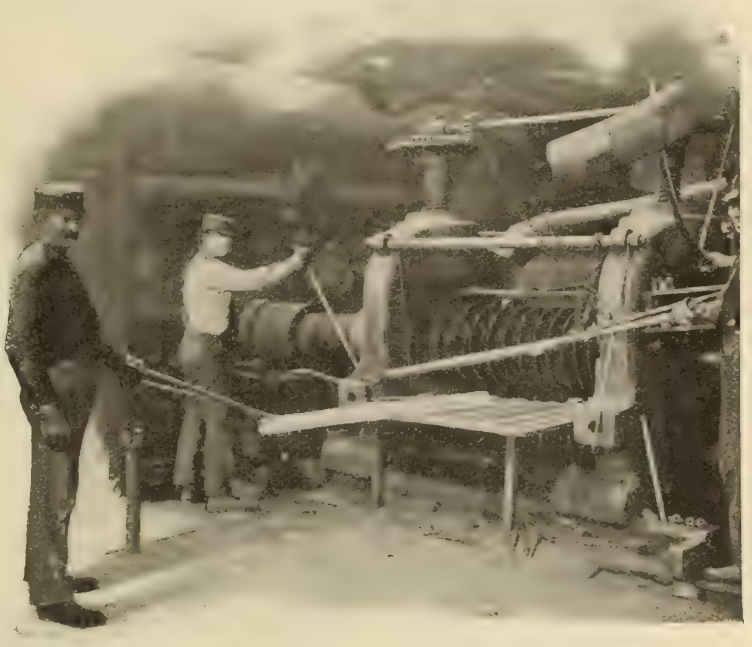

Fig. 3.—Rolling Tubes, hot. After Piercing Operation.

* For the illustrations in this article we are indebted to John Millen & Son, Montreal, Canadian agents for Shelby Steel Tubing.

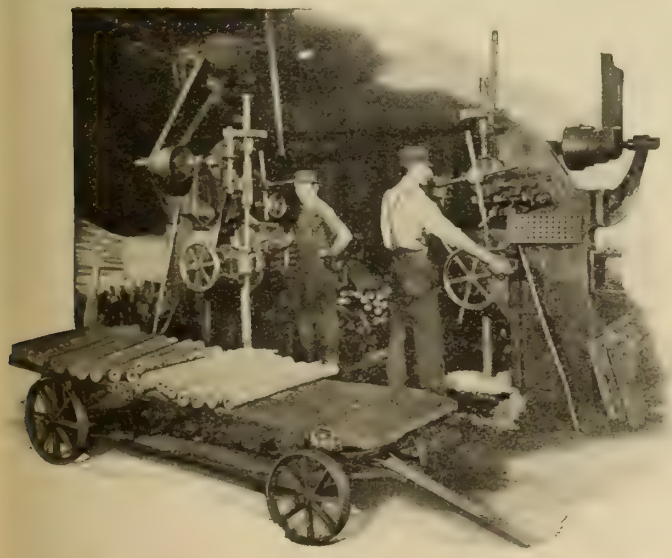

Fig. 1.—Centering Billets before Heating for Piercing Mill.

Fig. 2.—Heated Billet Entering Piercing Mill.

shape suitable for the cold-drawing operation, but this process was slow and expensive. One of the first attempted processes, while not successful for small tubes, has since been satisfactorily developed for tubes larger than 5 inches outside diameter; this is the cupping method, which consists in pressing a cup or cap from a flat plate and progressively elongating it into a tube by decreasing the diameter while it passes through a series of reducing dies. This method is practiced in the manufacture of tubes from 5 to 30 inches in diameter.

Fig. 5.—Tube After being Mashed Together from Ends.

While the "piercing" process was being perfected, steel-makers were engaged in producing a uniform quality of mild steel which would permit satisfactory piercing and cold-drawing and yield also a finished tube with all the required physical attributes. Both quests—for a machine to work and a steel to be worked—were practically satisfied at the same time, and seamless steel tubes then began to count as a respectable branch of the great steel industry in America. The application of Shelby seamless tubes to marine and naval boilers gave a substantial impetus to the business and directed it along new lines; and when the leading railroads began to specify Shelby tubes for their locomotives, their success and future were finally assured. It cannot be said that either the steel or the methods of making tubes from it are perfect to-day; but it is certain that the initial difficulties have been successfully overcome.

Manufacture of Seamless Steel Tubing From Billets.

Much of the success of Shelby seamless tubing is due to the excellent qualities of the steel used. This steel is shipped to the rolling mills in blooms 7 inches square in section, and about 6 feet long, weighing approximately 750 pounds each. The blooms are sent to the heating furnace, and after acquiring a suitable temperature are rolled from their square section to round bars, which vary in diameter according to the size of tubes required to be made from them. Some of the bars are 6 inches in diameter when finished; others are as small as 2½ inches. For convenience in shipping they are cut to lengths of about 10 feet, and sent to the various tube mills on factory requisitions.

The piercing machines at each mill have different capacities, in sizes and quantities; the "rounds" must therefore be cut again into pieces which will furnish with the least waste the size, length, and thickness of tube required by the factory's orders. After being cut to the working length the steel is known as a billet. It may be from 1 to 5 feet long; but it must contain as many cubic inches of steel as the finished tube, plus enough to cover the losses incidental to manufacture.

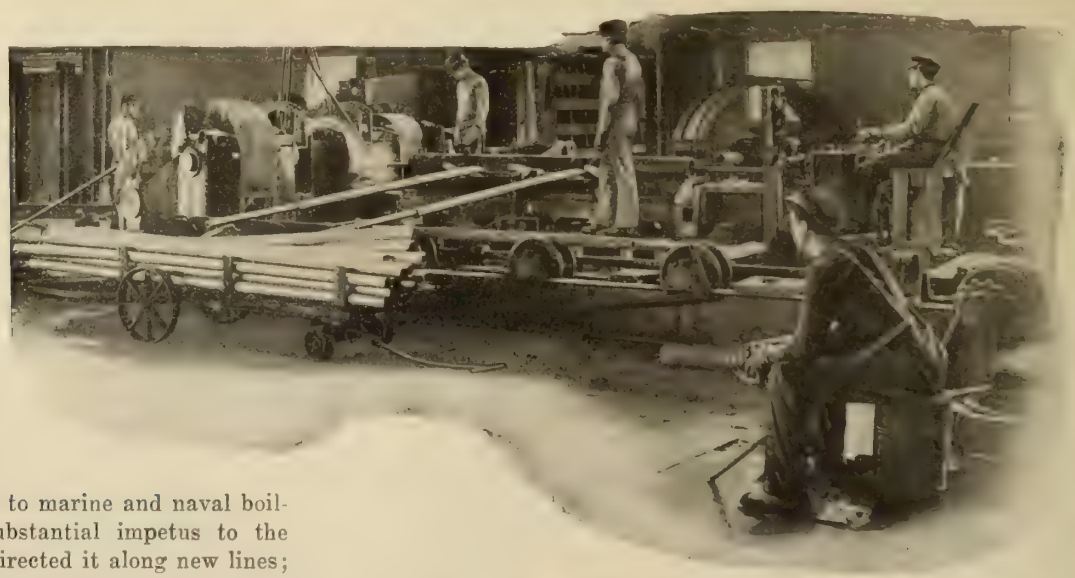

Fig. 4.—Pierced Billet Coming out from Disks Over Mandrel Rod

It is important that the piercing point should strike the very centre of the solid billet as it advances, for if it does not the steel will be thicker on one side of the finished tube than on the other, and no amount of careful cold-drawing can correct the eccentricity. To insure the passage of the point through the centre of the billet, each one is drilled suitably before it passes to the heating furnace. The bottom of the furnace is inclined, and the centred billets of the proper length are fed into the upper and cooler end, from which they roll by gravity to the lower end, where the temperature is high enough to render the steel soft and semi-plastic. Close to the discharging end of the furnace the piercing mill is located, and the billets are fed into it, centred end foremost, either automatically or in the smaller mills, by hand.

The solid billet, almost white hot, is pushed forward until it is caught by the revolving piercing disks, and from that point onward the machine completes the operation without the touch of a human finger. When the billet reaches the stationary piercing point of malleable iron, and starts to pass over it, forced by the forwarding and revolving action of the heavy rotating disks, only a slight, dull, grinding sound is audible; there is nothing spectacular about the operation, nor much suggestion of the enormous power required to displace the metal from the centre of the hot billet towards the outside. So powerful are the piercing disks and so carefully planned is each part of the massive machinery that the billet is easily molded into a tube.

The tube is passed a second time to a

heating furnace, and at the proper temperature it is rolled over long round bars of tool steel, through grooves successively smaller, and in this manner converted into a long, thin-walled tube with a fairly smooth surface finish.

Even now it is only a hot-rolled tube, and lacks accuracy in diameter, gauge, and roundity. One more operation known as "pointing" is needed to make it ready for the bench-room. Pointing consists in hammering the heated end of each tube into a solid point, which can be caught by the heavy tongs of the drawbench in which the tube is to be cold-drawn.

Before tubes can be cold-drawn they must be clean and free from scale. They are therefore pickled in an acid bath which is heated and kept in constant agitation by jets of steam.

Cold-Drawing.

The operation of cold-drawing is extremely simple in principle, and not in any manner new. It is practically the same for steel tubes as it is for brass and copper. All that is necessary is strong machinery and enough power to move it. The benches are substantially built of steel, and each is furnished with a heavy, square-linked chain, which runs over a wheel placed just underneath the die. This chain extends along the bed of the bench, for from 15 to 40 feet, to a sprocket which is geared to the main shaft from the engine, and it returns underneath the draw-bench. Dies are made from the very best grade of crucible steel, and are machined to the thousandth of an inch, to govern the outside diameter of the tube which is to be drawn. All tubes except those smaller than ½-in.. inside are drawn over a mandrel. This mandrel is kept in position by a long bar which goes inside of the tube and holds the mandrel just even with the die while the tube is being pulled.

The drawing operation hardens the metal and makes it necessary to anneal every tube before it can be drawn again. It may require from two to twenty passes through dies of varying diameter to produce a tube with the required dimensions. Such a tube must be annealed after each pass to eliminate all the brittleness of the steel which resulted from previous cold-drawn passes and to permit further drawing.

The process of annealing is attended with the formation of scale; and, this necessitates a return of each tube to the pickle-bath each time it is annealed. The intermediate anneals, or anneals between bench-passes, are made in open furnaces; but for the consumer tubes are annealed to the buyer's specifications.

The "points" of the tubes remain until after the last pass through the dies, which brings the tube to the desired outside diameter and thickness; then, after the requisite anneal has been given, the tube passes to the cutting-off machines, where it is either cut to specified lengths or multiples, or cut to the best advantage in random lengths. Boiler tubes are tested by hydrostatic pressure. but mechanical tubes are not so treated.

From the cutting department, the last step in the process is to the shipping-room or to the stock-racks, of which partial views are shown.

Fig. 6.—Group of Cups Used to Make Seamless Tubes of Large Dimensions.

Seamless Tubes From Plates.

The processes so far described are those followed in the manufacture of seamless tubes and tubing from solid steel billets. These processes are employed for all sizes up to and including tubes 5½ inches outside diameter; but for tubes larger than this the methods are different. It will be readily comprehended that to obtain a seamless tube, say 20 inches in diameter, from a solid cylinder of steel would necessitate piercing machinery of most gigantic and unwieldy proportions, and to drive such machinery would require tremendous power.

In small tubes, the ratio of length to diameter is large. Taking a tube measuring one-half inch outside, it is possible to produce it in lengths as great as 40 feet, and the ratio of length to diameter in this case is 960. There are many uses for tubes of this size and length. But a tube 20 inches in diameter is rarely called for in lengths greater than from 6 to 10 feet, and in this case the ratio of length to diameter is not more than 6. Therefore very large, heavy-walled tubes are made from plates of steel, rolled in squares.

The corners are first sheared off to produce a circular disk, which is heated to redness, withdrawn and placed on the anvil of an immense hydraulic press, by which the plate is punched into a rough, shallow cup. The cup is again heated and punched through a smaller die to elongate or deepen it, and at the same time to reduce its diameter. Perhaps it goes a third or a fourth time through a similar operation before it is ready for the finishing passes on the hot-draw bench. This apparatus, as shown by the engraving, consists of a heavy cast-steel frame or body, provided with a powerful hydraulic cylinder and a plunger which operates through the full length of the bench. Plungers of various sizes are used according to the size required in the finished tube, and dies of successively decreasing diameter are dropped in recesses in the bench-frame in positions so that the heated elongated steel cup may be forced through them one after another, the final and smallest one pressing the steel down tight towards the plunger for the full length of the tube. The plate has now passed almost completely into tubular form, and the original head, or the bottom of the "cup," forms but a small proportion of it. Subsequent hot-drawing operations may be necessary to produce a tube with a smaller diameter, a thinner wall, or a greater length. Finally the head, or closed end of the tube, which remains until the last operation is completed, is cut off, and the process is finished.

Fig. 7.—Hot Driving Bench Tube in Process

HOW TO GET THE ACCURATE COST.

By a Cost Clerk.

The cost of a manufactured article consists of three parts or items: burden expense, raw material, and time or labor. This burden expense is arrived at by adding up all of the items of fixed charges, office expense, selling expense, material consumed in manufacturing, such as oil, waste, etc., which cannot be charged direct to any specific article non-productive labor (which should be obtained by dividing the pay roll into two parts of productive and non-productive.) The total of this non-productive pay roll should go into the burden.

Not until work is begun on the raw material is there anything produced by or from which you can get back the money paid out for burden expense, therefore we must add the burden expense to productive labor. How can we add it and have it properly distributed? You will say perhaps a certain per cent. to the cost of material and labor. We have shown you above that raw material had nothing to do with expense, therefore you should not add a certain per cent. to the cost of that material as a burden. It was the productive labor that consumed that burden. Then you say you will add a larger per cent. to the cost of labor. But this will not do. For example, you have two men working side by side at the bench; one you pay 45c per hour, the other man 20c per hour. Each man works on his respective piece of work eighteen hours. By the percentage method you charge, say, 40 per cent. of labor cost on each man's work to cover burden expense. On this basis, for the first man's share you charge $3.24 and only $1.44 for the second man, and you cannot show where the first man consumed more of the actual burden expense than the other, and yet you are charging over twice as much to the first man's labor.

To get the proper amount to add to this labor to cover this expense, you should divide the total amount of the burden expense for the month by the total number of productive hours. Say your burden expense is $720, and your productive hours are 3,600. This gives you a rate of 20c a productive hour, therefore to the first man's wages of $8.10 you add the burden rate of 20c per productive hour, eighteen hours $3.60, making labor $8.10, burden cost $3.60, material $4.50, total $16.20, the absolutely accurate cost. To the second man's wages of $3.60 you add the burden hour rate of 20c per productive hour, eighteen hours $3.60, making labor $3.60, burden cost $3.60, material $1.50, accurate cost $8.70, and to this you add what per cent. of profit you intend to make.

By the percentage basis, add 40 per cent. or $3.24, to the first man's wages of $8.10, material $4.50, making cost $15.84, a difference of 36c short of actual cost. To the second man's wages of $3.60, add 40 per cent., or $1.44, plus cost of material $1.50 making a total of $6.54, a difference of $2.24 short of actual cost. This is where you fall short of making the profit you had figured on. If you will give this careful thought you will see it is the only way to arrive at the accurate cost.

It is comparatively easy to obtain the cost of material that enters into your product, but the time or labor is the slippery element of cost, also the proper burden rate has been difficult to ascertain. By the use of special cost keepers on the market you can get the elapsed time of every operation, every job, exact labor cost to a cent on every order that goes through your works, also the productive hours, which will give you the proper burden rate and absolutely accurate distribution of your burden expense, saving you thousands of dollars a year.

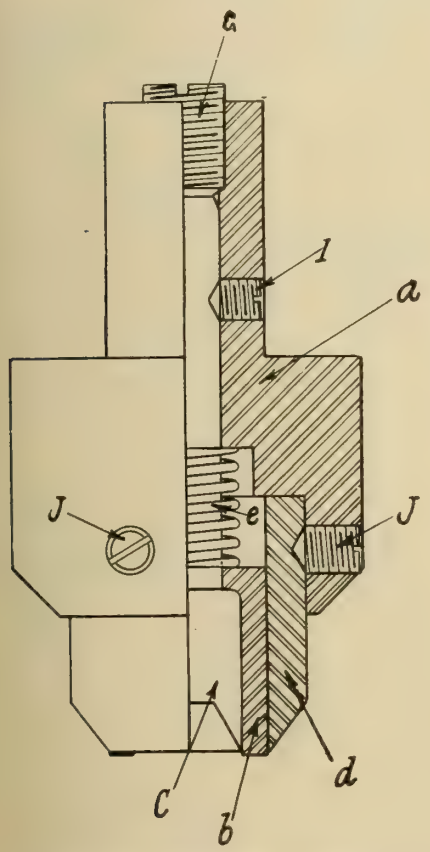
TOOL FOR CUTTING FIBRE WASHERS.

By J. MacFarlane.

The enclosed sketch shows a handy tool for blanking out fibre washers.

A is the punch holder (with stem turned to fit press) bored to receive the centre cutting punch c, and counterbored to receive the outside cutting punch d.

B is the blank holder or pushout kept in position by coil spring e. The screw G takes the end thrust of the centre punch c, which is secured in position by the screw I.



Tool for Cutting Fibre Washers.

The screws J J are to keep the outside cutting punch in position. The stock to be cut is passed between this tool and a plain block of brass, the tool just making an impression on the surface of the brass block.

FINISHING LOCOMOTIVE PISTON CENTRES.

The machine illustrated here is a Gisholt 34-in. lathe, and the operation that of finishing locomotive piston centres. The piece A is first held in the hard chuck jaws B and in addition three chuck, or face plate, blocks C are used between the jaws to give an increased grip on the piece. First, the scale is removed from the concave surface and face of piece with tool post tool N, and the hole rough-bored at the same time by cutters D and E in boring bar F, this bar being supported in the chuck by bushing T. Cutters E_1 and D_1 in bar F_1 are used for bringing the hole approximately to size and it is finished with the taper reamer M. The hole completed and the scale removed, the bushing L is inserted in the hole in piece and used for supporting the arbors K and K_1, in the facing heads as shown on faces 6 and 3 of the main turret. The four cutters G, H, I and J in the facing head on turret face 6, bring the surfaces indicated to the approximate size, after which they are finished by the cutters in the facing head on face 3 of the main turret. The tool post tool O is then swung into position and used for slightly rounding the corners of the rim, completing this operation.

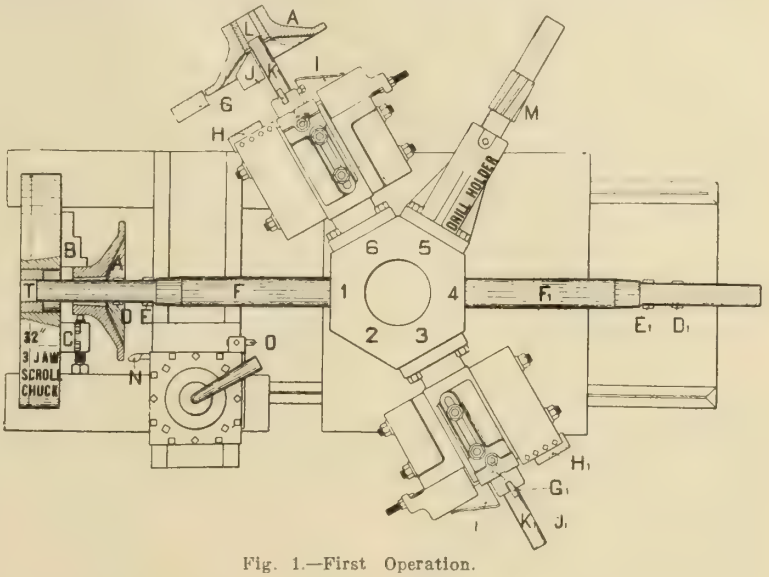


Fig. 1.—First Operation.

Second Operation.

The piece A in this operation is held in three soft slip jaws B, bored out to fit the periphery of the piece, finished during the first operation. Before the piece is chucked, the taper bushing L is inserted in the hole for supporting the arbors in the facing heads. First, the scale is removed on all the outside surfaces by tool post tool N. The facing head on face 6 of main turret is then swung into position and, supported by arbor K, inserted in the bushing L, brings the piece approximately to size on the surfaces indicated by the cutters D, E. and F. Next the finishing head on face 3 of main turret is swung into place and the cutters D_1, E_1 and F_1 bring the surfaces indicated to the proper size, completing the operation.

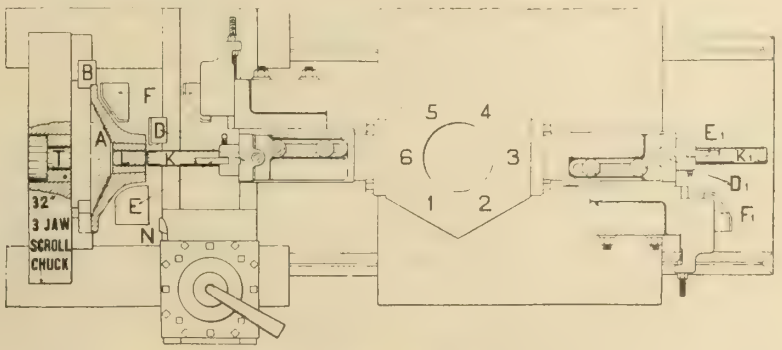

Fig. 2.—Second Operation.

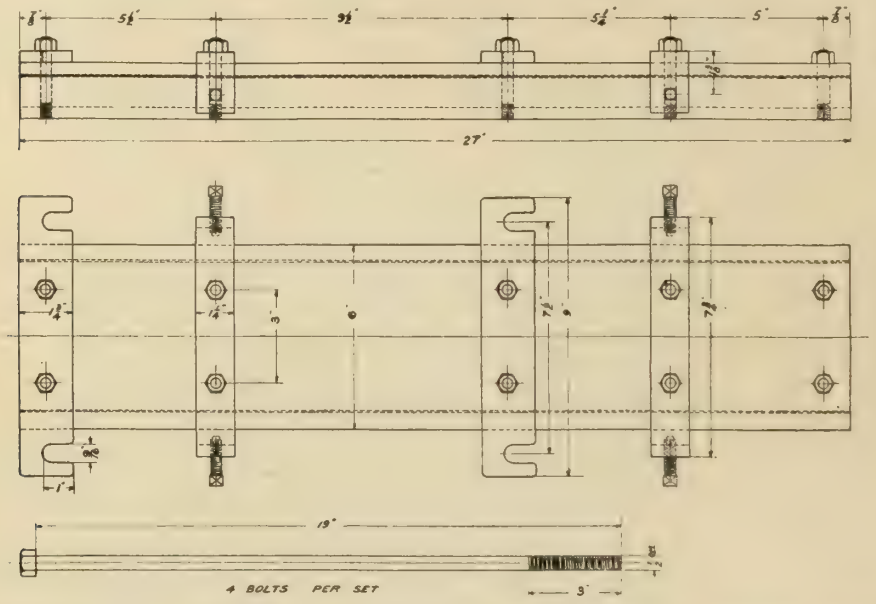
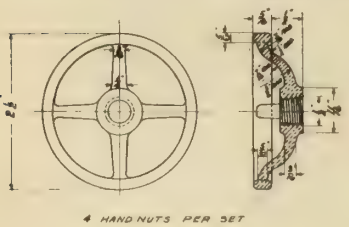
JIG FOR RETINNING CROSSHEADS.

Various jigs have been used for retinning crossheads. The first were rather crude, consisting of a steel channel which fitted into the crosshead where the retinning is to be done. A small piece is turned at the top of the angle the thickness the metal is to be. The channel is kept in the centre of the part by sand. This is the crudest form and is not used in special railroad shops.

The next development is a side plate similar to the one shown, but without the bolts. Only one jig was used at a time. This style of jig has been used in some railroad repair shops.

The jig shown in the illustration is one used in the G.T.R. Stratford shops, and is an interesting device. Two jigs





Jig Used at G.T.R., Stratford, for Retinning Crossheads.

are used, one on each side of the crosshead as shown. By means of these four tie bolts the jigs are used to a standard width. The four ⅝-in. x 1¼-in. long set screws shown on the side of the clamps, are used to have an even quantity of metal. The lower right-hand sketch shows the jigs applied to the crosshead. All the detail parts are shown in the other sketches.

STARRETT'S NEW TOOLS.

The attachment, Figs. 1 and 2, is made to fit the 12, 18 and 24-inch blades of Nos. 11, 23 and 33 Starrett squares, and can be used in connection with any of the regular rules as wide as an inch, or with flat steel square No. 21 for laying out key seats, etc.

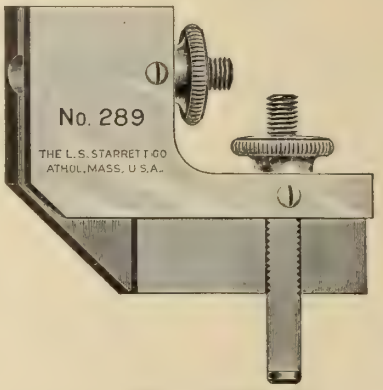


Fig. 1.—Attachment

Fig. 3 is a V block with a slot above the V, containing a flat spring to frictionally hold the centre gage parallel with the block. Placing the V block against a lathe spindle or face plate, a threading tool can be adjusted to line perfectly to cut both sides of a thread to the proper angle, eliminating uncertainty, for both external and internal work.

This gage, Fig. 4, is made of steel, drop forged, and designed with a view to getting different heights on a planer. The gage will measure from one-half to 5½ inches. It will also be found very convenient on other tools, such as milling machines where slots are being milled, etc. The gage can be inserted in the slot and by sliding the block on the

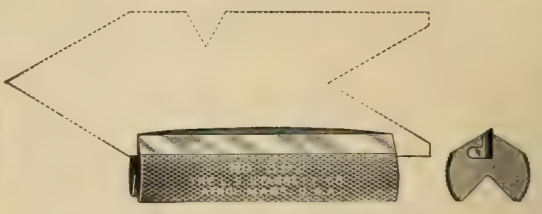

Fig. 3.—Center Gage Attachment.

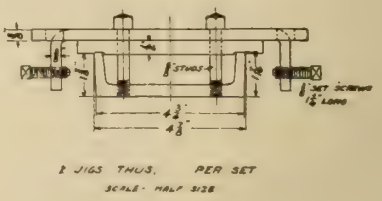
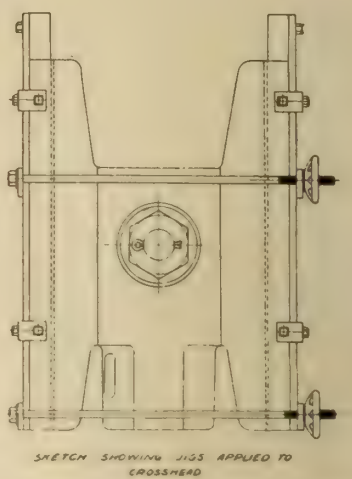
wedge a perfect fit is given. Then the tool may be taken out and exact measurement obtained by use of a micrometer. When a certain close measurement is desired the tool can be set by the micrometer and used as a standard gage.





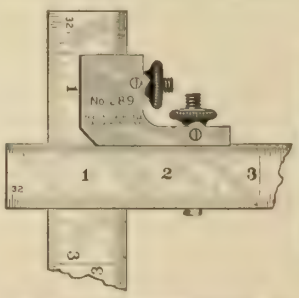


Fig. 2.—Attachment in Use.

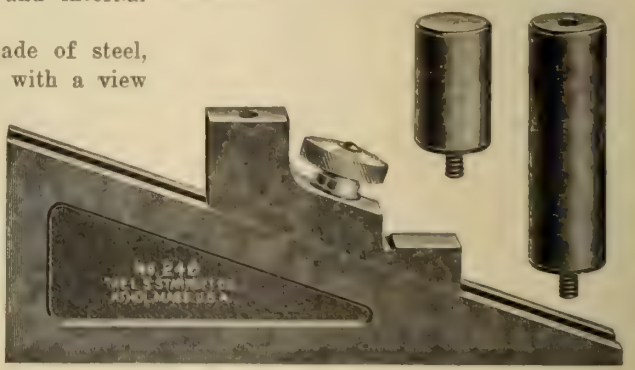

Fig. 4.—Planer and Shaper Gage.

These tools are made by L. S. Starrett Co., Athol, Mass.

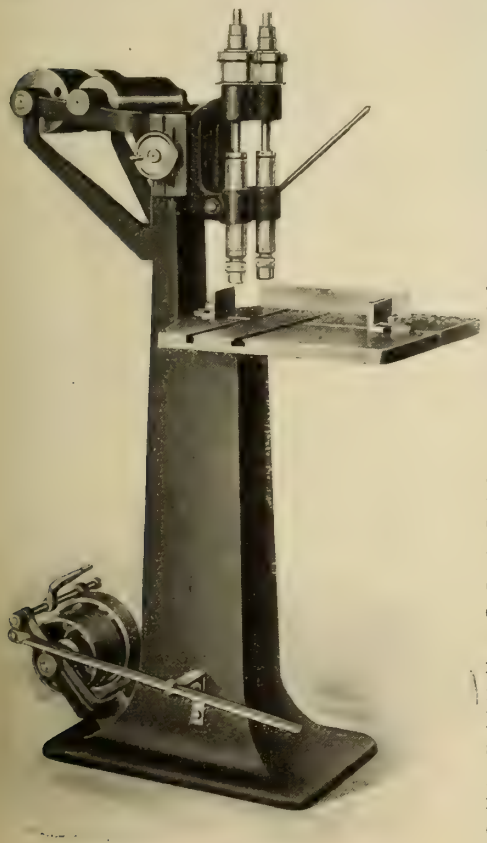
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

BAWDEN SENSITIVE DRILL.

The distinctive feature of this multiple spindle, sensitive, high speed drill is the method of relieving the spindles of the pull of the driving belt. The way this is accomplished is by having the pull come directly on the bearings. The upper bearings are right below the driving pulleys. The effectiveness of this construction is increased by the use of ball bearings.

The result of this construction is the retaining of the greatest sensitiveness and accuracy at any speed up to 4,000 r.p.m., the qualifications aimed at in the design of the machine.



Bawden Sensitive Drill.

The spindles are adjustable to centres by means of a hand wheel. One spindle can be moved to a width of 8'' and drills can be made wider if desired.

The machine is manufactured by the Bawden Machine & Tool Co., 22 Orillia Street, Toronto.

UNDERWOOD BORING, TURNING AND FACING MACHINE.

This tool shown in the accompanying half-tone is designed principally for facing off the rivet heads on crank pins when it is necessary to remove the latter, but is also adapted to a wide range of other work.

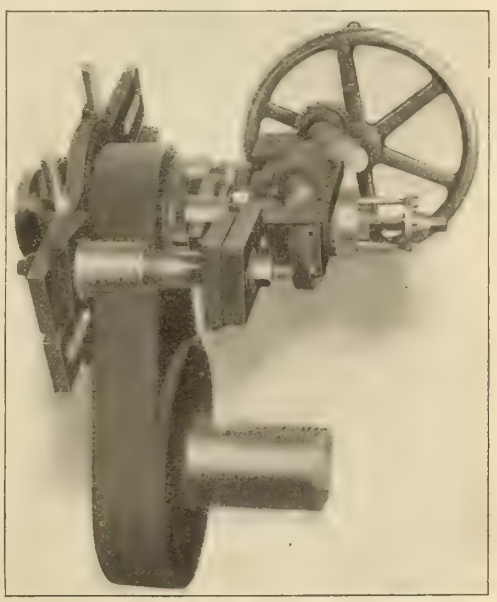
This machine is easily set up and will cut out the metal in a neat manner. It is readily clamped to almost any piece of work and is then in position to bore, turn or face. It consists of a slotted crosshead which forms the base of the machine and a casing which contains a worm wheel having large integral hubs for resisting wear. Through the worm wheel the cutting spindle slides with a range of four inches. This feed is adjusted by hand. In the end of the spindle is a steel slide for the cutting tool and this is adjustable for different diameters by means of a feed screw, the maximum diameter being about 12 inches. Two slotted crossheads, which in the centre are cut V shape, clamp the work (the V's will take practically all sizes) and are pulled together by one inch through bolts. There are two adjustable spacing blocks threaded to receive each other and bored out which will straddle different diameter cranks, locomotive wheels or other work. Bolts pass through these blocks and clamp the machine proper to the crossheads.

The entire arrangement is very firm and solid and each piece being light in weight is easily handled by one man. The machine is quickly centred and has three changes of speed for heavy, medium or light work. These speeds are obtained by interchanging the gears shown on the driving shaft or by driving direct without them. The spindle is at right angles to the base or crosshead and by means of an extra facing attachment can be used for facing off pump or engine valve seats, it being immaterial whether or not the steam chest is solid or the valve seat several inches below the face of the chest. The machine may be driven by hand or any other suitable power.

This machine is manufactured by H. B. Underwood & Co., Philadelphia, Pa.

BLISS AUTOMATIC DOUBLE SLIDE PRESS.

The press illustrated on page 50 was designed to produce rapidly and accurately from ribbon stock, small sheet steel and sheet brass articles, the manufacture of which requires series of operations. The machine produces 180 finished blanks per minute, requiring a total of 1,460 operations per minute. The press performs eight operations at each stroke of the slide (after the first seven strokes) a finished blank being produced at each stroke. The elimination of all intermediate handlings, the saving in labor and shop room, and the entire absence of any danger to the hands of the operator are special features of this press. The top and bottob slides are operated by toggles driven by one shaft; the operation of this shaft being controlled by a friction clutch, by which means the press at any point of the stroke is always under the instant control of the operator. Another additional advantage of this type clutch is the fact that the press can be stopped or started while the feed is on its point of dwell, which is not the case where the conventional positive press clutch is used, due to the fact that presses so equipped stop on the top centre while the feed is at its highest speed and must necessarily stop and start with a certain amount of shock which has a tendency to strain the feed mechanism In cases where ribbon stock is being fed this also causes some slip of the ribbon with a consequent irregularity in the feeding.



Underwood Boring, Turning and Facing Machine.

The top and bottom toggle connections are each independently adjustable, enabling the changing of the timing of the operations. In this way the press may be adjusted so that either the top or bottom slide may finish its stroke first and then dwell until the

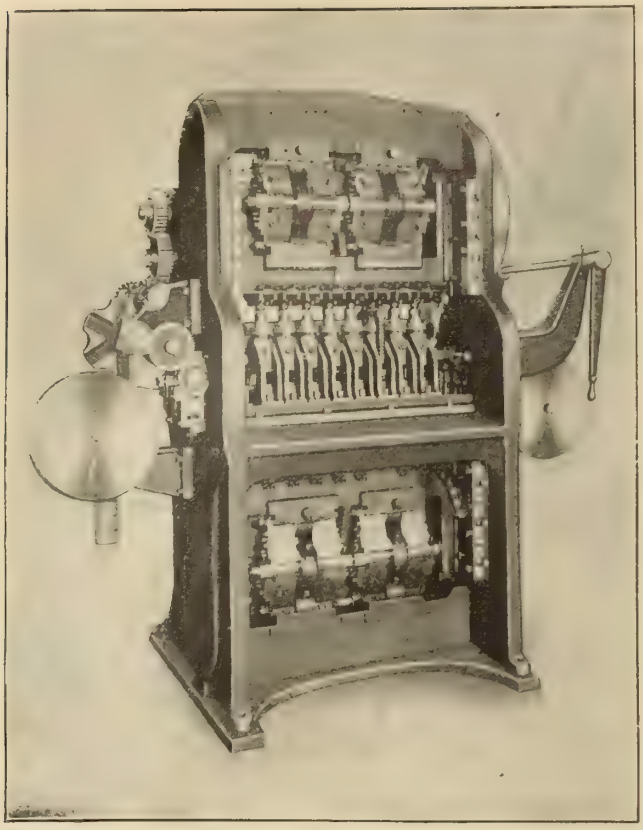


Fig. 1.—Front View Bliss Automatic Double Slide Press.

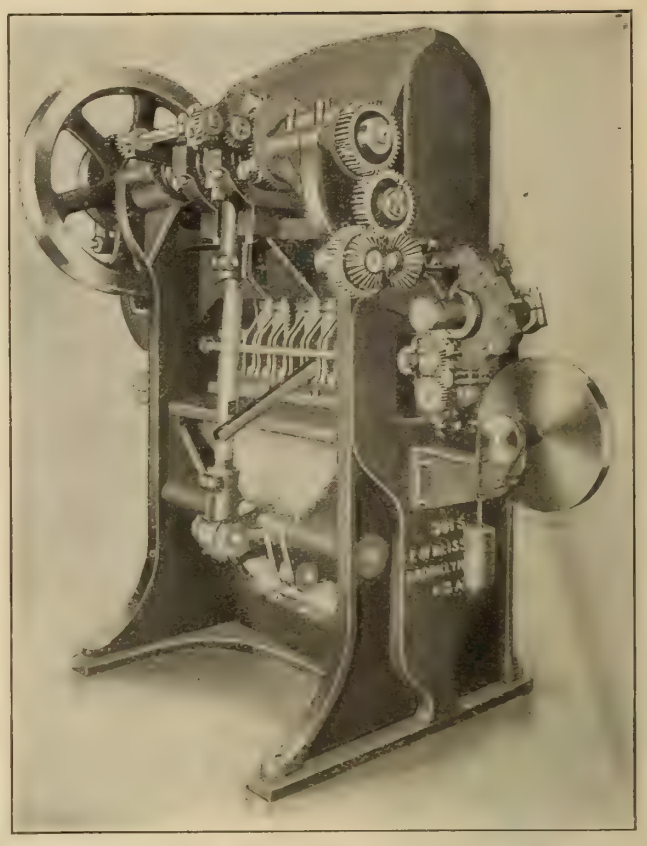

Fig. 2.—Rear View, Showing Feed and Stock Reel.

other side continuing performs the operation, the movement of the slides in relation to each other depending on the nature of the operation to be performed. The feed is actuated by a 6-point Geneva stop motion which feeds 120 degrees and provides an ideal motion for a feed of this class. There is provided for the stock a reel with a friction holdback, and for the scrap a reel with geared drive arranged with a compensating device, insuring uniform tension on the stock, regardless of the amount of scrap on the reel. The dies are each in a separate and independent sub-press and can readily be removed and replaced any number of times without the slightest danger of shearing the most delicate dies.

The stock used being in ribbons or strips of suitable width, is used as a feeding medium, and in this way a very high rate of speed is attained. The stock passing from left to right the entire width of the press, is controlled by a set of rolls on each side of the press.

In the case of work requiring drawing operations, the drawing is done previous to the blank being taken out of the ribbon, thus allowing the metal to contract in every direction. To provide for this contraction and the consequent change in centres, the dies are arranged in the independent sub-presses which permit of adjusting the distance between the centre dies, to match the distorted spacings due to the drawing operations.

This press was recently designed and built by the E. W. Bliss Co., 20 Adams St., Brooklyn, N.Y.

NEW MOLDING FLASK.

Louis W. Daman, of the Enterprise Foundry staff, Sackville, N.B., has been granted patents in Canada and the United States for an improved form of molding flask, which, it is claimed, will lessen the cost of manufacturing in foundries and will also help to increase the output. The new system made possible by the Daman flask will be applicable in all branches of foundry practice.

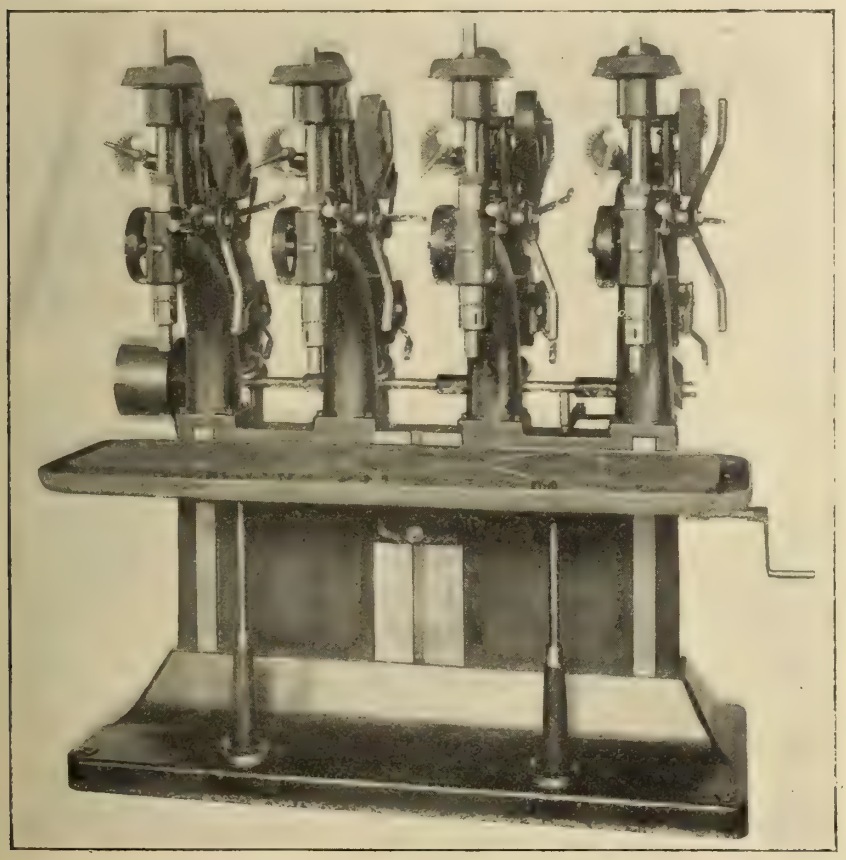
With the present foundry flask it is necessary to have a wooden or iron flask for each mold required excepting in bench molding, which is limited to a very small size. For instance, if a molder was capable of making 30 molds of a given size per day he would require 30 wooden or iron flasks. With this new system the number of molds possible is unlimited; all that is required is one flask and four or five jackets. The jackets are to be shifted from one mold to the other until all the molds have been filled. With the jacket in place and clamped down to the bottom board there is no chance for a run-out or strain on the castings, for there is nothing to yield to the pressure of metal while it is being poured. This is one of the many faults found with the present foundry flask.

Wooden flasks, which are mostly used, soon wear out, or twist and become weak. The loss from strain and run-out and burning of wooden flasks is great. On the other hand cast iron flasks are too heavy to handle quickly and the breakage is a great expense. Very often, too, a change in a pattern will make them useless. With the new system a great variety of castings can be made without any change in the system outside of a possible change in the bars. For instance, in the stove business, it is necessary to have 36 flasks to make one ordinary No. 8 cast iron range. If the business demands 20 ranges per day the foundry must have 720 flasks at about $3 each; with this new system it would require about fifteen flasks and 75 jackets only to make all the 20 or more complete stoves per day and a variety of other patterns.

To find the weight of castings, multiply the cubic inches by 0.27 for iron, 0.29 for steel and 0.30 for brass.

ALL GEARED 20-INCH GANG DRILL.

The Four Spindle Machine here shown embodies the same principles of construction that are characteristic of the All Geared 20-Inch Upright Drill. There are no cone or feed belts. Each spindle has four changes of geared speeds or eight changes when back geared. Each spindle has Positive Power Feeds, ranging from .001 inch to .025 inch, controlled by the small lever on the ratchet faced segment conveniently located as shown in cut. All changes of speeds and feeds are made instantly by the operator from front of the machine without stopping the spindle, and no stopping is necessary to throw back gears in or out.



Barnes All Geared 20-inch Gang Drill.

There being no cones while all four spindles are driven by a single shaft, yet any spindle may be instantly stopped by moving speed changing lever on center, thus throwing transmission gears out of mesh. The drift hole is placed below the sleeve so when spindle is stopped the tool may be drifted.

Single table with oil channel as shown is furnished with this box column type of gang, and table is supported by two screws, making a rigid and thrust, so that when clamped, the table does not spring under heavy work. Table is raised and lowered by means of crank at one end. When desired the Gang may be furnished with independent columns (having separate tables, either round or square) set on heavy bed base.

For tapping any or all spindles may be furnished with reversing friction clutches. Right hand spindle of the Four Spindle Machine shows same so equipped.

The spindle is double splined and fitted with No. 3 Morse taper or when so specified No. 4 taper will be furnished Each spindle will drill to center of a 20-inch circle.. Vertical travel of spindle, 10; vertical travel of table, 14; greatest distance from spindle to table, 27; floor space, Four Spindle Machine, 40 x 82; Speed of tight and loose pulleys, 400.

This machine is manufactured by the Barnes Drill Co., Rockford, Ill.

NATIONAL DIE SHARPENER.

This machine is intended for sharpening bolt cutter dies, giving them the proper entrance and correct clearance. It will sharpen any size or type of threading die.

A 6-inch wheel is used, which can be redressed to 3½ inches without affecting the machine's operation. A suitable chart is furnished for making the necessary settings for various diameters, and may be changed from one size to another.

This new die sharpening machine was recently brought out by the National Machinery Company, Tiffin, Ohio, manufacturers of bolt and nut machinery.

A FINE DESCRIPTION.

Under the above head the Daily Beacon of Stratford, makes the following reference in regard to the articles on the Stratford shops, which appeared in the April issue of Canadian Machinery.

"The April number of Canadian Machinery and Manufacturing News, published by the MacLean Publishing Company, Toronto, contains a number of articles on the new Grand Trunk locomotive shops in this city, which must be ranked as the best yet published. In addition to the features described by the local and other newspapers there are articles on the equipment of the machine department, with description of the machines, on the power house equipment, on the system of looking after tools, etc. and on the driving wheel quartering and crank-pin turning machine. These are, of course, written with technical knowledge which gives them special value to machinists. Interior views of the shops and of different machines in addition to those already published by other papers also embellish these articles, the production and publication of which is exceedingly creditable to the journal in which they appear."

National Die Sharpener.

Vol. V. MAY, 1909 No. 5

CANADA'S IRON AND STEEL PRODUCTION.

Although the pig iron and steel returns for Canada for 1908 show a decrease over the figures for the previous year, it cannot be said, considering the restricted buying of the railroad and other large concerns, that the falling off was very remarkable. Last year was not a good year for iron and steel in any country. In the States there was a considerable reduction of output, lower prices, and a general slow consumption. It is evident from the fact that Canadian pig iron production was only 25,000 tons less than the previous year's total, that we did not feel the general setback so acutely as our neighbors, and in addition producers held the prices more firmly.

It is interesting to note that the total output of finished steel for the second half of last year showed an increase of 43 tons over the first half, proving that buying improved towards the end of the year. Although many authorities claim that copper now reflects more accurately trading conditions, there is no doubt that the pig iron and steel returns are still the best barometer of the trading of the country.

According to unpublished returns gathered by Canadian Machinery from six large producing corporations in Canada, the total production of pig iron in Canada for 1908 was 556,044 tons which compares very favorably, considering conditions, with the amount returned for 1907, which was 581,146, a decrease of about 25,000 tons. Of this total for last year, basic comprised 155,734 tons, foundry 170,388 and bessemer 155,734. Comparing the figures for the first and second half of the year the totals were 281,329 tons, against 274,715, a decrease for the latter term of 6,614 tons.

The returns from eight companies making steel showed an output of ingots, etc., of 558,763, compared with 706,982 in 1907, a decrease of 118,219. The total output of finished steel, comprising rails, bar steel, railroad spikes, rods, plates, etc., was 538,842 tons. The first half of the year produced 247,803 tons, and the second half 291,039, an increase for the second term of 43,236 tons.

The total tonnage of rails amounted to 268,159 blooms to 153,541, finished rolled iron and steel 45,411 and castings, 9,676 tons.

FOUNDRYMEN'S CONVENTION.

The eyes of all foundrymen will be on Cincinnati, O., during the week of May 17-22, since at this time the leading associations of this industry will be in convention there. The American Foundrymen's Association and the American Brass Founders' Association meet from May 18 to 20; the American Foundry Foremen's Association on May 17 and 18; and the Foundry and Manufacturers' Supply Association, May 17 to 22.

These meetings will be occupied with the educational features of the foundry business exclusively. Interesting and instructive papers will be read at all the meetings, and the benefits to be derived by those attending will be invaluable. Not the least instructive part of the programme will be the exhibitions of the Foundry & Manufacturers' Supply Association. Practically all the leading manufacturers and dealers will show the latest devices for increasing efficiency and decreasing cost in the various foundry departments. As many Canadian Foundrymen as possible should attend. A close study of the apparatus shown will be a liberal education, and the knowledge thus gained will make the trip well worth the effort.

GET READY.

This isn't a sermon; we have no inclination to get into a pulpit and listen to ourselves talk but we do want to be of assistance to our readers. The inspiration for this chat came from a conversation we had with one of the big practical men in what are perhaps the largest shops in Eastern Canada. We asked him if there were many instances where a boy or man had been promoted and had "fallen down" on his new position, necessitating either a return to his old job or seeking new quarters. The answer we got was that it frequently happened, and the reason was given: "He wasn't ready." A man may be an expert in one grade of his work and may impress his employer with the fact that he is equal to increased responsibilities, with the accompanying increase in pay, but, unless he is prepared, unless he is ready for the promotion he will "fall down" nine times out of ten. The tenth man is one who is clever enough to get ready after he has his promotion, and there are very few of these.

A splendid way to get ready is to keep well posted with the developments in your trade, and to keep a tangible record of these developments because no one can keep them all in his head. A good way to do this is to subscribe to and read one or two good monthly technical papers. A more expensive way is to take a course either at a night school or through a correspondence school.

The excuse is sometimes given that one has no time for the technical papers. One half hour every other day will do wonders and there are few who cannot afford this much attention to their advancement. Above all things keep notes. This is one of the most helpful of all the plans to get ready. When you see a new way of doing a thing, make a note of it; when you read some interesting article relative to your line of work cut it out and paste it in your note book. An engineer-

ing notebook is a valuable asset and they cannot be compiled in a short time. It took years to gather together all the information in notebooks like Kent's or Trautwine's or Suplee's. If a question arises that is hard to find an answer to send it into your technical paper, they have mines of information available out of which to find the answer to your question. If you have done something some other way than somebody else has, write about it to your technical paper. They will remunerate you and, in publishing it, maybe help a reader out of the same difficulty. Writing your ideas makes you fluent, enables you to make yourself clear to others, is an assistance in getting ready, and the main thing is to get ready for that promotion when it comes along.

DEVELOPMENT OF HIGH-SPEED STEEL.

The rumblings of the "startling" disclosures made by Professor Arnold of Sheffield University, to an audience at the Royal Institute, have not as yet died away. The immediate result of his announcement was the extensive advertising that one firm got and that firm only. As a matter of fact the experiments with this steel were being carried on simultaneously by all the leading Sheffield steel firms, not by one exclusively. These makers were not publishing any announcement as to progress for a very good reason, namely that there were already on hand, huge stocks of tool steel worth approximately a million dollars which would be very sadly depreciated by the announcement of a metal superior in almost every way, as this new steel seems to be. As a result of the announcement a serious loss of business has been reported from Sheffield from the countermanding of existing orders for the old steel, and the holding back of contemplated orders pending more definite details of the new metal. It was not surprising therefore to hear a storm of protest from the makers and holders of these stocks of the "old" steel.

The new steel is not a revolution, but the natural outcome of continuous experiments tending to the improvement of existing tool steels. Makers know enough of the mysteries of high-speed steels to make special steels for special uses—that is if the purchaser will pay the extra cost. The ordinary high speed steels will not be driven from the market very easily, so long as makers continue to improve them without boosting the prices too high.

Now that the cat is out of the bag, so to speak, machinery users, makers and dealers will be interested in watching the effect that the new steel will have on existing machinery and the designs of machines to come. It is not such a great while ago that the machine tool design was reorganized to meet the requirements of the discovery of high speed steel and now we have another "discovery" which seems to call for a still greater advance in machine tool design. It's a wonderful age we are living in and of all the branches of industry, that of machinery is probably the greatest of them all. It has come to the point where we look through our papers (daily and technical) and are only surprised when we do not "discover a new discovery."

DON'T BLAME THE MACHINE.

Frequently a salesman, when going back to customers who have purchased machines or an engine from his house, will be confronted with the tale of woe that "the machine doesn't work right" etc. They consequently blame the machine first thing, without giving a thought to the consideration of hurtful outside agencies. These outside causes of dissatisfaction sometimes are very simple to remove and in one case which has been brought to our attention, the trouble was caused by graft, pure and simple. The oil that was being used was delivered under a false name as to quality, aad was absolutely of no use for the purpose for which it was intended. Although attention was called to this fact, the purchasing continued. Why? Because "somebody" was making a "good thing" out of it with little or no regard to the welfare of the machines upon which the oil was used nor the quality of work done by the machines.

Now, there can be no blame attached to the machines in these cases, no more than to the horse which does poor work on a diet of nothing but water. The fault lies solely at the door of those who purchase regardless of requisitions prepared by the men-in-charge, who know what they need.

Engineers and machinists should therefore be on the look out for this sort of "grafting" and expose it at once, because it is on them that it reflects. The engineer gets decreased efficiency in his plant and the machinist decreased output or an output of lesser quality. All concerned would be infinitely better off if this method of purchasing could be wholly eliminated and one of the most effective ways to start this elimination is to begin at the bottom and fearlessly expose the smallest attempt at purchasing "bad" under the guise of "good."

TOPICS OF THE MONTH.

Many improvements in machine tools and equipments have been noted during the past few months. Others are still under way. This has been one of the beneficial results of the recent trade depression.

* * *

The German-Canadian Economic Association will send delegates to Canada this summer for the purpose of promoting closer trade relations. Commissioners are also to be sent to Canada by German newspapers. Besides discussing with Canadian Ministers the advantages of greater commercial intercourse between the two countries, the delegates, who are to be representative German business men, will inform the Canadian public of plans systematically working up a German demand for Canadian products, the Economic Association aiming to be of mutual service to German and Canadian mercantile interests. If Germany would concede to Canada the same terms given to France, it would mean the opening up of a good German trade.

* * *

The campaign to eliminate the V thread from taps and dies is meeting with approval on all sides in United States and Canada. In our April issue the question was taken up and since then several comments have been received. The pioneers in the movement for abolishing the useless V thread were Butterfield & Co., Rock Island, Que. The old and inferior V thread soon gets dull and tears the piece it is tapping and destroys the whole tap. The thread of the V is too deep in proportion to the diameter of the tap, to withstand hard work. The U. S. standard gives 25 p.c. greater factor of safety and this difference is added to the shank and ensures working strain. The user can get tools from any manufacturer with a standard thread. The Whiteworth is a still better thread but chasers are expensive and hard to make. The thread is stronger and wears longer. A mechanic can easily make a U. S. chaser and therefore it is less expensive than the Whiteworth. Users will certainly find it to their advantage to adopt U. S. standard thread taps and dies.

Treating of the Economy of Individual Motor Drive and Illustrating Various Lines of Machines to which Motors have been Applied.

The use of the individual motor to drive machine tools is coming into greater prominence. The use of belt, chain, rope drives in group drives have

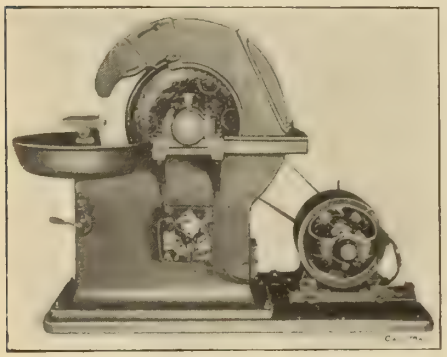

Fig. 1.—Motor Driven Emery Wheel.

their fields of usefulness and when a large number of machines are used at same speed, group drive is preferable. Single motors have an advantage of allowing machines to run at their maximum cutting speed. In this connection the direct drive of individual motors has a direct motive power.

Another feature of the direct drive which commends itself in times of heavy output in manufacturing plants is the ease with which several motors direct-connected to tools can be set up temporarily in a distant part of a shop to handle some rush job that cannot be taken care of in the regular departments.

In regard to the equipment of old tools with electric driving, it is no doubt somewhat cheaper to use the group method, but the application of the individual drive to the old tool is now a comparatively easy problem on its technical side, except where a very great range in speed is required. The recent development of the commutating pole motor enables most cases of forcing the production rate of old tools by separate motor application and the use of high-speed steel to be handled with success.

In a paper and discussion before the National Association of Box Manufacturers at a recent convention, Messrs. F. M. Kimball and L. R. Pomeroy, of the General Electric Company emphasized a number of points which have a direct bearing upon the general problem of electric driving, so that a brief reference to some of these may be consistent with the present survey. One point especially emphasized by Mr. Kimball was the ease with which a check can be kept upon the condition of the tools or machines when driven by direct-connected motors. Wood-working tools, in particular, when out of alignment or carrying dull cutters, may easily absorb 200 per cent. more power than they normally require, and this excess power is not only wasted, but is absorbed in friction and strains which are damaging to the machine. Under such conditions the niceties of adjustment are disarranged and the performance of the machine is liable to permanent injury. By placing an indicating wattmeter in circuit with the motor and observing its reading when the driven tool is known to be in perfect adjustment and alignment, with the cutters in good order, and comparing that reading with subsequent readings from time to time, an abnormal use of power is at once made known and corrective measures may be applied in time to prevent serious injury.

Two distinct systems of distribution are possible, alternating and direct current. There are synchronous and induction motors in the alternating current system. Though some of these are used on machinery they are not so suitable as direct current machines for individual drive.

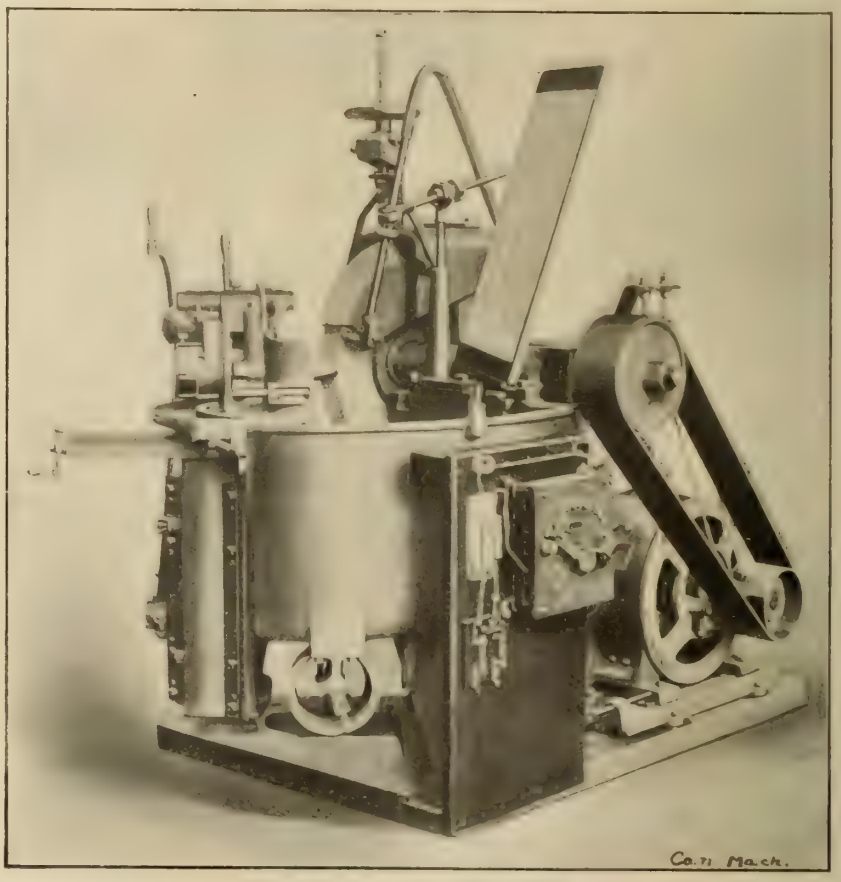

Fig. 2.—Sellers' Motor Driven Grinder.

The direct-current system offers three kinds of motors, the combined characteristics of which cover much more closely the requirements of machine tool drive than do those of the alternating-current

motor. These are the series-wound, compound-wound, and shunt-wound motors.

The series motor is a variable-speed and is an excellent motor for cranes elevators, etc. The shunt-wound motor is most suitable of any for the purposes of machine-tool driving, and either singly or in combination with each other or in combination with gearing, most of such work is now accomplished.

Electrically Driven Tool Grinder.

Perhaps among the first of the equipment in a machine shop to be driven by an individual electric motor in experimenting with electricity as a motive power, is the tool grinder, because it combines so many of the various advantages of electric drive. Tools are sharp ened only at intervals and the load is fluctuating, permitting the outfit to be shut down between jobs and also to take advantage of any decrease in the demand for power. As a grinder has often to be located somewhat apart from the rest of the machinery, it becomes difficult to make the necessary belt connections where a mechanical transmission system is used. With a small motor supplying the power the grinder may be located at any point that convenience demands and the wires run to it without trouble.

The Safety Emery Wheel Company, of Springfield, O., is supplying a 36-in. x 4-in. emery wheel such as is illustrated in Fig. 1, equipped with a standard Westinghouse direct current type "S," 4 h.p. motor. The motor runs at 1175 r.p.m. and drives the emery wheel at 450 r.p.m. The starting device for the motor is directly on the grinder, providing the most convenient method for bringing the wheel up to speed.

The illustration shows a constant speed shunt motor, but the use of an adjustable speed motor is recommended, as the speed may be increased to allow for wear of the emery wheel.

It will be noted that the motor is mounted well out of the way on the extended sub-base of the grinder, and therefore forms a very flexible outfit in that it may be moved as a unit. Two operators can work on the grinder at the same time, as a door provided in the hood in the rear allows grinding there as well as in front. Wator is prevented from splashing over the floor or the motor by the wide pan in front and the apron in the rear.

Wm. Sellers Motor-Driven Grinder.

Fig. 2 is an electrically-driven Wm. Sellers, Philadelphia, universal tool grinder which will grind all manner of cutting tools except those with concave curves and re-entrant angles less than a right angle. It is shown driven by a 7½ h.p. direct current, constant speed type "S" motor of Westinghouse manufacture, running at 975 r.p.m. The motor is mounted on the sub-base of the grinder, and a starting rheostat with fuses and switch is also mounted by the side of the grinder, resulting in a most compact and convenient equipment.

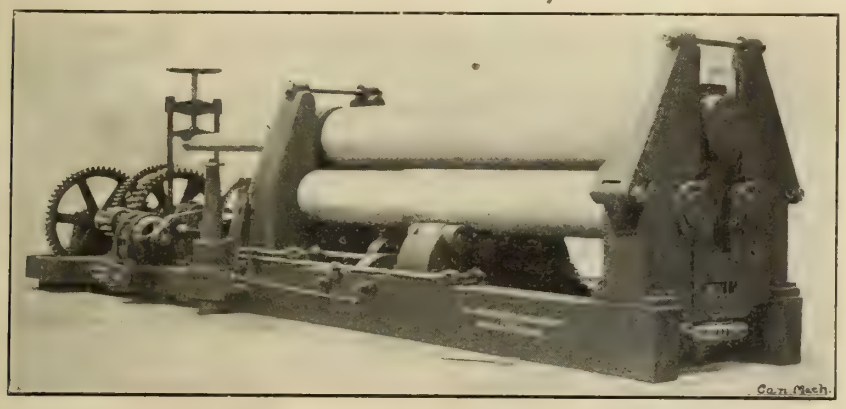

Fig. 3.—Motor Driven Plate Rolls.

A rotary pump driven by the motor forces water to the tool being ground through a system of jointed pipes ending in an adjustable nozzle, furnishing a large volume of water at a low velocity. This arrangement is so made as to prevent the water from splashing and keeps it away from the working parts.

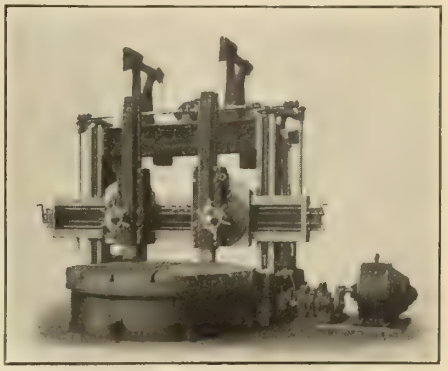

Fig. 4.—Motor-Driven Boring Mill.

Motor-Driven Boiler Plate Rolls.

Fig. 3 is of a boiler plate rolls built by the John Bertram & Sons Co., Dundas, for the Marine and Fisheries Department for the Sorel shipyard. One of the stipulations in the contract was that the rolls should be entirely Canadian manufacture.

The capacity of the machine is a plate 1½ in. thick by 12 feet wide; clearance between housings 12 ft. 4 in.

The machine is so constructed that a plate can be bent to a complete circle and removed by throwing down the hinged parts of the housings, which can be plainly seen in the illustration.

The forged steel rolls were made by the Hamilton Steel & Iron Co., the combined weight of which is 42,000 pounds.

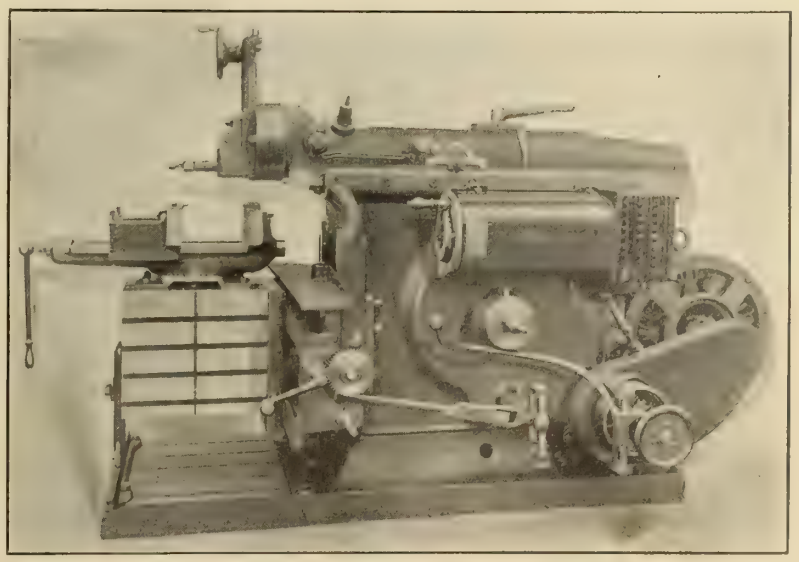

Fig. 5.—Gould and Eberhardt-Shaper Equipped with Westinghouse Motor.

The cast steel driving gears were also furnished by the Hamilton Steel & Iron Co. The other forgings used in the con-

struction of the machine were furnished by the Canada Forge Co.

The machine is motor driven by a 40 h.p. Canadian General Electric variable speed induction motor. For raising and lowering the top roll a 10 h.p. induction motor of same make is used.

Motor-Driven Boring Mill.

The motor-driven boring mill shown in Fig. 4, is a 104 in., manufactured by the London Machine Tool Co. Hamilton. This mill is operated by two D.C. motors. One is connected by gearing to the driving mechanism and the one for raising the cross rail is located on the top of the frame.

Motor-Driven Shaper.

The half-tone, Fig. 5, shows an individual motor-driven shaper connected through a friction clutch so that the machine can be stopped independent of the motor itself. The tool is a 34-in. high duty shaper.

Connection between the motor and the shaper is made by a silent-running chain drive protected by a chain guard. The motor is conveniently located on the rear of the shaping housing which makes the outfit a most compact unit free to be located at any point in the shop. The use of the adjustable-speed motor with this wide speed range does away with the necessity for mechanical speed changes, and gives a greater number of steps than is possible by other methods.

The clutch and brake device is controlled by the long curved lever, shown below the controller. By means of this the shaper may be stopped quickly without stopping the motor. This saves time and lessens the wear and tear on the motor which would rseult if it were necessary to stop and start the motor for every little adjustment. The controller is conveniently located, and all the movements are controlled within easy reach of the operator. The shaper is manufactured by Gould & Eberhardt Newark, N.J., and the motor is a direct-current, adjustable-speed, type "SA" Westinghouse, 5 horse-power. The speed may be adjusted by a drum controller over a range of 400 to 1,600 r.p.m. in a series of 15 forward and six reverse steps. The latter are provided for use in making the preliminary adjustments where it may be necessary to reverse the motion of the ram.

Motor-Driven Table Saw.

A tool for wood-working establishments which is convenient and efficient is the motor-driven table saw manufactured by the Crescent Machine Company, Leetonia, Ohio, illustrated, Fig. 6.

The saw table proper and the saw itself are supported upon a pedestal which also furnishes a frame upon which the mechanism for adjusting the saw and table, and the starting rheostat are mounted.

This adjusting mechanism consists of means for tilting the table and raising or lowering the saw. The former is accomplished by means of a hand-wheel whose shaft bears a worm, with a graduated brass scale and pointer to show exactly the amocnt the table is tilted up to 45 degrees. By means of the other hand-wheel the saw is adjustable in a vertical direction, making the machine adapted for cutting boards of different thicknesses up to 4 inches. The saw itself may be as large as 14 inches, but no larger.

The motor equipment consists of a 3¾ h.p., totally enclosed Westinghouse type "R" motor and a starting rheostat. It is a shunt wound, direct current motor, running at a constant speed of 1,800 r.p.m. on a line voltage of 220 volts. The type "D" rheostat is equipped with an automatic low voltage release and is used for starting only.

The motor is mounted on the extended base of the saw table proper. It is belt

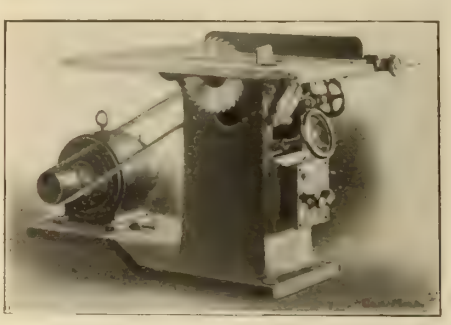

Fig. 6.—Motor Driven Table Saw.

connected to the saw mandrel by a belt which passes through an opening at the back of the pedestal.

A reference to Fig. 6 shows the extreme ease of operation brought about by the motor equipment. The five operating handles are all within a radius of about one foot. The table can be tilted, the saw raised or lowered, the ripping and cut-off fences adjusted and the saw started or stopped without the operator moving a step. The motor is behind the machine out of the way and takes up no space that would otherwise be useful, being beneath the overhanging table. The machine can be located in any position desired, being independent of line shafts. The minimum amount of power is wasted, nothing being consumed by extra belts, countershafts, etc. It should be further noted that a saw of this kind only operates intermittently and the absence of a main shaft and countershaft is thus particularly advantageous, since power is only used when work is actually being done. Altogether, this constitutes a fitting example of the advantages of the motor-drive.

TORONTO POWER RATES.

Following is the schedule of prices to be charged by the Toronto municipal power plant to consumers of over 300 horse power:—

Primary current, alternating 3 phase, 25 cycle, 12,000 to 13,000 volts. 24-hour service.

Maximum Demand in h. p.	Minimum Monthly Bill.	Flat rate per h. p. per month.	—Meter rate per h. p. Hour— Off Peak	On Peak.
300 ..	$344 00	$2 29	$0 71	$0 06
400 ..	425 00	2 12	0 65	0 06
500 ..	506 00	2 02	0 62	0 06
600 ..	588 00	1 96	0 60	0 06
800 ..	750 00	1 87	0 58	0 06
1,000 ..	912 00	1 82	0 56	0 06
1,200 ..	1,075 00	1 79	0 55	0 06
1,500 ..	1 320 00	1 76	0 54	0 06
2,000 ..	1,725 00	1 72	0 53	0 06

Customer may choose either flat rate or meter rate. Rates quoted are net.

Horse-powers intermediate between quotations to be charged the higher of the two nearest rates and to carry a minimum monthly bill pro rata to such intermediate horse-power.

Term of agreement not less than five years, with privilege to customers of changing his monthly guarantee within the limits of this schedule once during first 12 months, and thereafter at 12-month intervals.

Service is to be taken subject to the general rules of the department.

Peak hours are as follows:

October 15 to October 31, 5.30 p.m. to 6.30 p.m.

November 1 to November 30, 5 p.m. to 6.30 p.m.

December 1 to January 15, 4.30 p.m. to 6.30 p.m.

January 16 to February 15, 5 p.m. to 6.30 p.m.

February 16 to March 1, 5.30 p.m. to 6.30 p.m.

Mr, Richard Wallace, late superintendent of the Buffalo Structural Steel Company, has been appointed superintendent of the new bridge shop of the Manitoba idge & Iron Works, Limited, of Winnipeg. Mr. Wallace has a wide experience as superintendent in several of the large American shops in the manufacture of railway bridges and steel structures and will no doubt, be an important factar in developing this business at Winnipeg.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

ANNUAL CONVENTION OF A.F.A.

The coming convention of foundrymen, to be held in Cincinnati during the week of May 17, promises to eclipse all previous efforts both as to profitable discussion of foundry practice and exhibits of up-to-date appliances.

The headquarters of the American Foundrymen's Association will be the Sinton Hotel, 4th and Vine Sts., while the Grand Hotel, 4th and Central Ave., will be the headquarters of the Associated Foundry Foremen.

Music Hall, located at 12th and Elm Sts., has been secured for the exhibit, which will be held in the south wing known as Horticultural Hall. The great exhibition of working foundry machinery and equipment prepared by the Foundry and Manufacturers' Supply Association, and under the able guidance of Mr. C. E. Hoyt, who is secretary of the Foundry and Manufacturers' Supply Association, and also the Associated Foundry Foremen, will be open the entire week.

Arrangements have been made by the Associated Foundry Foremen of Chicago and vicinity for transportation accommodations for those desiring to attend. Other organizations including the Milwaukee Association and the Tri-City Association of Rock Island, Davenport and Moline, have signified their intention of sending delegations to accompany the Chicago members.

The past year has witnessed many changes in foundry practice, improved molding machines and equipments, which have reduced foundry costs very materially. Many melting furnaces have been introduced recently and these and many other improved lines will be exhibited at the Cincinnati convention.

Convention Program.

Tuesday, May 18, at 2 p.m.

Address of welcome.

Address by Lawrence L. Anthes, President A.F.A. Address by Chas. J. Caley, President American Brass Founders' Association.

Reports of committees A.B.F.A. and A.F.A.

Tuesday evening is "Get Together Night" at Hotel Sinton and is for visiting foundrymen and their lady friends.

A.B.F.A. Wednesday May 19, at 10 a.m.

The following are the papers to be presented: "The Manufacture of Brass Ingots, their Uses and Advantages," by W. M. Corse; "The Use of Waste Heat," F. W. Reidenbach and "The Patent Situation in the United States," C. H. Clamer.

Papers of the A.F.A., 10 a.m.

"The Cost of Steel Melting in Foundries," Dr. Bradley Stoughton, illustrated with lantern slides; "The Side Blow Converter for Steel Castings and its Operation," J. S. Whitehouse; "Open Hearth Methods for Steel Castings," W. M. Carr; "Notes on Air Furnace Construction for Malleable Castings," W. H. Kane; "The Use of Pulverized Coal for Foundry Purposes," R. K. Meade; "Molding Machines versus Hand Molding," Geo. Muntz; and "Pattern Shop Equipment," A. N. Spencer, illustrated with lantern slides.

Papers of the A.F.A. 2 p.m.

"The Heart of the Foundry as Seen by the Foundry Engineer," D. S. Hawkins; "Cores and Core Making," F. K. Cheney; "Continuous Melting in the Foundry of the Westinghouse Air Brake Co.," S. D. Sleath; "Continuous Melting," R. H. Probert; "The Permanent Mold," E. A. Custer, illustrated with moving pictures showing the production of castings in permanent molds; "The Practical Value of Chemical Standards for Iron Castings," Dr. J. J. Porter; and "Pyrometry in the Annealing Room," S. H. Stupakoff.

Papers of the A.B.F. 2 p.m.

"General Principles of Operation of Industrial Pyrometers," C. H. Wilson; "Notes on Brass Melting," Chas. T. Bragg, and "Melting of Brass Turnings in the Oil Furnace," E. H. McVeen.

Papers of A.B.F.A., Thursday May 20, at 10 a.m.

"Electrolytic Assay of Copper," Geo. L. Heath; "A System of Distributing Waste Losses in Raw Materials to the Cost of the Finished Product," L. W. Olsen; and "The Tensile Strength of Zinc-Aluminum Alloys," W. D. Bancroft.

Papers of the A.F.A. at 10 a.m.

"A Comprehensive Foundry Production Tally," C. E. Knoeppel; "Foundry Costs," B. C. Franklin; "Specifications for Foundry Facings," H. F. Frohman; "Foundry Transportation Methods," David Gaehr; "Modern Cupola Practice," J. C. Knoeppel; and "Use of Steel Scrap in the Cupola," C. R. McGahey.

The business session of the A.F.A. and A.B.F.A., for the election of officers, will be held in separate halls at the conclusion of the morning session.

Thursday Afternoon and Evening.

Boat ride on the Ohio river and barbecue at a noted Kentucky pleasure resort.

The Exhibitors and Exhibits.

OSBORNE MANUFACTURING CO., CLEVELAND, OHIO, will exhibit its well-known line of brushes, brooms, bellows, rammers, "Economy" wire wheel brushes, and general foundry supplies. Among the new items appearing in this exhibit will be the Osborn rockover drop draft moulding machine, this being the machine invented by Henry M. Molder, manager and superintendent of the Best Foundry Co., Bedford, Ohio. We will also show the "Sivquick," ordinary foundry riddle, which is made of an entirely new design, the wire cloth being formed into a basket with flaring sides, which more than doubles the sifting surface of the riddle. It is a recently patented article, and placed on the market for the first time during the last 30 days. Booth 34 and 35.

ARCADE MFG. CO., FREEPORT, ILL., will exhibit the latest models of No. 1 and No. 2 Modern Molding Machines. These will be equipped with pneumatic vibrators and automatic trip adjustments. They will have a number of new features of great interest. There will also be a demonstration of Buck's Roll-Up Device, which is achieving wonderful results in stove foundries. Perhaps the most sensational feature will be the exhibit of the Norcross jolting machine which is designed to ram molds weighing up to 20,000 lbs. They will exhibit also a large number of castings that are being made by prominent manufacturers in the U. S. and Canada. Booths 30-33.

The Music Hall, Cincinnati where the Foundry Supply Exhibition will be Held.

FALLS RIVET AND MACHINE CO., CUYAHOGA FALLS, OHIO, will exhibit the following list:—1 Wadsworth combined sand mixer, compound and riddle; 1 No. 1, No. 2 and No. 3, Wadsworth improved core making machine (in operation); 1 Wadsworth core oven (baking cores); 1 Wadsworth core cutting off and coning machine; 1 Gagger mold with sample gaggers. Samples of various sizes and shape cores. Cabinets with the Wadsworth standard core prints. This is a working exhibit and will be run by electric motor, and will be in booth 119-122, first floor of the Exhibition Hall.

W. W. SLY MANUFACTURING CO., CLEVELAND, OHIO, will exhibit a model cinder mill machine. The balance of exhibit will consist of photographs, literature, etc. Booth 89.

DETROIT TESTING LABORATORY, DETROIT MICH., will have booth No. 116 on the second

floor of the convention hall, where they will receive their friends and customers.

CANADIAN MACHINERY, TORONTO, CANADA, will occupy booth 123 where they will be pleased to meet all their old friends and many new ones. H. V. Tyrrell and W. E. D. Wilkes will be in attendance.

WHITING FOUNDRY EQUIPMENT CO., HARVEY, ILL., will exhibit at booth No. 77-81, the following articles:—Tumblers, hoisting machine, standard ladles, shank, turnable. They also intend to have photograph stand showing their latest cranes and equipment.

CARBORUNDUM CO., NIAGARA FALLS, N. Y., will exhibit corborundum wheels. All grits and grades of wheels will be shown and the following representatives of the Carborundum Co., will be on hand, George R. Rayner, W. W. Sanderson, H. A. Eaton and R. B. Fuller. Booth 38.

HILL & GRIFFITH CO., CINCINNATI, OHIO, will exhibit a number of articles in the foundry supply and equipment line, among which are mentioned the following: A full line of peerless perforated chaplets, upon which we have patents and of which we are sole manufacturers. The Linn steel coated taper flask, molders' flat black shovels, patent portable core oven, sand sifters, full line of smooth-on cements and specialties, crucibles, foundry brushes, bellows, riddles, etc. Booths 72, 73 and 74.

OSCAR BARNETT FOUNDRY CO., NEWARK, N. J., will exhibit iron flasks of various types and sizes for all foundry purposes.

DIAMOND CLAMP AND FLASK COMPANY, RICHMOND, IND., will exhibit an automatic core machine for making all kinds of special cores, such as fitting cores, valves, T's, etc., a plunger type core machine for making stock and irregular shaped cores, a screw type core machine for mRaking stock and irregular shaped cores; a core cutter for cutting standard cores, a core coner for coning standard cores, the diamond snap flask and slip jacket, asbestos core plates, adjustable flask clamps, patternmaker's bench trimmer, pattern maker's two jawed lathe chuck, dowel pins, etc. Booth 104.

BROWN SPECIALTY-MACHINERY CO., CHICAGO, Ill., will exhibit the hammer core machine, also cabinets for same and core tapering machine, machine in operation, making round, square and irregular shaped cores. Booth 101.

KROESCHELL BROS. CO., CHICAGO, ILL., will consist of an exhibit of a complete installation of the crucible furnace with both oil and gas used as fuel, all in working condition. This equipment will consist of a stationary crucible furnace, oil pumping and blower system, and tilting crucible furnace. Mr. Schwartz, the inventor of the Kroeschell Schwartz crucible furnace, and W. L. Kroeschell will be in attendance. Booth, temporary building.

DETROIT FOUNDRY SUPPLY CO., DETROIT, MICH., will occupy booth 95 which is in the gallery near the band stand. This booth is for the use of foundrymen and their ladies as a resting place, from which they can get a good view to all parts of the hall.

FOUNDRY SPECIALTY CO., CINCINNATI, OHIO, will exhibit at the Foundrymen's Convention, their parting material, partine, and brass flux, fluxine. Booth 73.

JONATHAN BARTLEY CRUCIBLE CO., TRENTON, N. J., will exhibit all types of regular crucibles together with specials used in the Tilting Furnace. Their new catalogue of their manufactured goods will be distributed. This will contain "Hints on the use of crucibles," "Graphite and Mining in Ceylon," Jonathan Bartley and L. H. Lawton will be at the convention. Booth 84.

THE FOUNDRY, CLEVELAND, O., will occupy booths 78-80 at the convention.

HERMAN PNEUMATIC MACHINE CO., Pittsburg, Pa., will exhibit the following machines at the Cincinnati Convention: 1 60"x72" Herman jarring molding machine, to be used for ramming large molds. Weight of which will be over three ton; 1 small machine, table place 24"x30" complete with turnover and pattern drawing device. We will also exhibit a novel ladle barrow, and roll over device for handling large molds. This roll over device can be applied to any flask. Booth, temporary building.

MONARCH ENGINEERING CO., BALTIMORE, MD., will exhibit a Steele-Harvey furnace, Monarch core oven, Monarch portable heaters, low pressure blowers, ladle heaters, stationary furnace, etc. H. D. Harvey and others of the company will be in attendance. Exhibit in the temporary building.

ROCKWELL FURNACE CO., 26 CORLANDT ST., NEW YORK, will make a complete exhibit of melting furnaces, including lift-out type of crucible furnace, tilting crucible and simplex and double melting furnaces. These furnaces including a ladle heater, will be operated with a fan blast of 12 ounces. There will also be shown a soft metal melting furnace and an annealing, hardening and tempering furnace; compressed air and self-contained type of portable heaters for skin drying molds and other heating work. This exhibit will be to the right of the entrance going from the Music Hall to the temporary building.

OLIVER MACHINERY CO., GRAND RAPIDS, MICH., will have on display and under running demonstration the famous Wadkin Universal Woodworker. There will be made on the woodworker, any pattern on any core that the representatives desire.

J. D. SMITH FOUNDRY SUPPLY CO., CLEVELAND, will exhibit a working battery of three natural draft furnaces, a new style core oven, a Cleveland sprue cutter, a Cleveland molding machine, a Cleveland water tumbler, a wall crane serving the furnaces, etc. Booth, temporary building.

E. H. MUMFORD CO., PHILADELPHIA, will have a joint exhibit with Curtis & Co., Mfg. Co., St Louis, showing the Curtis-Mumford Overhead Molder, which is a suspended mechanism by which large flasks jolt-rammed on an arcade jolt-ramming machine will be lifted and rolled by power and the pattern drawn from the joint while the mold is suspended. They will also have a new 10" high trunion power squeezer, and a standard power ramming split pattern vibrator machine on exhibition.

The above list is very incomplete but it will serve to show what may be expected at the convention. Other exhibitors will include Oscar Barnett Foundry Co., booth 117, Berkshire Mfg. Co., 8-9, S. Birkenstein & Sons, 21, A. Buch's, Sons Co., 60-67, Geo. F. Crivel & Co., 96, Curtis & Co., Mfg. Co., 56-58, Detroit Foundry Supply Co., 95, Dixon Crucible Co., 75, Hickman-Williams Co., 82, E. Killings Molding Machine Works, 57-59, Walter Macleod & Co., 52-54, E. H. Mumford Co., 56-58, J. W. Paxton & Co., 88, Pickards-Brown Co., 83, H. E. Pridmore, 25-27, Robeson Process Co., 68-71, Sterling Wheelbarrow Co., 118, Tabor Mfg. Co., 36-38, and Calumet Engineering Co.

The secretary of the Foundry and Manufacturers Supply Association is now at convention headquarters. His address is C. E. Hoyt, Hotel Sinton, Cincinnati.

Part of a Battery of Twelve Fisher Furnaces being Installed in the Plant of the Clayton & Lamber Manufacturing Co., Detroit.

FISHER CRUCIBLE FUEL OIL METAL MELTING FURNACE.

The inventor, Mr. Alfred Fisher, of Lewiston, Maine, first entered into the foundry of Henry Lowell, of Manchester, N.H., Oct. 16 1880, 26 years ago. After serving his time of four years as a molder, he spent two years following at Amoskeag Foundry, the same city, working on machinery castings. He then went west to Chicago where his experience was broadened by entering the plant of the McCormick Harvester Co., at which place the first experiments were then being made by them with crude oil as a fuel for forging.

This demonstrated to his satisfaction that the same could be used to good advantage in carrying on experiments with his brass melting furnace, using a crucible. Then came three years' trouble perfecting a cover which would protect the operator from the intense heat while in operation and which would serve as a feeder for crucible as well. In order to make a still greater saving of time and fuel and permit the metal to be brought up to its proper heat quickly, a second cover was then found necessary. A drop bottom was then added in case the furnace clogged up with a very heavy slag, which could be removed with ease by operator. These are the features of the Fisher furnace.

In a great many large foundries there is shown a neglect in not properly instructing the melters. After filling the crucible with yellow brass borings, they then add two ingots of copper. It takes 1,900 degrees of heat to melt copper and only 1,400 for yellow brass. In alloying these metals, copper should melt first, adding the borings gradually.

One great advantage in using an oil fuel furnace is that it is always ready for use. An oil fuel furnace is ready in two minutes, thus averaging the required temperature nine hours out of every ten. The operating cost of this furnace is 6½ cents per 100, figuring crude oil at 4 cents per gallon, melting any kind of metal you wish from copper to scrap sheet zinc.

The accompanying illustration shows a part of a battery of twelve Fisher furnaces, being installed in the plant of the Clayton & Lambert Mfg. Co., Detroit, Mich.

Mr. Fisher makes a rather unique proposition, demonstrating his confidence in his furnace by offering to instal in the plant of any Canadian foundry, a furnace on trial with no obligations whatever on the part of the party accepting his offer.

These furnaces are manufactured by Alfred Fisher, 103 West Munroe St., Chicago.

Arranging Molds in Groups to Lessen Cost of Production

Some Foundrymen Encounter Difficulties in Production which may be Overcome by Multiple Core Molds which are Described in this Article.

By H. J. McCASLIN

To satisfy delivery and meet present day prices steel foundrymen encounter many trying and exacting problems in the production of certain castings.

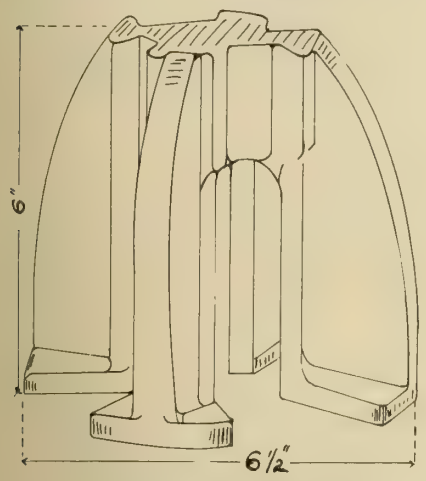

Fig. 1.—Mold with Similar Parts.

These conditions may be due to the lack of equipment or the number of castings not warranting the fitting up of a machine, or perhaps as often is the case a dry sand mold is preferable.

It might be further stated that pouring small individual molds from a bottom or stopper pouring ladle, or rehandling the metal in a bull ladle is not always profitable. This may be more truly said in the pouring of snap flask molds by the former method, which, owing to the pressure of the metal entering the mold, they require special arranging and backing up.

One of the many ways devised and

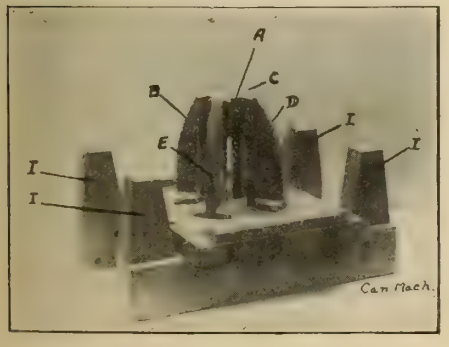

Fig. 2.—Assembled Pattern.

employed to accomplish the desired result, is the multiple or group method of arranging core molds.

As the name implies, the metal or formation of molds consists of the stacking or grouping together a series of cores containing impressions of the object to be cast. The gates are so arranged that the series of molds thus formed are poured from the same runner.

In the production of similar objects to that shown in Fig. 1, which must be removed from the sand in sections, the core mold has a decided advantage. This is particularly due to the adhesiveness of core sand and the accessible form of a core before or subsequently to the removal of the frame or box.

Discussing the molding of the object here illustrated, Fig. 2 shows the assembled pattern upon the bottom board and illustrates the arrangement and position of the five pattern parts, A, B, C, D, E, shown in Fig. 3. Also shown in the illustration is a conical core print, F, which is attached above part A, as shown in a partially assembled view of core box, Fig. 4.

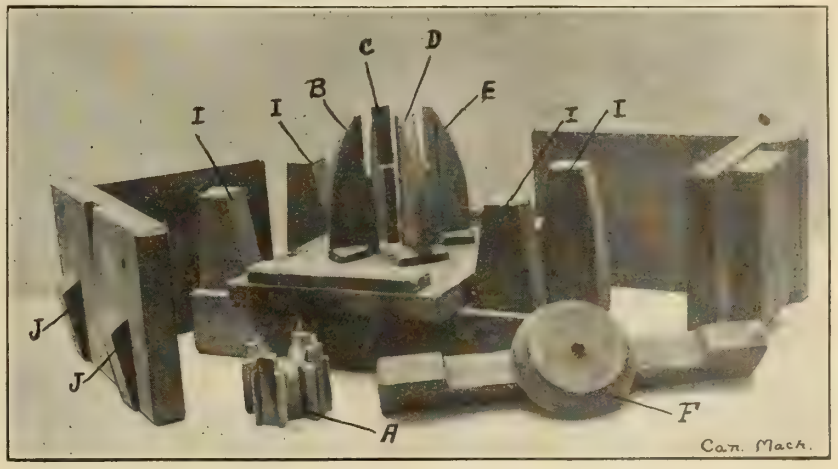

Fig. 3.—Fine Pattern Parts.

The object of the core print F above part A is to form an opening through which part A may be removed from the sand. The depression formed by this conical print is subsequently closed in setting the cores by a corresponding projection of sand formed by the depressions in the molding block H, Fig. 5.

The form of the object to be cast will, of course, determine the formation of the cores for pouring. In this case take a rectangular form consisting of eight molds, grouped together within a depression formed by molding up the block H, Fig. 5, in the same manner as that of a pattern. Note the manner of gating, the individual molds form a runner core at the centre of group.

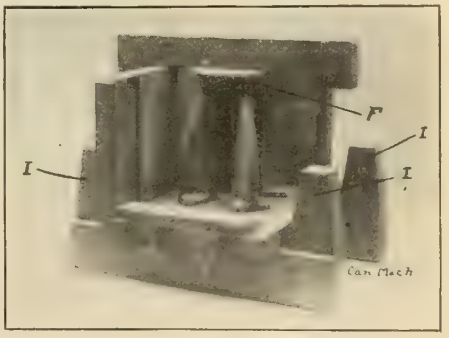

Fig. 4.—Partially Assembled Core Box.

The runner core is made from the same box as that of the molds, by simply substituting a runner pin in place of the pattern. Figs. 3 and 4 are also illustrative of a very handy and convenient core box clamp, the utility of which will be

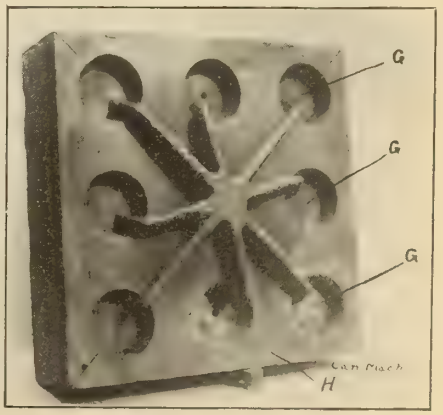

Fig. 5.—Molding Block.

readily appreciated. The assembling of a box equipped in this manner requires no more effort on the part of the core-

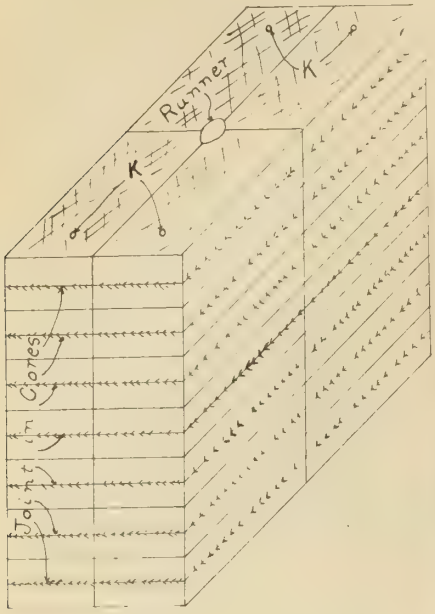

Fig. 6.—Combined Grouping Formation.

maker than that of a plain box, and it eliminates the use of dogs or clamps, say nothing of their destructive tendency.

The arrangement of the clamp simply consists of attaching to the protruding ends of the bottom board cleats, wedge shape uprights, as shown at I, and to the sides of the box opposite these uprights corresponding wedge shape pieces, J. The assembling of the box upon bottom board bringing these wedge shape surfaces together forming a positive clamp. A diagramatical outline of a combined grouping and stacking formation is shown in Fig. 6.

This arrangement readily applies itself to rectangular cores, the runner be-

Fig. 7.—Six Large Ring Castings.

ing formed at their intersecting corners as shown. In this instance the core is made in halves and dried, being pasted together if desired, but which is not always essential. With the two opposite cores of each series inverted in order to form the runner, the cores are stacked up to about four feet high.

Provision for pouring may be made by clamping the cores together or placing them within a curbing and backing them in with sand. To allow for the escape of the air or gas caused by the inflow of metal, a good vent must be provided. This may be carried up through or from core to core as shown at K.

In the production of large diameter rings the segmental construction of multiple molds is resorted to with very good

Fig. 8.—Cores Ready to be Assembled.

results. This may be particularly said when it is desired that they be cast from the same heat, as it would not take many ten or twelve-foot diameter molds to place floor space at a decided premium, if you should be fortunate enough to have any number of such size flasks at your disposal. At a glance one would be inclined to think the cost of

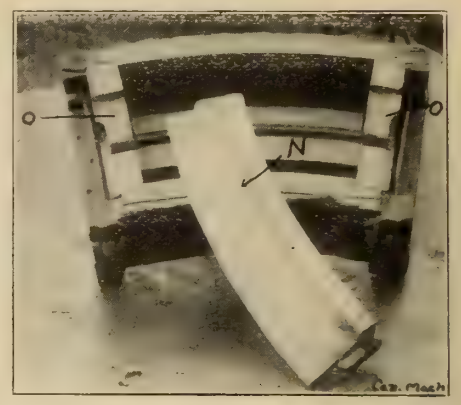

Fig. 9.— Corebox.

production would be greater than if molded upon the floor with pattern in the ordinary way, which, however, is not the case. The hours of labor required in making and setting the cores, and the cost of material used will show a very good margin.

Fig. 7 shows six large ring castings intact as they were delivered from the foundry to be separated and cleaned.

With the exception of the top and bottom ring of cores, all adjacent rings contain a half impression of ring upon each side. It will be readily understood that in the stacking of the cores these half impressions come opposite, forming a complete section of ring.

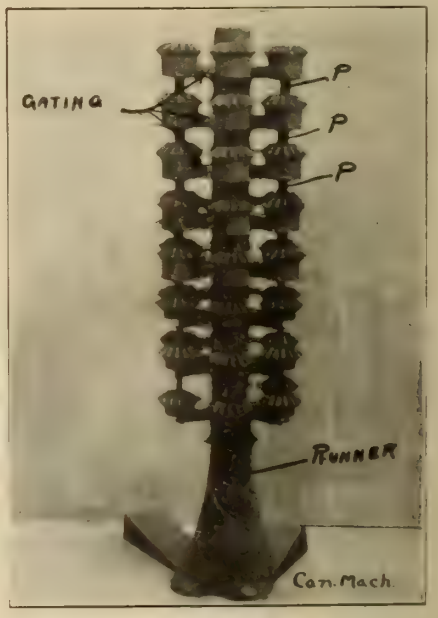

Fig. 10.—32 Bevel Gears.

Fig. 8 shows a number of cores upon the floor ready to be assembled within the pit. The forming of the four risers I Fig. 7,, about the inner diameter is done during the packing in of sand, holes being provided, as shown at M, Fig. 8,

in each series of cores at the desired intervals at which points the runner blocks are rammed up. Upon one of the riser openings, the runner core is placed, the metal entering the mold in this way.

Fig. 9 illustrates the core box from which the cores are made. As the upper and lower surface of this core contain a part impression of the ring to be cast, the box, of course, is made accordingly. This necessitates bedding in at the top of the box a pattern or form as shown at N. Owing to the rough usage to which this part is subject, it is made of metal of about one quarter-inch thickness.

To locate or guide it into its correct position while being rammed and bedded, in the ends of the box are cut out, as shown at O, to coincide with the contour of form. If accuracy has been maintained in laying out the radial ends of the core box and about 3 -64 of an inch allowed at each end of the box for the swelling of core, they should form a complete circle when setting. That the setting of each tier of cores may be tried for accuracy during their assembling and stacking, a gage board is attached to and revolved about a spindle similar to a sweeping operation.

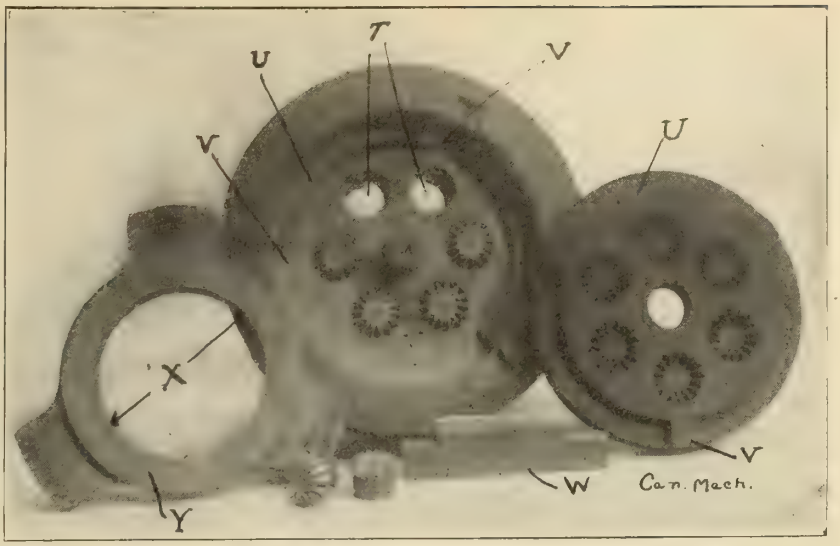

Fig. 12.—Molding Bevel Gears.

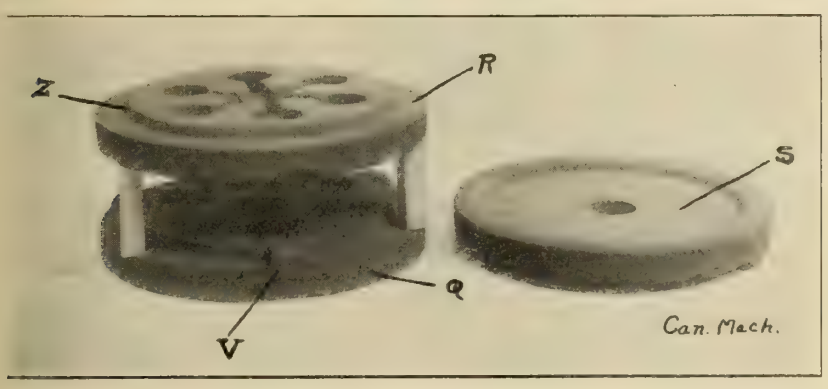

Fig. 11.—Box Construction.

Especially adaptable to this method of molding is small level gears as shown in Fig. 12. The gears herewith shown were not intended for patterns, but are steel cut gears taken from stock, and wood plugs inserted in the bores. Owing to the number used and the expensive method of production it was decided to cast them of steel, which was satisfactorily accomplished, as shown in Fig. 10. This illustration shows a group of 32 intact castings as they came from the foundry. For convenience in plotographing they are shown in the reverse position to that of casting.

Connecting the gears at their centre can be seen the tie bars, P, formed by the vent channel between the adjacent molds for carrying off the air and gases.

Before discussing the arrangement of the two core boxes from which the cores are made, note the form and manner in which the cores Q R are set together, Fig. 11 will give a good idea as to the box construction. Blocking the two cores apart in this manner is simply done for the sake of clearness, and to give a good idea how they drop upon one another.

Core Q, within which the face of the gears are formed, is made from the box shown in Fig. 12 and 13. Fig. 12 illustrates the disarranged box, showing how openings, T, are cut out to receive the six gears. It also illustrates the manner of forming the offset joint, U, and the marker V. upon cores, that they may match up correctly during their assembling. The strike W is employed in striking out the surplus sand from the opening X in the top frame Y. This frame forms a corresponding offset to that shown at Z, Fig. 11, or a surface to receive core R.

Shown at the centre of box is the runner A. For forming core R, as shown in Fig. 11, which contains the hub of gears and also the gating, the core box shown in Fig. 14 and 15 is employed.

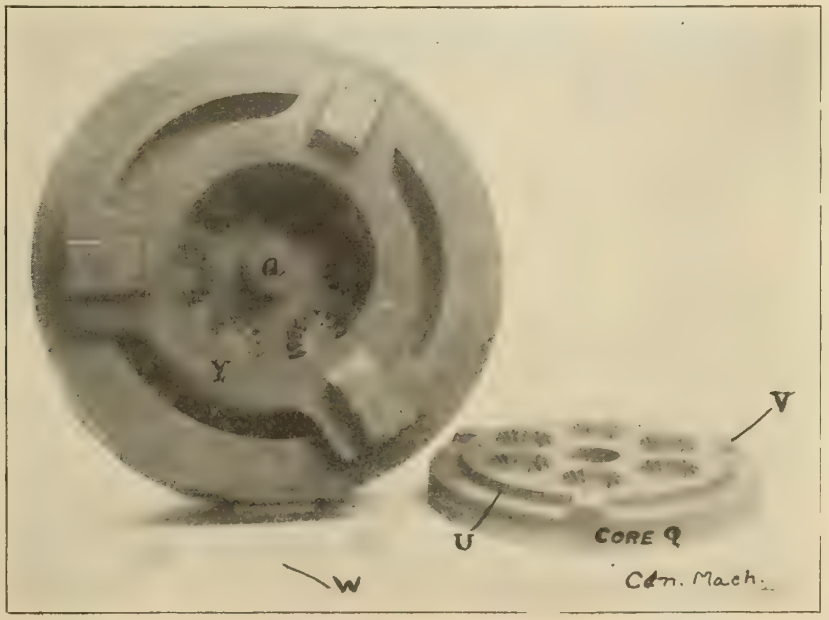

Fig.13.—Corebox.

While very similar to the box used in forming core Q, a few remarks may not be amiss. The six hubs, b, are turned up and secured in place with a centre dowel, as also is the runner and gating c. The depressions thus formed within this core are more clearly shown to the right of the box, Fig. 14, which shows very plainly the manner of gating into the hubs.

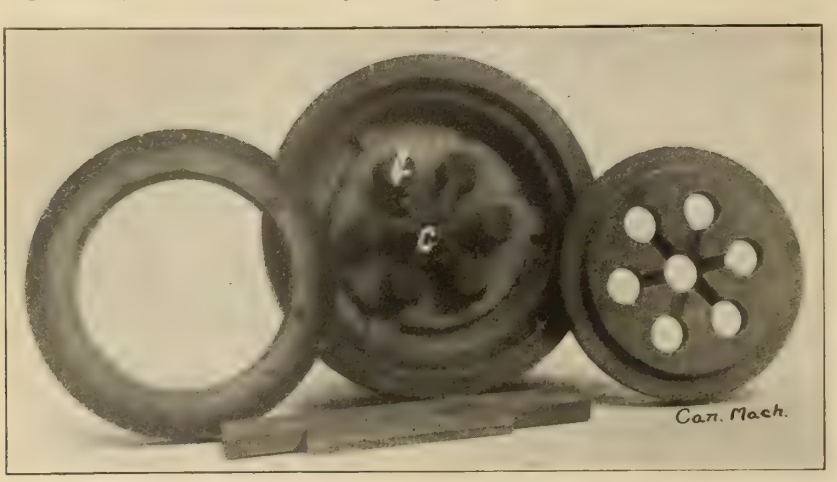

Fig. 14.—Corebox.

Core 5, Fig. 11, one of which is used at the top of the series of cores for closing up the uppermost mold, is made from the box shown in Fig. 12 and 13 by simply filling up and slicking off the impression of face of gears.

In preparing the molds for casting, the cores are stacked and backed in with sand within a series of suitable flasks, and poured in this manner.

NEW ENTERPRISE FOUNDRY

The Enterprise Foundry Co., Sackville, N.B., have opened their new stove works which replaces the plant that was completely destroyed by fire, July, 1908. This company was established in 1887, and has shared in Canada's industrial development.

The fire came at the worst possible time, in view of the fact that the company had an immense stock of stoves, ranges and furnaces made up in preparation for fall trade; and most discouraging of all, their carefully-selected and costly stove patterns were included in the ruin.

Less than two months after the fire, the Enterprise Foundry Co. started rebuilding on the old site, the magnitude of which may be gained from the fact that over 1,000 tons of stone and 553,000 bricks were used in its construction, and that it covers an acre and a half, leaving about the same amount of land for further extension.

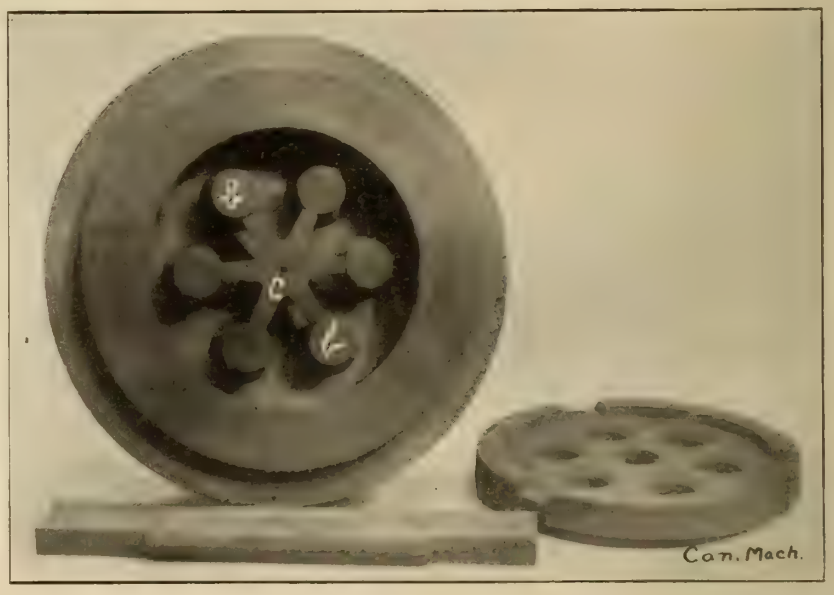

Fig. 15.—Corebox.

Fig. 1.—Interior View of the Enterprise Foundry

Plans for the new buildings were prepared by H. H. Mott, architect, and building operations were begun on September 10. The work of construction was carried on by J. E. Lusby, Amherst, contractor.

The Buildings.

The buildings, which are ranged in the form of a hollow square, as shown in the view given, are of brick and all one storey with the exception of the warehouse. The floors throughout are of concrete, covered in some cases with wood to facilitate working upon them. Substantial fire walls extend through the roof, separating the different departments, so that in the event of a fire occurring in any one building, it can be prevented from spreading to any of the others, the heavy tin-lined doors shutting off all communication.

The power-house is in the centre of the big square, apart from the other buildings. A Robb-Mumford return tubular boiler, built by the Robb Engineering Co. has been installed. The engine is a Corliss type of 150 h.p., manufactured by Goldie & McCulloch, Galt.

Adjoining the power-house is the carpenter and pattern shop, separated from it by a fire wall. It is equipped with the necessary saws, surfaces, etc., for pattern work. Since the fire a large staff of pattern-makers have been preparing patterns for the lines of stoves manufactured by the Enterprise foundry.

Fig. 2.—Enterprise Foundry —Erecting Department.

Molding Shop.

The molding shop is 200x65 feet, and is fitted with the most modern devices procurable to lighten labor. Although adjoining the moulding shop, the cupola house is in reality entirely separated. It is 40x20 feet, and is connected with the yard by an inclined railway, through which are drawn the supplies of coal and iron. The cupola's melting capacity is seven tons of iron an hour, and frequent tests of the melt are made by analysis to ensure the castings turned out being smooth and tough.

Fig. 1 is a view of the foundry and gives an idea of its size. As the cupola is in a separate building, as explained above, it is not shown in the photograph

Enterprise Foundry—Finishing Room.

The cupola is 40 ft. high and 6 ft. diameter. Surrounding the cupola is the stage or charging floor which is constructed of reinforced concrete.

This is one battery of six mills running from 24-in. round to 48-in. square and another similar battery is being installed. A Sturtevant blower, connected to each mill by galvanized piping draws off all dust and keeps the mill room perfectly clear.

Finishing Department.

When the castings are taken from the mills, all defective pieces are rejected and the perfect ones are then ground off and are ready for mounting. In the mounting and finishing shops, which are 150x70 feet, the process of making the complete and perfect stove is further advanced, each piece being carefully fitted and bolted into its proper place. In this department also is the machinery for constructing Enterprise Monarch Steel Ranges. The steel sheets are cut, bent, punched and riveted, all by heavy machines, no heat being used at any stage of the process. The necessary copper and tin-work are also carried on here, each part being examined to see that it is perfect in workmanship, fit and finish, before continuing in its forward course.

Next in the chain of buildings comes the plating room, 50x50 feet, where the platers take the plain black castings in hand; and after many immersions in the different tanks and baths, produce brilliant plated work.

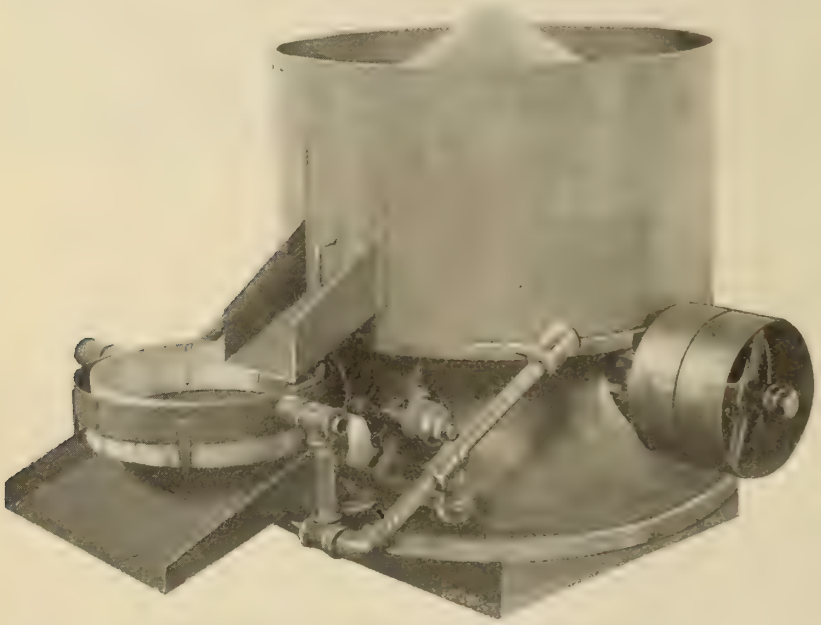
Then comes the final process of cleaning and crating, which is done in a building 50x25 feet, before removal to the warehouse where the completed stoves are stored until required for shipment. The warehouses are two-storey, to give greater capacity for storage, and the various entrances open out on a siding of the railway which runs into the works; so that the raw materials are deposited and the finished product loaded directly on cars for shipment.

The officers of the Enterprise Co. are: W. S. Fisher, president; R. B. Emerson, vice-president; F. A. Fisher, manager; and A. E. Jubien, secretary.

WADSWORTH SAND-MIXING MACHINE.

The machine shown in the accompanying illustration consists of an ordinary roller mill in which two rollers weighing several hundred pounds each, travel around in a circular path upon the cast iron base plate, the rollers being driven from the driving pulley shown on the right, by means of a vertical shaft and a set of bevel gears.

In the centre of the casing surrounding the machine there will be seen a metal cone which serves two purposes: first, it protects the upper bearing of the shaft carrying the roller driving mechanism, in fact, the cone is attached to this mechanism and revolves with it; second, it serves to distribute the sand when it is shoveled or dumped into the machine, so that it will fall where



Wadsworth Sand Grinding and Compounding Mill

it will be immediately acted upon by the rolls.

Between the rolls are two scrapers which throw the material from the edges of the pan under the rollers. A batch of material is introduced into the machine while it is in motion and ground with the addition of the necessary binding material. Where flour is used it is mixed with the sand when the material is first introduced into the machine. If core oil is to be used, this is added next, and lastly, the proper amount of water.

Mr. Wadsworth has always recognized two classes of binders, particularly in the case of core sands for core machine work. For holding the sand together previous to baking, he has recommended a binder having a sticky nature like flour. For holding the sand together after baking, he recommends the use of core oil, linseed oil glutrin or some other liquid compound. His standard mixture was formerly composed of 12 quarts of sand, one-half pint of boiled linseed oil and two quarts of flour. Later he substituted silica dust for the flour.

When using the machine he has found it possible to cut the silica dust or flour in half, using only one quart of this in the mixture, but has not found it possible to cut down the oil binder. Of course, this mixture is made entirely of new sand.

Several other points in connection with the machine which are worthy of note are as follows: After the charge has been mixed, the gate shown in the front of the machine is opened, when the scrapers and rollers force the charge through the inclined spout into the riddle. This riddle is only operated while the machine is discharging, the mechanism being held out of contact with the cam at other times by means of a clamp controlled by a small wheel conveniently located.

This machine gives Mr. Wadsworth a complete line of core room equipment, the same being now manufactured by the Falls Rivet & Machine Co., Cuyahoga Falls, Ohio.

METAL MARKETS.

The aggregate volume of business done during the month has been very good. Trade fell off around Easter, but picked up afterwards splendidly. All metals with the exception of copper have moved well and copper has not done so badly, considering that it has suffered from uncertain conditions in New York. Despite a shading in copper for large quotations, ordinary jobbing lots are still at 14c. The primary markets all the way through have not been in the best of shape, and local quotations have received no help from them. Tin has advanced during the month owing to stronger figures in the primary markets, and good home trading, and quotations for jobbing lots are now round 32½c. Inquiries are good, and plenty of new business is near at hand. Speculation in the English market has been very quiet somewhat unusual for tin. Spelter has been remarkably firm all through the month, and jobbing prices advanced 25c making quotations $5.75. Business is good with stocks on the light side. Lead advanced 10c during the month, and is now quoted at $3.75, and Trail at $3.65. Business is good, but the market is not so strong as it might be owing to sagging in the English market.

There was a fair demand during the month for pig iron, although consumers were compelled to pay somewhat higher prices than they did a few weeks ago. The Eastern furnaces being in receipt of good orders for steel, practically withdrew from the pig iron market during the month—the result being a stiffening in the prices of other furnaces. Heavy consignments of imported iron are expected during May, in fact much heavier tonnage than for the same month last year. Open-water prices are now being quoted for imported pig.

Iron and steel conditions are much brighter in the Old Country. Exportations have improved as well as the home consumption. While pig iron in the States is dull, there has been a decided improvement in finished steel orders. Prices are far from being uniform, but they are being held better than at any other time since the open market was declared.—J. F. A.

Matthew Morton, founder and president of the Morton Mfg. Co., Muskegon Heights, Mich., died at his home in that city on March 10, from pneumonia. Mr. Morton was a native of Scotland and was born in Ayrshire, May 5, 1836. He invented a great number of machines and developed and perfected the machines built by the Morton Mfg. Co. The last years of his life were devoted to the perfection of a special railroad draw-cut shaper for slotting axle boxes, planing axle box brasses, shoes and wedges, rod brasses, and a great variety of other work. This machine is already recognized as the most efficient equipment for the work that has been offered and one is installed in the Stratford shops described in the April issue.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Machine Shop and Foundry.

Clatworthy & Co. will erect an $8,000 machine shop at Toronto.

W. C. Belina is opening a machine shop at Cartwright, Man.

The Otis-Fensom Elevator Works will enlarge their plant at Hamilton.

The Whitman & Barnes Mfg. Co., St. Catharines, is erecting a forge shop.

T. E. Reeb has purchased the foundry and repair shop of A.H.B. Neff, at Welland.

The Hamilton Bridge Co., Hamilton, will shortly start work upon several additions to their plant.

The Joseph Bowman structural steel concern may locate in Sherbrooke if that city grants certain concessions.

A permit has been taken out for a $5,000 brick addition to the Canada Steel Goods Company's factory at Hamilton.

Brock & Flaws, Cookshire, Que., have disposed of their iron working machinery and buildings to Sargeant Brothers.

The Capital Scale, Brass & Iron Foundry Co., Ottawa, Ont., have purchased a site for the erection of a new factory.

A. C. Rioux, for some years with the Massey Harris Co., has located in Claresholm and will open an up-to-date machine shop there.

A machine and repair shop is to be established in Selkirk, Man., this spring. The promoters are C. Cornish and W. Overton, of Selkirk.

The Courtwright Stove Co. is the name of a new stove and furnace manufacturing concern which proposes to locate at Courtright, Ont.

It is stated that Seattle capitalists are contemplating the establishment at Vancouver of a large manufacturing plant for locomotives and logging engines.

The Victoria Machinery Depot, Victoria, are enlarging the marine works damaged by fire some time ago. New boiler shops are being erected and an up-to-date plant installed.

The announcement that the American Can Company has acquired the Norton Can Company, Hamilton, has been confirmed by the heads of the latter company. Large additions to the plant are contemplated.

The Russell Harvesting Machine Co., have issued a prospectus of the Canadian factory to be situated at Woodstock. They will manufacture the Russell shocker which will fit any binder. It was invented by J. Russell, Hamilton, the head of the company.

The American Steel Range Corporation of Norfolk, Va., with a capital of $300,000, intend to commence manufacturing in Canada and establish a plant at Welland if arrangements can be made. The Canadian factory will be called the Stanford Steel Range Co.

James Maclean & Sons, Bryson, Pontiac County, Que., intend starting a machine shop at Bryson for the manufacture of oil engines, pumps, sawmill machinery, etc. They will require a number of machine tools but have not placed orders for them yet.

The Hamilton Nail and Wire Co., Hamilton, has purchased four acres of land at New Westminster, and will operate a large factory as soon as it is possible to do so. Raw material can be readily brought by the big liners which come to this coast regularly.

The Doty Engine Work Company at Goderich is preparing to erect several new buildings this season. The company has already commenced work on a new blacksmith shop and a new erecting shop is to follow, and after these are completed it is intended to proceed with the boiler shop.

It is understood that Jas. A. Moore, of the Moore Iron Works, Port Townsend, Wash., is negotiating for a site at Vancouver on which to locate immense iron works and possibly a steel plant. The investment planned contemplates an initial expenditure of at least $500,000.

TheDominion Government has accepted the tender of Haney, Quinlan & Robertson for the construction of the National Transcontinental terminal shops at St. Boniface. The amount of the tender, which was the lowest of those submitted, figures out to a total of about $869,000.

New Glasgow, N.S., is to have a new industry called the Harris Forge Co., capitalized at $25,000. Modern forge shop machinery will be immediately installed, to manufacture shape and drop forgings, for which there is a great demand, and practically no competition. The drop forging industry is an entirely new one in the Maritime Provinces.

One of the new industrial concerns that will open up in Montreal this spring is a shovel and sheet iron factory. Geo. Woolfe, of Glasgow, is making final arrangements to this end, and expects to have the necessary plant shipped from Scotland early in May. It will be a branch of the Glasgow factory, which is one of the oldest in its line in that city.

The new Burrill-Johnson Iron Company's buildings at Yarmouth, will be of brick and they will be equipped with the most modern machinery. Providing that the company secures certain concessions from the town they will engage in steel shipbuilding on an extensive scale. The company ask to have their rate of assessment fixed at a sum not more than $20,000, free water, and a free site for their shipbuilding plant.

The Smith's Falls Malleable Castings Co. opened their new foundry on April 12. The old one is working to its capacity and cannot conveniently handle the present business. This foundry was acquired about two years ago, but owing to the slump of 1907 was closed. It is now found necessary to open it and the two will be run to their capacity, giving employment to about 150 more hands.

Business promises to continue to keep booming at the plant of the Dominion Iron and Steel Co., at Sydney. This concern has been most successful in securing orders to keep the plant in operation. The Grand Trunk Pacific has just awarded the company a contract for one hundred miles of rails, and there is a possibility of securing another order for an additional one hundred miles for the same railway.

Municipal Enterprises.

Cobalt is to have a waterworks system.

A $1,250 sewer will be constructed on Dundas Street, Woodstock.

$20,000 will be spent for waterworks extensions at Fort Frances, Ont.

Hull, P.Q., will install new pumps in its waterworks plant, at a cost of $40,000.

Medicine Hat Council have decided to ask the ratepayers to vote $55,000 for sewer purposes.

The Goderich Council has decided to submit a by-law to the ratepayers to issue $20,000 waterworks debentures.

The Edmonton city council has passed a by-law authorizing the expenditure of $40,000 for sewer improvements.

The Alberni Waterworks Company has been incorporated to supply water for domestic uses to the town of Alberni, B.C.

The ratepayers of Claresholm, Alta., will be asked to vote a sum of $70,000 for a waterworks system and electric light plant.

At a recent meeting the Glace Bay, N.S., water committee recommended that $7,000 be borrowed for repairs to the town reservoir.

The Godson Contracting Co., Toronto, has the contract for constructing the first section (6,386 feet) of that city's trunk sewer, at $138,528.

Montreal's new waterworks system is expected to be completed in three months' time. Another million dollars will be raised to finish the work.

TheYorkton, Sask., council have adopted the report of the water and sewerage committee in favor of extending the system at an estimated cost of $50,000.

The Elk Creek Waterworks Co. are planning extensive improvements, including the laying of duplicate mains and the construction of a large reservoir at Chilliwack, B.C.

At a meeting of the executive committee of the Northwest Winnipeg Ratepayers Association, it was decided to ask for the immediate construction of water mains on Selkirk, Pritchard, Manitoba and Magnus streets.

It is estimated that $53,840 will be required by the Hamilton Waterworks Department for improvements, which include $25,975 for the beach pumphouse, $07,600 will be required for water works construction, this amount including $35,000 for extension of mains and $20,000 for new services.

The following contracts have been awarded for waterworks supplies for 1909 at Ottawa: Hydrants and valves, Thomas Lawson & Sons, Ottawa, $2,644; cast iron pipe, T. Sidney Kirby & Co. $15,065.10; lead pipe, McKinley & Northwood, $1,306.77; brass goods, James Robertson, Montreal, $987.95.

The Winnipeg civic board of works have granted the request of the National Transcontinental Railway for permission to lay a sewer emptying into the Red River. The length of the outlet is about 400 yards and it will cost $20,000. The cost of the sewer, five miles in length, which will be laid by the commission to the shops at Transcona, will be about $170,000.

Railway Construction.

The Nipissing Central Ry. will build and run an electric line in Haileybury.

An extension of the electric line at St. Thomas will be made to Aylmer.

The Montreal Street Railway contemplates making several extensions to its lines.

The Toronto Railway Co. will lay heavier rails on some of its routes this season.

The Blind River Colonization Ry. plans to build from Blind River, Ont., north to a junction with the G.T.P.

The C.P.R. are negotiating for St. John property upon which to construct yards and terminal facilities at a cost of $25,000.

The Simcoe Electric Railway Power Company are applying for incorporation to construct an electric railway from Midland to Coldwater, Ont.

The Hamilton Street Railway Company has made formal application for permission to start the work of laying the new tracks on James Street, that city.

The C.P.R. will double track their line between Smith's Falls and Peterboro, a distance of 133 miles, and carry out the construction of the direct grain route about 76 miles in length.

Extensive improvements will be made this summer to the Duluth extension of the C.N.R. Among other changes to be made, the track will be re-tied and ballasted and put in good shape generally. The bridges will also be repaired.

Important extensions to the northern and southern ends of the Chatham, Wallaceburg, and Lake Erie electric road are announced. The towns of Blenheim and Ridgetown on the south and Petrolea and Sarnia on the north will be tapped this summer.

Cobourg town council has granted the request of the Provincial Steel Company to construct a line of railway from its plant to the lake front. The Cobourg, Port Hope and Havelock Electric Railway Companies have also been granted franchises to enter that town.

The Cobalt Range Railway Co.'s bill was reported by the Commons Railway Committee. The company is authorized to construct the following lines: From Haileybury to Elk Lake via Bucke, Firstbrook, Barr or Hudson, Lundy, Auld, Cane or Henwood Barber, Tudhope or Bryce and James, thence to Gow Ganda Lake. From Ville Marie, Que., to Opasilica Lake, and thence to the N.T.R.

Electrical Notes.

The London Electric is quite willing to sell its plant to the city by arbitration as a going concern for $506,000.

The B. C. Electric Railway Company will establish a generating plant at Jordan River, forty or fifty miles from Victoria.

Acting on the advice of C. Mitchell, civil engineer of Toronto, the Prince Albert Council will proceed with the development of a million-dollar hydro-electric plant on the Saskatchewan River.

The boiler house, air compressor building, electric light plant and hoist house, together with all the machinery, with the exception of two dynamos, at Bruce Mines, Ont., have been destroyed by fire.

The North Regina Rural Telephone Company, of Regina, has been incorporated.

Calgary ratepayers have carried a by-law to raise $144,000 for the extension of the electric light.

The Beach Co., of Iroquois, Ont., have valuators out arranging to purchase a pole route for an electric power line from Iroquois to Brockville.

A by-law has been passed in Berlin, Ont., to issue $40,000 debentures for the Hydro Electric power scheme, also to issue $8,000 debentures for the extension of gas mains.

The Govan, Sask., Rural Telephone Co., has been organized and will apply for incorporation at once. It is the intention of the company to put up about 60 miles of line this summer.

The Northern Electric and Mfg. Co., have been awarded the contract for supplying and installing a Western electric alternator, exciter, and switchboard equipment for the town of Iberville, Que.

The Canada Automatic Machine Telephone Co. will be operating in Brantford, by May 1, according to the announcement of General Manager Mackay. The rates will be $25 for business and $15 per year for residential telephones.

Good progress is being made upon the construction of the new intake at the Edmonton power house. Two of the five lengths of pipe have already been placed in position, and the work completed is the most difficult part, as the pipe is under about eight feet of water in the centre of the river.

The following by laws have been passed by Edmonton ratepayers:—To raise $175,000 for electric light and power plant; $113,000 for water purposes; $13,000, fire equipment; $154,000, for improvements to municipal telephone system; $210,000 street railway extension; $47,000, for extensions to the electric light system.

At a meeting of the Brockville town council, Board of Trade, Trades and Labor Council, and Light and Water Commissioners, a resolution was passed that Mitchell Bros., consulting engineers, of Toronto, be requested to make a report relative to the cost of extensions, requirements and working economies of the light and water plant.

Wynn Meredith, who acted as consulting engineer for the British Columbia Electric Railway Co. at the time its plant on the North Arm of the inlet was installed, is in Vancouver consulting with the management of the company regarding the extension of its plant and improvement at Lake Buntzen.

A new schedule of electric light rates has been submitted to the Sherbrooke ratepayers. The most important changes are the following: Consumers will be charged at the rate of 5c. per kilowatt instead of 10c., as heretofore. There will be no rent charged for meters, and to make up for this, each person will have to furnish his own globes.

Calgary city commissioners have awarded to the Northwest Electric Company, a local concern, the contract for the supply of copper wire for the street railway. Contract price, $17,339.60. Other contracts which have been awarded are: Meter generator, set and switchboard Chalmers-Bullock Co., $15,950; 750 h.p. engine, Robb Engineering Co., Amherst, N.S., $11,300; 1,100 tons of steel rails, Gorman, Clancy and Grindley, Calgary, $70,000.

The lease of "Kai Kai Ke" and the "Island Rapids" groups of water-powers will be offered for sale at public auction in the sales room of the Quebec Department of Lands and Forests on May 11. The "Kai Kai-Ke" group is situated in the County of Pontiac and its power at low water is 32,980 horse-power. The "Island Rapids" group, whose power is 32,000 horse-power, is situated in the same county.

The B. C. Electric Railway Co. has decided to use aluminum in place of copper for transmission purposes on its Chilliwack line, and has let a contract for 390 miles to the Northern Aluminum Company, Montreal, for $45,000. This company is a Canadian branch of the Pittsburg Reduction Co. and has its works at Shawinigan, Quebec. This is the first time that aluminum will have been used in this district. At Nelson, B.C., a contract was let recently for 20 miles of aluminum wire which will be used for transmission purposes also.

A proposal was made to the Hydro-Electric Power Commission by gentlemen concerned in the electric railway project which is designed to connect Guelph and Stratford. Branches are also planned to Fergus and Elora and from New Hamburg to Woodstock via Plattsville. Eventually the road will come down to Toronto from the north-west. The system as at the present outlined covers some 150 miles, and the proposal made to the Commission is that the company should distribute Niagara power in such districts as the Hydro-Electric Power Commission does not penetrate. New Hamburg is prepared to bonus the company to the extent of $20,000 with the stipulation that it will undertake this work, thus bringing Niagara power into new fields. The company would use power obtained from the Hydro-Electric Power Commission for its own service.

Structural Steel Notes.

The Elgin county council awarded the contracts for two new bridges near St. Thomas. The Petrolea Bridge Co., and Hamilton Bridge Co., securing the contracts.

The Shore Line railway improvements in New Brunswick are being pushed along. Twelve steel bridges of a permanent character are either being constructed or planned.

Cornwall.—Tenders will be received until May 15th, 1909, for steel spans and concrete abutments for bridges. Address—Township Clerk of Charlottenburg, Cornwall, Ont.

Eleven bridges will be erected by order of the Middlesex county council this year. Work was commenced on the first of these a few days ago. It is situated near St. John's Ont., on the Proof Line road, and will cost in the neighborhood of $3,740.

The Alberta Provincial Government engineers have completed plans and specifications for a high level traffic and street railway bridge to be built at Edmonton at some point between Fourth and Ninth streets. The estimated cost of the structure is $300,000.

Damage to the extent of $25,000 has been caused at Port Hope by the over-flowing of the Ganeraska River. The following are some of the structures destroyed, viz., the Canton bridge, Helms' dam, the electric light plant footbridge, the Barrett's Hill bridge and the C.P.R. foot bridge.

At a meeting of the Navy Island Bridge Committee, in St. John, N. B., preliminary plans were submitted by F. W. Holt, C.E., for the proposed structure, which it is estimated will cost $750,000. The bridge will be a double decked structure, providing for railway, vehicular and foot traffic, and will be fifteen hundred feet in length.

Hon. John Morrissy, Chief Commissioner of Public Works awarded the contract for the remaining four spans of the Fredericton-St. Mary's bridge. The successful tenderers were the Dominion Bridge Co., of Montreal, and the four new spans will cost about $60,000. The bridge when completed will cost about $272,000, the original estimate by Engineer Wetmore having been $275,000.

Planing Mill News.

Maguire & Sutherland have started a saw mill at Duck Mountain, Sask.

R. D. Robison & Son are starting a sawmill and shinglemill just across the Fraser River from Eburne, B.C.

Hart & Carlaw, who recently took over the old Scott planing mill at Galt, are equipping it with modern machinery.

A wealthy syndicate, whose personnel has not been divulged, plans to build large sawmills at Esquimalt Harbor, B.C., at an expenditure of over $300,000.

The Building, Lumber & Supply Co., composed of well known Orillia men, will put up a large factory at Welland. The factory and yards will cover four acres.

The Tomiko Mills, have been incorporated to operate a sawmill on the Temiskaming & Northern Ontario Railway. G. B. Ferguson, of Renfrew, Ont., is president.

The Cleveland and Sarnia Lumber Co., have purchased from Waldie Bros., of Spragge, Ont., a lumber limit containing 250,000,000 feet of lumber and a saw mill, the latter to be moved to Sarnia. The price is $1,800,000.

The lumber industry is booming in Nova Scotia and all the mills are busy cutting the logs. In some districts tht cut promises to be heavy. Clark Bros., who have been operating at Bear River, will cut in the vicinity of four million feet. Large shipments are now going forward to European ports.

An indication of the gradual improvement of the lumber business on the coast is the starting again of the Pacific Coast Lumber Mills, one of the largest plants in Vancouver. The mill has been shut down for several months, and during that time has fallen back on its stock. This is about depleted. "If conditions were not better, we would not be starting so soon," was the remark of G. F. Gibson, manager.

A new industry is being established in Winnipeg by the Winnipeg Excelsior Mills, a company which has been formed for the manufacture of a wood fibre material used for packing. The mill is now in course of erection. The plant to be installed will have a capacity of six tons of excelsior per day and can be operated by fifteen men. White poplar, which is considered to be the best wood for the purpose will be used and the company had several gangs in the bush during the past winter getting out the wood. A quantity of wood was also got out last winter, one year's seasoning being necessary after the wood is peeled before it can be handled at the mills. The wood goes through various machines which reduce it to long threads of fibre, which are then baled ready for market. The manager of the mills, F. J. Wellwood, said that he expected the plant to be in operation by May 10.

Building Operations.

A new flour mill will be built at Dresden this year.

J. G. Stormes will erect a carriage factory at Shedden, Ont.

The Watt Coupler Co. may build a factory at Woodstock, Ont.

The T. Eaton Co. will build a twelve-storey factory to cost $250,000 at Toronto.

The Farmers' Elevator Co., have plans for the erection of a new elevator at Melita, Man.

A brick building is being built at St. John to be utilized as a bakery and knitting factory.

The McCormick Co. propose to erect a sash and shade factory at St. Boniface costing $15,000.

The Murray Shoe Co. has taken out a permit for the erection of a factory building at London.

The St. Thomas Canning Co. purpose establishing a branch factory at Ridgetown this summer.

Chas. Robertson, Winnipeg, will build a 35,000 bushel elevator at Claresholm, Alta., for the Vancouver Milling Co.

E. F. Hutchings, of the Great West Saddlery Company, Winnipeg, will erect a large warehouse at MacLeod, Alta.

K. Burnett, of Nanton, Alta., has secured a site at Vancouver on which he will erect a large grain elevator and warehouse.

Construction will shortly commence at Eburne, B.C., upon a large elevator to be erected by J. C. White, of Duluth, Minn.

The Canadian Industrial Company, of Vancouver, B.C., will erect a large paper and pulp mill on a site on the Powell river.

A Hamilton nail and wire concern and a Winnipeg metal fencing company will likely build branch plants at New Westminster.

It is reported that $250,000 has been bequeathed with which to erect a building at Toronto to be known as the Burns Memorial.

It is stated that the new building to be erected by the Banque Nationale at Montreal, will be ten storeys high and will cost $1,000,000.

The I.O.O.F. Hall Association have purchased property at Toronto on which they will erect a new lodge building, to cost at least $60,000.

Whitte Bros. & Co., of Newark, N. J., will next year build at Berlin a branch factory for the manufacture of cloth-covered buttons, and dies.

Stewart & Witton have purchased the old Central church property, at Hamilton, on which they will erect a building to be used for light manufacturing purposes.

It is understood that Stopes & Fuerstman, Saranac Lake, N.Y., are preparing plans for the erection of two sanitariums, one at St. Agatha, and the other at Quebec.

Mayor Robinson, of Kamloops, B.C., has presented a scheme for the erection of a new city hall and the carrying out of other public works at a total cost of $100,000.

The East City Furniture Factory, Peterboro, is to be enlarged during the coming summer. An addition one-half the size of the present building will be built to the rear.

It is reported that the T. Eaton Co. has secured lots at Calgary, with a view to erecting a large departmental store. It is expected that the sum of $500,000 will be expended on site and building.

It is stated that plans have been practically completed for the erection of a new $3,000,000 hotel on Phillips square, Montreal. The present lesses of the St. Lawrence Hall are stated to be interested.

Taylor & Taylor, Brantford, are preparing plans for an addition to the factory of Gould, Shapley and Muir, that city, and for the proposed new factory for Harold Sanderson, at Paris, Ont.

There will be between 30 and 35 new elevators under construction along the G T P within a few weeks, according to a statement made by J. E. Dalrymple, assistant freight traffic manager of the road.

Jos. Sawyer, Montreal, has prepared plans for a three-storey building to be erected there

for F. Harel. It will have electric lighting, open plumbing, hot water heating and metal ceilings. Cost of building, $55,000.

E. LeRoy Wills announces the formation of a syndicate of prominent Montreal and Sydney capitalists, with capital of $150,000 for the purpose of enlarging and reorganizing the Sydney, C.B., hotel. Salt water baths will be installed.

A number of passenger depots will be built along the line of the G.T.P. this summer. They have already been built at divisional points, but the next move will be to supply all the towns that have shown reasonable development. This work will be started in a few weeks.

George White & Sons, London, have postponed until next year the erection of their new $50,000 building, owing to Niagara power not coming here this year. Next year, Niagara power, or no Niagara power, the building will be gone on with. Meanwhile the firm will proceed with the erection of a warehouse in Brandon, Man., and a large lumber house in London.

General Manufacturing Notes.

John McKinnon has started a wood-working business in Wapella.

The stamp mills at Hedley, B.C., are again running. Forty stamps are in operation.

The Crescent Oil Company will erect a warehouse in the north eastern part of Hamilton.

Detroit capitalists are said to be about to establish automobile works at Sarnia this year.

H. A. Metler, St. Catharines, proposes to establish a basket and box factory at Beamsville.

Geo. Pedlar, of the Williams Organ Co., Chicago, proposes building an organ factory at Sarnia.

The North American Bent Chair Company are making extensive additions to their buildings at Owen Sound.

The Reid Press, will, it is understood, very shortly erect a $25,000 addition to their plant at Hamilton.

Among the important undertakings in view in the building line in Hamilton are a new building for Wagstaffe, Limited.

It is understood that the New Westminster Board of Trade will take active steps toward the establishing of an elevator there.

The E. Long Mfg. Co., wants to build a new factory doubling its present capacity and has asked the Orillia council for a free site.

The Speight Wagon Co., Markham, Ont., is having some difficulty in getting hands, so great is the pressure of work at their factory just now.

Shaw & Mason, Sydney, C.B., makers of Colonial anti-friction metal, will build a branch plant in the U.S., to look after orders arising in that country.

The Pedlar Manufacturing Company, Oshawa, have bought a building at Toronto, and after making extensive alterations will occupy it as a sample room and warehouse.

The Durham Furniture Co. has made a start at the biggest pile of logs Durham ever saw. It is estimated that there is probably in the neighborhood of 1,100,000 feet stocked up.

A number of St. Mary's and Owen Sound capitalists intend to form themselves into a cement company, and have taken a number of options on rock and clay land near St. Mary's.

E. M. Archibald is at present engaged in preparing plans for the Canada Iron Corporation, for their Torbrook iron mine development in Annapolis Co. They propose to develop an output of one thousand tons per day.

The Zymole Co., a New Jersey chemical concern, has been granted a license to manufacture pharmacal, toilet and other proprietary preparations in Ontario. The company's Canadian factory is at Windsor.

The McLeod Pulp & Paper Mills have started to make box board at Milton, Ont., and intend to manufacture paper in the near future. The pulp mills of the company are busy and are turning out about 80 tons of pulp a day.

The reported curtailment of the B. C. copper smelters is hardly correct. The Granby smelter is operating seven of its battery of eight furnaces at the present time, and has increased its capacity 25 per cent. during the past year.

Representatives of a big American packing house have been in West Toronto spying out the land in the vicinity of the local abattoirs, and it is understood that before very long the foundation will be laid of another big abattoir.

The Canada Smallwares Co., St. Mary's are getting in a large amount of new machinery. The building has been fitted with a steam heating plant recently and Manager McCrimmon expects it will be ready for operation within a short time.

It is stated that Campbellford is to have a pulp manufacturing company which will employ a large number of hands, and that the building will be erected in the proximity of the Northumberland Paper Mills, operations to commence in the near future.

The manufacture of dynamite at the Dunbar & Sullivan factory in Amherstburg commenced a few days ago. It is anticipated that not so much of the explosive will be required this year as last as the lake drilling will necessarily be harder and slower.

Work has been proceeding on the Selkirk, Man., Match Company's factory rapidly and the building is now nearly completed. Matches will be made from poplar wood, and the company are buying up large quantities of it now for their summer operations.

Nanaimo city council have been asked for cheap water and exemption from taxation for a few years by Wilson & Flumerfelt for the Vancouver Briquette Co., which is to build a $35,000 factory in Nanaimo, work to start immediately. Briquettes are manufactured from slack the waste from coal mines.

As an instance of the trade into Vancouver shipments by the Blue Funnel liner Oanfa, now unloading at Evans, Coleman & Evans' wharf, might be mentioned. On the manifest are 3588 ingots of pig tin, worth $105,560; 49,924 boxes tin plate, worth $250,000; 720 slabs of tin and 244 pieces of pig lead.

A. D. Dame, sales-manager for the Galt Art Metal Co., who has recently returned from a trip to the Pacific coast, reports that business in the west is exceptionally brisk. The Galt factory is running 24 hours a day and unable to keep up with the orders. Additional machinery is now being installed.

The Sydenham Glass factory at Wallaceburg was visited by a disastrous fire a few days ago in which nearly the entire plant was destroyed. The office, flint house, box factory and the new building in course of construction were the only portions saved, some ten buildings being burned to the ground. Manager T. B. Dundas estimates the loss at $125,000, which is understood to be entirely covered by insurance.

The fact that the Chatham Wagon Co. has practically decided to double the capacity of its present factory is taken as an encouraging sign of industrial recuperation. A two storey building is contemplated. The present capacity is 4,000 wagons and sleighs yearly, but with the building of the new addition and the installation of new machinery the company will discontinue the manufacture of sleighs, and devote its sole attention to wagons, the output of which will be increased to 8,000 a year.

The Manitoba Linseed Oil Mills Co., have opened their $75,000 plant at St. Boniface. The new mill, which has a daily capacity of 2,500 gallons, will be in continual operation. The plant comprises a combination frame and cement flax seed elevator of 30,000 bushels capacity. The seed is automatically carried from the elevator to the cleaner and thence into the crushing rolls and afterwards to the expeller. It is then automatically weighed into the rolls and the oil and cake meal are similarly weighed before they go into storage. From a bushel of seed weighing 56 pounds the proportion is 18 pounds of oil and 38 pounds of cake. Even the bagging machinery for the cake is automatic so that machinery is used in every place possible though there is a staff of about a dozen men engaged in the mill. There are five of the expellers or oil machines and the building is planned so that the capacity can be readily doubled.

Gas Items.

A storm early in April wrecked 50 derricks in the Tilbury oil fields involving a loss of $15,000.

The Imperial Gas Power Co.'s factory at Swansea, near Toronto, was damaged by fire recently. The company makes gas engines and wringers.

An important deal recently took place whereby the East Tilbury Canada Oil Fields, an English concern, took over about a dozen oil properties. A big movement toward the development of the field is anticipated.

One of the municipal gas wells at Medicine Hat, has been sunk to a depth of 965 feet, and a tremendous flow of three million cubic feet per day has been developed. Experts expect that this will eventually rival the famous C. P.R. gusher at Bow Island.

The terms on which the Volcanic Oil & Gas Company may be allowed to pipe natural gas to Windsor have been decided on between the city council and the promoters of the company. The franchise will contain a clause giving the company the right to sell to the Windsor Gas Company. It is stipulated that the gas must be refined, and the original prices outlined are increased slightly on this account. The maximum is 35 cents instead of 30 cents a thousand, with an increase to 40 cents at the end of the first five years and a further increase to 50 cents at the end of the second five years. The company will use eight and ten-inch mains to bring the supply from the Tilbury fields, and will lay only one line. Six months is set as the time limit for reaching the city. The company has agreed to pay $1,000 of the cost of submitting the franchise to a public vote.

Trade Notes.

Jones and Glassco, Montreal, have moved into new offices in the St. Nicholas Building, room 201.

Southern Wisconsin Foundry Co., Madison, recently installed a ten ton Northern Crane, 50' span, for their new foundry.

John Millen & Son, Montreal, have been appointed sale agents for the Simms British Magnetos for the Dominion of Canada.

The Premier Electric Light & Power Co., Wallaceburg, has installed a new boiler, manufactured by the Leonard Co., London.

The Allis Chalmers-Bullock Company has been given the contract for putting in the turbine and generator at the Nelson power plant to complete the second unit at Bonnington Falls. The cost is about $75,000.

The Milroy Co., formerly the Milroy-Harrison Co., 196 King St. West, have enlarged their offices by taking in the adjacent store. The increased business necessitated the enlargement which will now allow them to carry larger stocks.

The Brandon Machine Works Co. is just completing two steel cages for the W. J. D. gaol. The cages are made of heavy boiler plate securely riveted together and the iron grating in front as well as the lock is ponderous in the extreme.

Fisher furnaces manufactured by Alfred Fisher, 103 West Munroe St., Chicago, have lately been installed in the plants of the following Canadian firms: Sommerville Ltd., Toronto; Penberthy Injector Co., Ltd., Windsor, Ont.; The Wolverine Brass Works, Chatham, Ont.

The Toronto Iron Works has put up the large standpipe installed in connection with the new waterworks system at Guelph, Ont., which is said to be the largest reservoir of its kind in Canada, the capacity being 500,000 gallons and the dimensions 30 feet in diameter and 160 feet high.

John Millen & Sons, Montreal, have added to their lines of automobile and bicycle block and roller chains, a complete line of transmission chains made by the Coventry Chain Co., Ltd., Coventry, England. These consist of block, roller and silent chains in all sizes and types. They will shortly put on the market a chain specially manufactured for use in fire proof buildings where metal sashes are employed, replacing the ordinary window cords. Special sprockets to suit the chain will be carried in stock.

One of the largest contracts for cement ever placed in the Dominion of Canada, has just been placed by the Frank B. Gilbreth organization with the Vulcan Portland Cement Co., Longue Pointe, Que., through their agents the William G. Hartranft Cement Co., Ltd., Montreal. The order covers the entire cement requirements for the work and will amount to nearly 100,000 barrels of cement which will be tested at the company's storage bins, where it will be reserved under seal and shipped in carload lots to the job as required, thus assuring the contractor that the cement will be up to the standard requirements when received.

New Companies Incorporated.

The Berlin Table Mfg. Co., Berlin, capital $40,000; to manufacture furniture. Incorporators, W. May, H. T. May and J. Wurm, Berlin.

The C. J. Daniels Milling Co., Toronto; to manufacture poultry foods. Incorporators, C. J. Daniels, S. C. Daniels and W. H. Pettit, Toronto.

Ottawa Typewriter Co., Ottawa; capital, $40,000; to manufacture stationery. Incorporators, E. E. Batty, F. X. Laderoute and A. K. McLean.

The Standard Combination Motor Rim Co., Toronto; to manufacture automobiles. Incorporators, J. S. Lovell, W. Bain, and R. Gowans, Toronto.

St. Clair Construction Co., Toronto; capital, $40,000; to do construction business. Incorporators, J. L. Ross, A. W. Holmsted and W. L. Carr, Toronto.

National Iron Works, Toronto; capital, $200,000; to manufacture iron and other metals. Incorporators, A. Mullin, F. Lane and T. A. Silverthorne, Toronto.

Mace Mfg. Co., Montreal; capital, $20,000; to manufacture ice cream freezers and novelties. Incorporators, A. H. Mace, R. T. Heneker and A. H. Duff, Montreal.

St. Lawrence Paper Mills, Ltd., Cornwall; capital $150,000; to manufacture pulp and paper. Incorporators, F. N. Johns, G. H. Sedgewick and L. Davis, Toronto.

The Ontario Lime Assn., Toronto; capital, $50,000; to manufacture sewer pipe, cement, etc. Incorporators, G. H. Kilmer, J. A. McAndrew and W. H. Irving, Toronto.

Ontario Sanitary Mfg. Co., Windsor; capital $40,000; to manufacture plumbing and sanitary supplies. Incorporators, F. A. Black, R. H. Evans and H. L. Evans, Detroit.

Muskoka Sand and Gravel Co., Toronto; capital, $40,000; to manufacture cement. Incorporators, W. Sandford, New York, and G. A. Marchant and H. L. Dunn, Toronto.

Mines Power, Ltd., Montreal; capital, $3,000,000; to carry on power, heat and light business. Incorporators, E. A. Wallberg, E. C. Warren and J. R. Nichols, Montreal.

The Dominion Sugar Co., Berlin; capital, $200,000; to extract, refine and manufacture sugar. Incorporators, A. Leslie, H. L. McDowell and B. Harrison, Walkerville.

The Wizard Furnace Co., Toronto; capital, $100,000; to manufacture heating apparatus of all kinds. Incorporators, J. E. Denise, C. E. Howarth and W. M. Weekes, Toronto.

Maple Leaf Portland Cement Co., Toronto; capital, $50,000; to manufacture cement, oils, paints and stones. Incorporators, H. Riley, J. E. Riley and E. C. Ironside, Toronto.

The Chaudiere Supply Co., Ottawa; capital, $20,000; to manufacture machinery and tools of every description. Incorporators, A. Wilson, G. G. Roe, and B. B. Pannett, Ottawa.

Leach & Sons, Co., Kemptville, Ont., capital, $40,000; to manufacture machinery and articles of iron and steel. Incorporators, Z. Leach, G. A. Leach and S. J. Martin, Kemptville.

The Marceline Company of Ontario, Toronto; capital, $3,000 to deal in metals and machinery. Incorporators, Marcel Wormser, New York; and B. Frank and M. L. Lowenthal, Buffalo.

Silver Lake Lumber Co., Eastman, Que; capital, $100,000; to manufacture lumber. Incorporators, D. McMartin, Montreal; W. A. Cromwell and J. S. Rayside, Eastman, Que.

The Blakely Oil Co., Chatham; capital, $25,000; to develop and treat ores, metals and minerals. Incorporators, S. L. Blakely, R. L. Gosnell and P. S. Shillington, Blenheim, Ont.

The Unicell Bell and Signal Co., Montreal; capital, $19,000; to make electric bells, annunciators, batteries, etc. Incorporators, R. T. Heneker, A. H. Duff and W. S. Johnson, Montreal.

The National Boiler Washing Co., Montreal; capital, $250,000; to manufacture and instal machinery. Incorporators, F. H. Hopkins, R. A. E. Greenshields and R. A. C. McNally, Montreal.

The Maritime Engine Co., St. John; capital, $125,000; to construct and repair engines of all kinds. Incorporators, D. J. Purdy and H. R. McLellan, St. John, and J. A. Calhoun, Savannah, Ga.

The Boeckh Bros. Co., Toronto; capital, $250,000; to manufacture woodenware, brushes, brooms, paints and metalware. Incorporators, J. C. Boeckh, C. McC. Farringer and A. W. Wills, Toronto.

MacArthur, Perks & Co., Ottawa; capital $250,000; to engage in construction business. Incorporators, A. F. MacArthur, New York, R. W. Perks, London, Eng., and G. W. Volckman, Ottawa.

The Parry Sound Mica Felspar Co., Toronto; capital, $100,000; to crush and treat ores, metals and minerals. Incorporators, F. L. Young, A. Bergquest and J. G. Harris, Minneapolis, Minn.

The Chatham Wrench Co., Chatham, Ont.; capital, $10,000; to manufacture machinery, tools and hardware specialties. Incorporators, R. J. McG. Gardiner, W. D. Sheldon and J. Hadley, Chatham.

Maw Brakes, Ltd., Montreal, capital, $100,000; to manufacture the Maw patent brake and conduct general manufacturing business. Incorporators, H. Timmins, R. J. Dale and P. W. McLagan, Montreal.

The Wm. Cane & Sons Co., Newmarket; capital $250,000; to take over and conduct the woodenware business of the United Factories at that town. Incorporators, W. H. Cane, L. P. B. Cane and V. E. Cane, Newmarket.

The Severn Power Co., Toronto; capital, $150,000; to construct and develop a water power and deal in electric heat, light and energy. Incorporators, W. Graham, T. E. McCracken and J. R. Roaf, Toronto.

The International Grain Shocker Co., New Liskeard; capital, $40,000; to manufacture agricultural implements and shockers. Incorporators, R. S. Macpherson, W. J. Emerson and B. Carruthers, New Liskeard.

La Cie Bedard, L'Assomption, Que.; capital, $95,000; to take over and conduct the business of T. Bedard, manufacturer of stoves and agricultural implements. Incorporators, T. Bedard, J. D. Martineau, and R. Labreche, L'Assomption.

Welland Tin Plate and Sheet Co., Welland; capital $150,000, to manufacture tin plate, terne plate, Canada plate, polished blue steel for stoves, galvanized sheets and steel sheets. Incorporators, J. Huxley, Pittsburg; A. B. Spencer and B. J. McCormick, Welland.

The Calgary Windmill & Pump Company, Calgary; capital $50,000, will erect in the near future a large factory for the manufacture of pumps, windmills, saws, etc. The officers of the company are: Thomas Armstrong, President; John McGowan, Vice-President; D. D. McGillvray, Secretary and General Manager; R. A. Brocklebank, Director.

Gas Appliances Wanted.

Siege Social & Ateliers de Construction, 106 and 108 Rue de Lourmel, Paris, France, write Canadian Machinery that their company owns 26 gas works in France and desiring to increase the consumption are in search of all appliances for lighting, heating or other domestic or industrial purposes. They ask for particulars and price lists from any Canadian firms who wish to introduce their goods in France.

Largest Shot Tower in Canada.

The Canada Metal Company, Toronto, have purchased from Somerville, Limited, Toronto, the shot tower and machinery located at the latter company's works, and will remove the plant to their new factory site near the Exhibition grounds, that city. A tower 200 feet high, the largest in Canada, will be erected and the machinery will be brought thoroughly up to date in order to produce a superior quality of shot.

Listowel to Have New Electric Plant.

By a large majority Listowel carried a by-law to instal an efficient electrical system at an approximate cost of $13,000. The central station and the 265 Tungsten lamps will be installed under the direction of C. H. and P. H. Mitchell, consulting engineers, Toronto. The central station contains in addition to the present equipment, a Robb-Armstrong high speed engine and one Swedish generator. Tungsten lamps will be used for both street and indoor lighting.

First Creosote Mill in Canada.

A one hundred and fifty thousand dollar company, nearly all of whose shareholders reside in the United States, recently established a plant at Weedon, on the Quebec Central Railway, for the manufacture of creosote, the first of the kind in Canada. The same management operates a creosote factory in New Hampshire. Wood alcohol and charcoal are first produced from the wood. The tar refuse is converted by a secret process into creosote. All kinds of hard wood are used. The reason for locating at Weedon was to be near a cheap wood supply.

A $10,000,000 Paper Mill.

An area of a thousand square miles on the south coast of Newfoundland has been purchased by a New York concern, as a result of negotiations with the new Morris ministry, and it is announced that it will be made the centre of extensive paper making operations. It is understood that the plans provide for the erection, at a cost of about $10,000,000, of a plant with a capacity of 450 tons of paper daily. The locality includes a port which is free from ice all the year round, and it is said after the plant is in operation there will be a regular weekly steamer service between Newfoundland and New York.

Will Build Large Plant.

As stated in our April issue the Standard Sanitary Mfg. Co., Pittsburg, will locate in Toronto. They have purchased the jobbing house of the Sommerville Co., Ltd., in Toronto, Can., and will continue the business under the name of the Standard Sanitary Mfg. Co., a Canadian corporation, which will be subsidiary to the American company. Papers of incorporation of the new company have been taken out under Canadian laws. The Standard company has also in contemplation the erection of a large plant in Canada which will be of a size sufficient to meet the demands of the Dominion trade.

Canadians Interested in Mexican Waterpowers.

Headed by Dr. B. Franklin Pearson, a Canadian syndicate has secured a concession from the Mexican Government for the construction of two dams on the Conchau River, at a cost of approximately $8,000,000, and will produce gold. The upper dam, for the purpose of generating electric power for lighting and manufacturing, will cost two and a half millions, and will produce power for Santa Rosalia, Parral and neighboring towns. The lower dam will cost between five and six million dollars and will be devoted to flood water irrigation for three hundred thousand acres of farming land in Concha valley. Construction on this dam is to start this year, and will be completed in three years.

Maple Leaf Harvest Tool Co., Tillsonburg.

Announcement has been made that the Maple Leaf Harvest Tool Works, Tillsonburg, owned principally by residents of Galt, have been acquired by the American Fork Trust, which controls all similar factories in North America, except one in Canada and one in the United States. The trust had no factory in Canada previous to the deal being made.

The intention of the trust is to manufacture export goods at Tillsonburg and the plant will be increased to four times the present capacity. The secretary-treasurer of the old company, C. K. Jansen, will manage the Canadian concern, and still retains his stock in the business.

New Metal Company.

The Hoyt Metal Co., St. Louis, Mo., has opened a Canadian branch to look after its trade in this country and has established a small plant containing six kettles on the Don Esplanade, Toronto, where are manufactured babbit metal, stereotypers' metal and solder. If the product meets with favor and the trade proves worth while it is likely a large plant will be built in Ontario within two years' time, wherein will be manufactured a great many white metal lines, especially pipe, bends, sheet lead and white lead and perhaps a shot tower will be added.

G. E. Allen, chemist and metallurgist of the company, who was, until last December, superintendent of the Hoyt Metal Co.'s plant at Granite City, Mo., is in charge of the Toronto plant.

Big Transcontinental Bridges.
